WINTER RUNS.

THE MOTOR CYCLE

1D

Largest Circulation.

Founded 1903.

No. 458. Vol. 10. THURSDAY, JANUARY 4th, 1912.

REGISTERED AS A NEWSPAPER FOR TRANSMISSION IN THE UNITED KINGDOM.

Price 1d. Published Weekly.

ALL THE BEST POINTS

and the newest improvements of the most famous Motor Cycle Manufacturers for 1912

are included in the great show of up-to-date models now to be seen at

You can see them all in our Showrooms, where we exhibit the largest stock of New and Second-hand Motors, all of which we offer for exchange or cash at prices that cannot be beaten.

TO-DAY'S BARGAINS INCLUDE:

4747. 3½ h.p. 1911 Standard **TRIUMPH** ..£38 0
4759. 3½ h.p. 1910 Two-speed **BRADBURY** £37 10
4760. 5 h.p. 1911 F.E. **INDIAN** .....40 Gns
4768. 2¾ h.p. 1911 **DOUGLAS** £30 0
4769. 5 h.p. 1908 Two-speed **TWIN REX DE LUXE** and Sidecar .....28 Gns
4776. 3½ h.p. 1911 F.E. **TRIUMPH** £45 0
4785. 2¾ h.p. 1911 Lady's **DOUGLAS** £38 0

Kerry-Abingdon MOTOR CYCLES.

1912 MODELS.

TWIN-CYLINDER.—5-6 h.p. **57 guineas.**
STANDARD.—3½ h.p. .. .. **45 guineas.**
DROP FRAME.—3½ h.p. .. .. .. **45 guineas.**
2-SPEED AND FREE ENGINE.—3½ h.p. .. .. **54 guineas.**
FREE-ENGINE CLUTCH.—3½ h.p. **51 guineas.**
SIDECARS.
Populars, Wicker body **£6-6-0; £7-15-0**
De Luxe **£8-15 0; £11-11-0**

GENERAL SPECIFICATION.

ENGINE.—M. O. valves. Very flexible. Standard sizes throughout. Wearing parts accessible.
SINGLE-CYLINDER.—3½ h.p. Bore 85 mm. Stroke 88 mm. Ball bearings for crankshaft.
TWIN-CYLINDER.—5-6 h.p. Bore 67 mm. Stroke 95 mm. Cylinder at 50°. Ball bearings on pulley side of crankshaft. Large silencers, with Abingdon cut-out. Lubrication specially efficient.
CARBURETTER.—Brown and Barlow. H.B. contro.
IGNITION.—Bosch enclosed type magneto.
TRANSMISSION.—By belt. Adjustable pulley.
TANK.—Extra large fillers. Special petrol valves. Compound partitions.
SPRING FORKS.—Strong, graceful and efficient.
CARRIER.—Strong tubular; fully equipped.
TYRES.—26×2¼ and 2½in. Rubber studded. Extra heavy.
SADDLE.—The Middlemore "Rideasy."
A King Dick Bulldog Mascot, a Kerry-Abingdon Tube and Belt Carrier, and a Lea Reflex Light, are fitted to every machine free of charge.
COMFORT.—Handle-bar extra strong and long, to be easily reached when sitting right back.

Every machine is tested on the road before delivery.

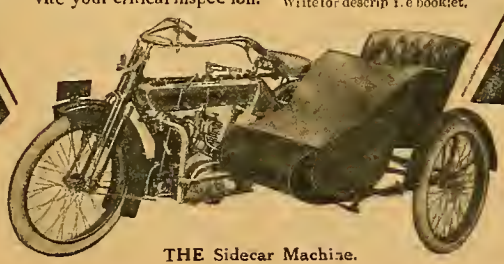
Chater Lea No. 7



has again eclipsed all other sidecar machines in open competition. Just the same as usual, no failures among No. 7 riders, 100 % wins every time.

LONDON — EXETER — LONDON

Note the fine performance of the Chater Lea No. 7. and sidecars (Three out of the four starters were amateur owners). There is no fluke about such a result as this.

4 Started, 4 Golds

Here is convincing proof that for all-weather sidecar work over difficult country the No. 7 stands quite alone. Buy the sidecar machine of proved reliability and endurance; proved beyond doubt and backed by a famous name. That machine is the Chater Lea No. 7, and we invite your critical inspection. Write for descriptive booklet.

THE Sidecar Machine.

EVERY STARTER A WINNER.

That's something like a win; not an odd one out of many, but four out of four. Just the same as last season—highest possible award every time.

Write for Descriptive Booklet.

CHATER LEA, Ltd., Golden Lane, London.

THE AMATEURS' COMBINATION.

Notice the number of amateur owners who run their Chater Lea No. 7 and Sidecars in competition—and win. These are the performances of interest to the private buyer.

Write for Descriptive Booklet.

Winter Runs.

THE popularity of winter holiday runs shows little sign of decreasing, if one may be allowed to judge by the number of competitors who took part in various club events in different parts of the country during last week. Whilst admiring the enthusiasm and grit of those who are willing to remain in the saddle for long hours while their machines traverse miles of muddy roads by night and day, one cannot fail to be impressed with the fact that the descriptions of the runs published in this issue are a severe indictment against the lack of cleanliness in the case of the average motor cycle.

The wheels of a motor cycle which have to revolve through seas of mud for hour after hour must necessarily become unrecognisable as articles of metal and rubber, but surely some form of efficient mudguarding should be evolved to prevent the rider and the vital parts of the mechanism from being liberally coated with mud splashings in a few miles from the start of a long distance winter event.

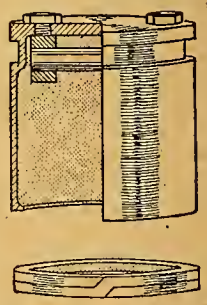
There are special forms of mudguard made for motor cycles which are fairly satisfactory in preventing what was so apparent in last week's events, but few riders took the trouble to make use of them. They entail some extra weight and are somewhat cumbersome, consequently the majority appeared to prefer to get dirty or, at the best, to improvise some form of makeshift guard which usually proved inadequate. This is a drawback to the pastime, and it raises a question whether it could not be overcome by making a more complete form of mudguard extension which could be supplied to order for all weather riding. The attachment might be combined with removable footboards, and correspond to their overall width, so that when the footboards were connected across, behind, and in front of the engine, a continuous wing from front to rear would be extended between the rider and the road.

That some machines are very much cleaner than others on winter roads is due to the fact that their designers ride year in and year out, and have the necessity of adequate mudguarding forcibly brought home to them. The average motor cycle is, however, still very much wanting in this respect.

Cost of Production.

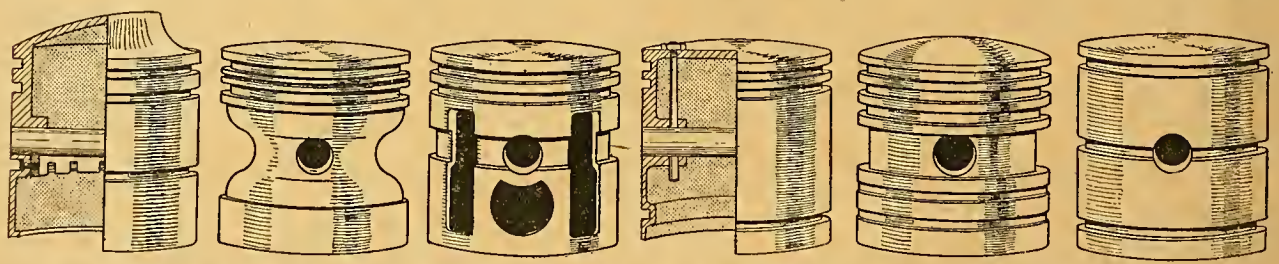
IT is, perhaps, natural for those who are only concerned with the riding of motor cycles, and not with their manufacture or sale, to imagine that as the years advance prices should become easier. A correspondent this week voices this view, and complains of additions to the rider's comfort and increased efficiency of working being charged as extras. In most articles of commerce rapidity of production does spell a lowering of prices, but the motor cycle industry is not an ordinary one, and the prices of machines must remain stationary or show a tendency to increase with the general improvements that are demanded every year.

With regard to the charges for extras, items such as clutches and change-speed gears increase the cost of production enormously. They are not always charged as extras, but are included in the price of many machines, the total cost naturally being high in comparison with those mounts which are not provided with such aids to comfort in touring or passenger work. If our correspondent were to see the work entailed to produce a perfect change speed gear, we do not think he would consider their price extortionate.



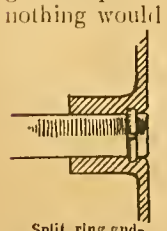
Examples of Modern Piston Design.

DURING the year we have heard a good deal about pistons, more especially just prior to the Tourist Trophy Race in the Isle of Man, when experts of several countries were trying their best to get the last ounce of power out of their mounts. Now a piston that will stand up to the strain of such a long race as the T.T. without warping will stand any ordinary use on the road, and as lightness is an important factor in a high speed piston it is not surprising to find that there is a general tendency towards lighter pistons in the 1912 touring mounts. Excepting for short-distance races, the steel piston is rapidly dying out, and I do not think it will ever become standard practice on motor cycles, for, although it can be made extremely light, it has the great disadvantage of warping after hard use in an air-cooled engine.



Why a Light Piston is Desirable.

There are several good reasons why a light piston is to be desired for high engine speed. Possibly the most important is that the piston is a reciprocating mass, and therefore cannot be accurately balanced in a single-cylinder engine, and it is probable that a carefully designed cast-iron piston can be made to weigh very little more than one made of steel.



At the recent Olympia Motor Cycle Show I made enquiries about steel pistons of a firm which has had great experience on the subject, and was told that nothing would induce them to fit another steel piston, even for racing purposes. This experience speaks for itself. For touring mounts, the steel piston has yet another disadvantage, and that is that, owing to unequal expansion, the piston has to be made a very slack fit in the cylinder, as much as ten-thousandths being allowed, even in water-cooled engines. This is apt to cause rattle, and prevents the piston from assisting the rings to hold compression. These remarks, of course, apply to pistons machined out of solid steel, and not to those employed by the Hendee Manufacturing Co., and fitted to the Indian motor cycles. These pistons are very light, and are made of castings, annealed by a special process till they have the good points of a steel piston without its disadvantages. This piston has two rings at the top separated by a narrow but deep oil groove, and in the neighbourhood of the gudgeon pin the diameter of the piston is greatly reduced. This reduction serves to lighten the piston, and acts as a strengthening web to the gudgeon pin bosses. The gudgeon pin fixing is unusual, but should be very effective. A peg is driven through one end of the pin, and drops into grooves cut in the piston, thus preventing rotary movement, while sidewise motion is prevented by a split pin which passes through the supporting boss and is opened out inside the hollow gudgeon pin.

Showing the M.R. gudgeon pin fixing, and double piston ring.

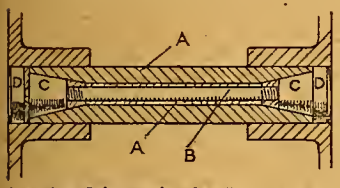
(1) Showing gudgeon pin fixing and position of rings on Scott two-stroke engine. There are two top rings. The gudgeon pin is held by a wide central ring. (2) Indian, two rings at the top. Note the cut away piston walls. (3) Blumfield piston used on water-cooled engines. There are two top rings. The gudgeon pin is held by a wide central ring. (4) Excelsior, two rings at the top and one at the bottom. The gudgeon pin in this case is fixed by a taper pin extending through the piston head. (5) N.S.U., three rings at the top. The gudgeon pin is secured by a wide ring in the centre. Two oil grooves at foot. (6) New Hudson, three rings spaced equally, the centre one retaining the gudgeon pin.

Split ring gudgeon pin fixing employed on the B.S.A.

The Number of Rings.

On the question of the correct number and position of piston rings, manufacturers' opinions differ so widely that it is almost impossible to say what is the most usual practice, but probably two rings, both at the top of the piston, are to be seen most frequently.

The Moto-Rêve piston is well worth attention on account of somewhat unusual construction. There are no gudgeon pin bosses in the usual sense of the term, but the pin is carried on a pair of lugs which pass through the piston head, and are locked in position by nuts. This construction allows of extreme lightness, as the piston can be machined all over, both inside and out. Only one ring is used by this firm,



Examples of Modern Piston Design.—

and this is of the double type, the design of which can be easily followed from the accompanying sketch.

The Humber lightweight is another instance of the employment of a single piston ring. This construction should be very suitable for lightweight engines which run at comparatively high speeds, for the design lends itself to lightness, and at normal revolutions the extremely small amount of gas which might leak past the ring is negligible. However, it is easy to see that a broken ring would place one's machine *hors de combat*.

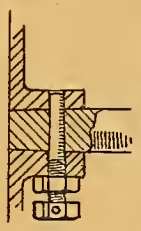
The Lower Ring Losing Ground.

In a few instances two rings are fitted, one at the top and one at the bottom, but this practice is not so common as it was a year or two ago, probably because the bottom ring tends to scrape the oil from the cylinder walls, thus interfering with piston lubrication. This trouble is occasionally avoided by drilling the piston above the bottom ring. In this case the bottom ring obviously is intended as a bearing only, for any gas that passed the top ring would escape through the holes in the piston. The design should be very suitable for racing work.

Ingenious fixing employed on the S.I.A.M.T.
A. Gudgeon pin split at each end.
B. Rod threaded at each end.
C. Cone screw heads.
D. Brass washers.

In the case of the New Hudson engines, three rings are employed—one at the top, one holding the gudgeon pin in place, and one at the bottom.

The Excelsior has two rings at the top and one at the bottom, but in this instance the bottom ring tends to keep the oil on the piston walls as it is fed in through the side of the cylinder and into the hollow gudgeon pin.



The only instance of three top rings which I chanced on at the Show was on the N.S.U. motor cycles.

An extremely light piston is used on the Blumfield water-cooled engine. It has two top rings, and has its walls cut away to a much greater extent than is usual on a standard machine.

The Norton piston is noticeable for several reasons. Two very wide top rings are used, and the diameter of the piston is greatly reduced round the centre; a continuous ring of oil grooves is also placed round the lower half. The rings themselves have oil grooves cut in them.

Security for the Gudgeon Pin.

Gudgeon pin fixing affords great scope for ingenuity, and many and various are the devices fitted. Perhaps the most common method is that of fitting the pin, which has a slightly tapered end, into a corresponding hole, and fixing it in position by a taper-ended set-screw.

A very common fixing. One end of the gudgeon pin is a taper fit in its boss, and is held in position by a taper-ended set screw. This in its turn is secured by a lock-nut and a long split pin.

Another common method to prevent the gudgeon pin touching the cylinder walls is to surround it with a ring, usually made of spring steel of considerable width. The Excelsior fixing is unusual, and can best be followed from the appended sketch. The Motosacoche has its gudgeon pins driven into the piston and guarded at the ends by small brass-headed caps. This method is becoming almost standard practice on lightweights. A most ingenious fixing is employed on the Scott machines, which consists of a light castellated ring screwing into the inside of the piston. The inner edge fits into grooves in the gudgeon pin. This ring is prevented from unscrewing by a pin which passes through the piston wall, which in its turn is prevented from coming out by a surrounding piston ring.

Universally-jointed Connecting Rod.

Although it scarcely comes under the heading of this article, mention must be made of the connecting rod used successfully for some years by the L.M.C. Co. The top end is made to form a universal joint, so allowing the cylinder to be removed with great ease, and compensating for any slight disalignment caused by careless bolting down of the cylinder, which occurs only too frequently at the hands of unskilled riders.

The appended sketches are not intended to be scale representations, but only serve to illustrate constructional details. UBIQUE.

SHEFFIELD AND HALLAMSHIRE M.C.C. ANNUAL WINTER RELIABILITY RUN TO BRIDLINGTON AND BACK.
The above flashlight photograph of the start from the Town Hall, Sheffield, was taken at 6.30 a.m. on Boxing Day.

ENGLISH-DUTCH RELIABILITY TRIAL.

Increasing interest in the International Trial next Summer.

ENTRIES continue to be received by *The Motor Cycle* for the above international trial, to take place in Holland on August Bank Holiday Monday, under the ægis of the Dutch Motor Cycle Club. The chief regulations appeared in our issue of December 21st, page 1388, but since then we have been asked by Mr. A. Citroen, hon. secretary of the Dutch Club, to make it quite clear that the twelve entries, *i.e.*, six amateurs and six trade representatives, will be divided equally into three classes according to the type of motor cycle ridden. The teams, therefore, will be classified as under:

	Class A. Machines up to 340 cc.	Class B. Machines from 340 to 500 c c.	Class C. Machines from 500 to 1,000 cc.
English team: Nos. E2, E4, E6, E8, E10, E12, E14, E16, E18, E20, E22, E24.	Two private owners. Two trade riders.	Two private owners. Two trade riders.	Two private owners. Two trade riders.
Dutch team: Nos. D1, D3, D5, D7, D9, D11, D13, D15, D17, D19, D21, D23.	Two private owners. Two trade riders.	Two private owners. Two trade riders.	Two private owners. Two trade riders.

Formula to determine cubical capacity, the dimensions being in centimetres:

Bore ^{2} × .7854 × stroke × No. of cylinders.

In Classes B and C machines may or may not have sidecar attachments as desired.

The Dutch M.C.C. make it clear that they desire as large a variety of machines as possible, and specially request that no one class be represented by one make of machine. Further, any one make should not appear in different powers in the three classes.

The British entries on going to press stood as follows:-

Amateur Team.	Trade Team.
W. Cooper (6½ Bradbury)	W. Pratt (3½ P. and M.)
Geoffrey Smith	J. Woodhouse (3½ Precision)
F. C Wasley	F. W. Barnes (Zenith)
L. A. Baddeley (7 Indian)	W. W. Douglas (2¾ Douglas)
Vernon Taylor (3½ Rudge)	
Seymour Smith (3½ Norton)	
Fred Dover (3½ Premier)	
A. E. Uffleman (3½ Humber)	
J. C. Bennett Mitchell (2¾ Douglas)	
Mrs. Cooke (3½ Triumph)	
C. C. Cooke (3½ Triumph)	
F. A. Hardy	
R. G. Mundy	
W. O. Oldman (5-6 Bat sc. or 4 h.p. Bat bicycle)	
C. W. Wilson (Morgan run-about)	

It will be seen that the popular 3½ h.p. class is already overfilled. In forwarding entries, the make, horse-power, and cubical capacity of the machine to be ridden should be mentioned where known. Trade entries must be accompanied by a fee of £1.

In sending his entry, Mr. F. C. Wasley (Bristol) offers to assist the party in any way if not chosen as one of the team, as the idea of an international reliability trial appeals to him as an excellent one.

Mr. and Mrs. Cooke are very anxious to go over to Holland, but special arrangements would have to be made, as the Herts County A.C. Kendal Tour is arranged for the August holidays, and Mr. Cooke is the hon. secretary of the organising club.

Mr. C. W. Wilson is the captain of the Cambridgeshire M.C.C., who accompanied the Dutch motor cyclists on their tour to the Isle of Man last year.

Mr. F. A. Hardy was one of the first to promise the Dutch motor cyclists in the Isle of Man that he would form one of the English party.

LONDON-EXETER-LONDON WINTER RUN.

W. Harry Bashall (Royal Enfield sidecar), H. E. Hull (Indian sidecar), and J. T. Bashall (Bat sidecar), approaching Shaftesbury on the return journey.

Cost of Running a Motor Cycle.

More Replies to a Reader's Query.

Sir,—Having read with much interest in *The Motor Cycle* lately various accounts of the cost of running a motor cycle, I enclose costs of running my motor cycle for five years.

I have had two machines. The first cost me £12 second-hand, and after running it four years I sold it for £8. The second, a modern magneto machine, I gave £18 for, and ran it last season, and now have an offer of £16 for it, so that I have only £6 depreciation for five years, which, however, I have not included in the cost.

You will no doubt agree with me that the average for five years' running must give a fairly accurate cost—more so than one year only.

I may say that I have done my own tuning up and any small alterations, also made my own belts, as I am connected with the leather trade.

DETAILS OF UPKEEP FOR FIVE YEARS.

Total mileage, 12,200 miles.

Licences	£6	0	0
Tyres	6	14	3
Petrol, 120 gallons	7	16	3
Oil, 10 gallons	1	14	3
Belts and fasteners	1	4	6
Ignition (mostly battery)	2	17	4
Lighting (lamps and carbide)		15	6
Repairs (including new spring fork)	6	15	0
Sundries	3	7	9
	£37	5	0

Cost .73d. per mile.

Trusting this account may interest readers,

A YORKSHIRE MAN.

Sir,—I have been prompted to write this letter by the communication appearing in your issue dated December 7th over the signature "Single Cylinder," in which the writer states that Mr. Walmsley's letter is absurd.

I have not the slightest idea who Mr. Walmsley is, but I thought the results he gave were most concise and very correct.

As regards depreciation I feel certain that any rider who buys a new machine and does 5,000 miles (that is a year's running for the ordinary motor cyclist) is lucky if he can obtain a price £10 less than he gave.

If the machine is not a new one, that is, has had a season's wear, to enable it to do 5,000 miles it will need new tyres, belt, and, most probably, several minor repairs and renewals which will, if added to the actual depreciation, amount to at least £10.

I have been a motor cyclist for the past six years, and have kept an accurate record of all expenses incurred, and, judging from them and the experiences of several other riders with whom I have talked over the matter, I am extremely doubtful if 5,000 miles can be covered in the course of a year by an ordinary motor cyclist for his pleasure at a cost of less than 1½d. per mile or £25 per year. This includes insurance, licence, keeping the machine in a good state of repair, depreciation, etc.

It would be interesting to know how "Single Cylinder" comes to his conclusion that a sidecar does not add much to running costs, as I think Mr. Walmsley's deduction of almost half as much again expense per mile, but on a much smaller mileage, is much more correct.

CECIL R. J. ROBERTS.

Sir,—The running costs of a 3½ h.p. Triumph may be of interest to your readers. All the items are actual payments, and represent a year's running of 7,007 miles, all of which was done with a Montgomery sidecar attached. The tyres include seven new ones and the belts six new ones. The machine was new in September, 1910, and cost, with sidecar, £67 5s., and has, of course, a free engine and a single gear. I have not had a single mechanical trouble, and have found the machine absolutely reliable on every occasion.

In September, after having had the mount twelve months, I took a tour to Killarney, and was surprised to find the machine come through intact after 900 miles of the worst roads I had ever been on for so long a distance during a riding life of over thirty years, including 60,000 miles on two Raleigh pedal tandems. It seems to me that your correspondents are largely guessing their costs, as the differences are so great between the various writers.

Miles travelled, 7,007.

Petrol, gallons	131	=	53.44 m.p.g.	
			Per Mile.	
Petrol cost	151.1	=	.26d.	
Belts	77.9	=	.134d.	
Tyres	270.5	=	.463d.	
Lubricating oil	11.5	=	.020d.	
Repairs	51.5	=	.088d.	
Additions	48.0	=	.081d.	
Licences and insurance	93.4	=	.160d.	
Sundries	12.5	=	.021d.	
Total	716.4	=	1.227d.	

To this I should add for depreciation £16 16s. 3d., being 25% on £67 5s., cost of complete machine. This shows:

	Per Mile.
Running costs	1.227d.
Depreciation	.576d.
Grand total	1.803d.

THOS. WADSWORTH.

Sir,—I have taken much interest in the discussion which has been going on in your paper with reference to the cost of running a 3½ h.p. motor cycle. I have had no sidecar experience, but have studied solo costs, which I append, estimated for 5,000 miles, which I consider a fair average mileage.

Depreciation per year	£6	0	0
Interest on capital, £50 at 5%	2	10	0
Tyres, one and a half per year	3	0	0
Belt, one per year	0	16	0
Petrol (48 gallons)	2	16	0
Lubricating oil and carbide	0	16	0
Replacing spares (generally plug and valve) and repairs	1	10	0
Tax, licence, and registration	1	6	0
Overhaul, £1 10s., last three years	0	10	0
Lamp, 30s., last five years	0	6	0
Total	£19	10	0

My figures work out at a fraction under one penny per mile, and are based upon the following considerations: The cost of a new motor £50. At the end of five years it should bring £20, if carefully used. This gives an average yearly depreciation of £6. If sold within five years the depreciation will be considerably higher, but a machine of good make should run for this period without causing much trouble.

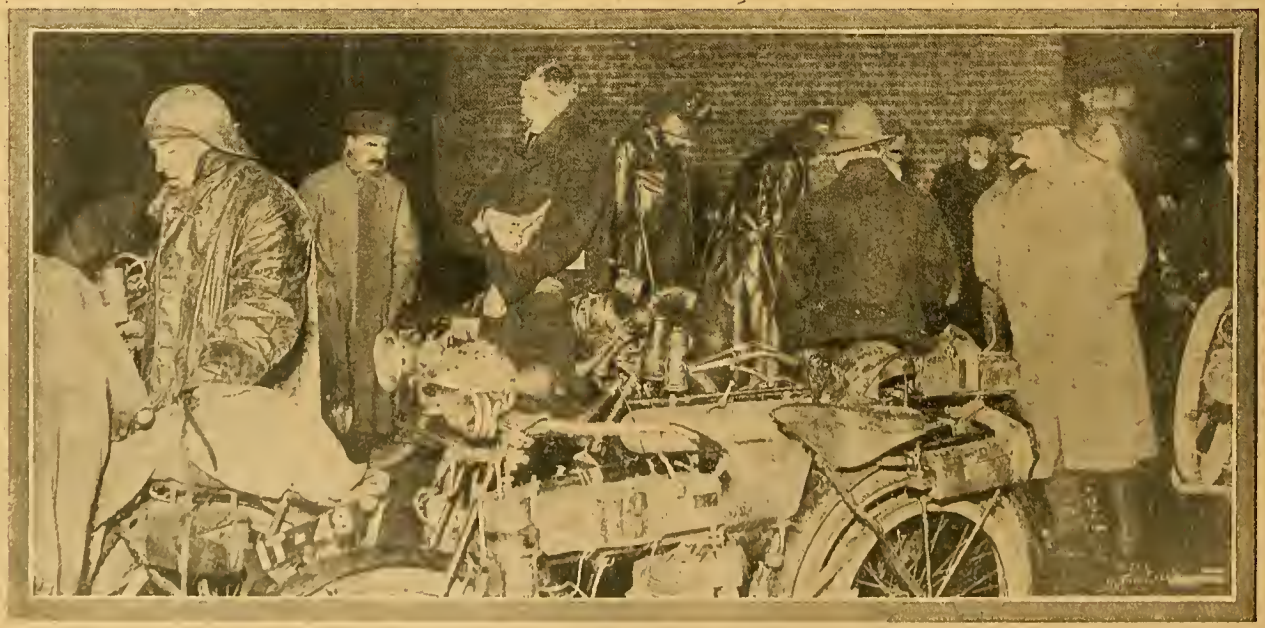
I strongly advise any intending purchaser to invest in a new machine even if he is obliged to postpone getting a machine for twelve months to raise the "ready," as it is really more economical in the end. In a second-hand machine the repair and replacements bill will as a rule more than counterbalance the higher depreciation in a new machine, and less pleasure will be derived from the pastime owing to the incessant dread of a breakdown. I do not believe in the smart gentleman who can buy a second-hand machine "good as new" at £30, and sell it for the same figure, or at a profit, at the end of a season. He will probably find that on tyres, belts, etc., he has spent a considerable sum of money of which he fails to take account, or, if not, he takes it out of some "greenhorn." We cannot, obviously, all make someone else pay for our sport, and it is, consequently, the novice who is "had"—the man for whose protection this correspondence is being published.

Some of your correspondents do not make any allowance for interest on initial outlay. In my opinion, this is quite as much entitled to be taken into consideration as cost of petrol, and the reason is obvious. I also differ from some of your correspondents in the fact that I do not allow anything for insurance, as with good brakes and a moderate speed the risk is practically nil in the case of a careful rider. Accidents should be a monopoly of the fifty miles an hour fiend.

E. DAVIS WILEY.

M.C.C. WINTER RUN TO EXETER AND BACK.

THE second annual winter run, organised by the Motor Cycling Club, was duly carried through on the 26th and 27th December, and from every point of view can be written down as a huge success. That such an event meets a long-felt want was exemplified by the wonderful measure of support, the entries numbering 119. The weather outlook on Boxing Day was depressing in the extreme, rain falling heavily throughout the London district and the whole of the West of England where the route was arranged, and it therefore says much for the pluck and enthusiasm of the entrants, under these circumstances, that exactly 100 competitors signed their names on the first checking sheet at the starting point. The official headquarters were the Bulstrode Hotel, Hounslow, immediately adjoining Heston-Hounslow station on the District Railway. Although the first man was not due out until 6.45 p.m., several had assembled as early as 2 p.m., and thence onwards the ample yard at the rear of the hotel presented an animated scene with the preparations made by competitors and their friends to ensure the machines being in perfect order.



Mudguarding Devices.

With the prospect of continuous rain and terribly muddy road surfaces, attention was naturally directed to the rigging up of better mudguarding devices than are fitted to standard machines, and many of these amateur efforts were weird and wonderful. It cannot be said that the majority were successful in keeping the riders clean, for inside the first twenty miles nearly every motor cyclist was literally smothered from head to foot, back and front, with a thick plaster of mud splashes.

Matters are slightly improving in respect to mudguarding as compared with two years ago, but we are still a long way from that wished-for period when a man can mount his machine in dirty weather with the assurance that he will dismount in a decently respectable outward condition. The condition in which many of the competitors entered hotels at the feeding places *en route* was direful, and although well-wishers of the sport might have liked to have seen them sit down in clean clothing, they can hardly be blamed for infringing against the courtesies of everyday life. To get in and out of their wads of waterproofs and oilskins—many riders were doubly protected in this way—was such a long operation that rather than waste valuable time the minority merely rinsed some of the surface dirt from hands and faces, but refrained from removing their garments from start to finish. It is a pity some of our prominent machine manufacturers were not present at Salisbury on the outward journey, as the object lessons then presented for more efficient mudguarding might have borne fruit in future designs.

An Unsuccessful Change.

The first motor cycle was due to leave Hounslow at 7 p.m., but departing from the custom of the M.C.C. when cars are also entered for the club's events, the three cars programmed were despatched ten minutes ahead of the first solo machine. This plan was doubtless intended to avoid trouble to the singles in being passed by the more stable cars, but as happened in the present case, the good intentions of the club officials were not realised. The cars kept ahead only for about twenty-five miles, and, thereafter, the motor bicycles and passenger combinations were continually passing the three cars, involving careful driving on account of the treacherous condition of the severely cambered roads between Hook and Salisbury. The car drivers steered as near as they dared to their own side when the glare of an acetylene lamp showed up from the rear, yet we witnessed several close shaves when accidents were only averted by skilful driving of both motor cycle and car. Unless there may be some good reason for the alteration, we consider it will be better for the comfort of all concerned, for the M.C.C. to revert to the plan of despatching the cars in the rear.

Final preparations for the start in the yard of the Bulstrode Hotel, Hounslow.

E. B. Ware (Chater-Lea sidecar) at Salisbury on the outward journey. (Flashlight photograph.)

Considering the somewhat out-of-the-way spot wisely chosen for the start, a fair muster of spectators had assembled, and the constables, in charge of the local superintendent of police, were easily able to keep a clear passage for the men. Half a dozen portable A.S.L. acetylene fla brilliantly lighted the road, and permitted the officials to marshal the competitors in due order. Without semblance of confusion or hurry, the 100 competitors were started by Mr. F. T. Bidlake (timekeeper) in pairs, at intervals of one minute, the last couple leaving at 7.57 p.m. Fortunately, the heavy downpour of rain had ceased two hours earlier, and except for a slight shower for a few minutes about 11 p.m. and a lighter drizzle for less than five minutes when leaving Exeter on the return journey, the weather conditions overhead could hardly have been more favourable from start to finish. Needless to remark, the soddened state of the roads made it terribly heavy work for most, and, strangely enough, the worst surfaced roads were those nearer London, as far as Sunningdale, twelve miles from the start. We should ascribe the truly awful surface from Egham to Sunningdale as due to some poor system of tar spreading, because the tar-treated surfaces from Bagshot onwards were comparatively hard.

Not a Reliability Run.

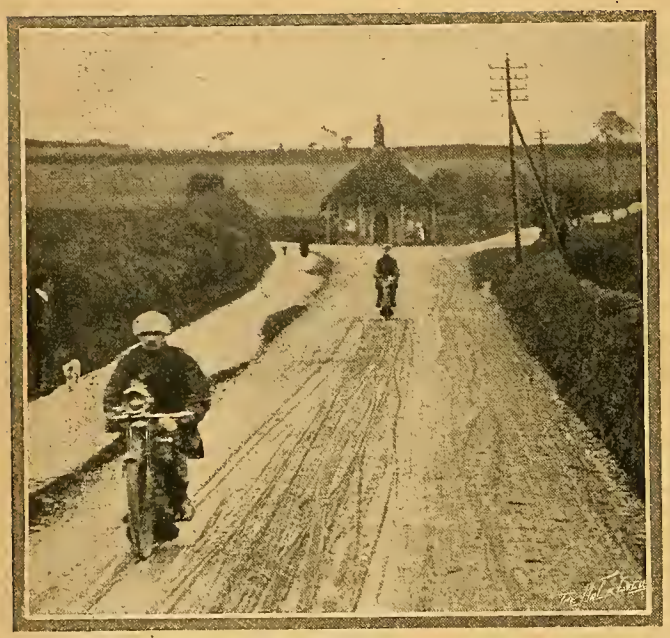
The conditions of the contest were of the "go-as-you-please" character. Inasmuch as there were no restrictions upon pace, repairs or adjustments could be effected with or without assistance by the driver on the roadside, or in garage, and in many cases the latter method of arriving home somehow was freely indulged. To describe this event as a "reliability trial" would convey a false impression, nor does the M.C.C. claim anything more for it than a "club run."

The majority of machines, of course, went through with just those minor troubles in the way of punctures, belt shortening and the like, which an ordinary tourist experiences, yet it is just as well to emphasise the fact that the good and the bad—in the way of reliable and unreliable machines—scored equally well at the finish. The only time schedule set was that the men were not permitted to leave Salisbury (outward and homeward journeys) and Exeter before fixed times, and although a check was established outside Yeovil and also at Andover on the return, we cannot learn whether too early arrival at these places will affect results. This hardly seems possible, as one of the officials who was competing arrived at Exeter some three hours before he was due to return.

The arrangements for marking the route at awkward corners and turns were admirable, large arrows fixed to boards being illuminated by shielded lanterns, so that the light fell only upon the arrow and did not throw a glare into the eyes of the approaching driver. Unfortunately, the carefully-devised scheme for this purpose was not carried through properly by the local people at two very important places. The first was at the sharp left turn from beneath the avenue of trees beyond Salisbury, at the entrance to Wilton, where one or two competitors went miles astray last year. The second place was at the uphill fork a quarter-mile west of Andover. Whether any drivers went wrong on the present occasion we could not learn, but if they did the M.C.C. officials should not be blamed, as we know they had taken special precautions concerning the two places mentioned.

In all other respects the organisation was perfect, and we must accord praise to the County Hotel at Salisbury, where the hot supper overnight and the luncheon on the return journey were meals served quickly under conditions that invited appetite to those who were tired after the long journey.

In the Salisbury Control.



Up on the high downs between Andover and Salisbury a keen north wind cut straight across the open road and discovered the weak places in clothing equipment, and the compulsory stop at the cathedral town was welcomed by everyone. The first respectable hill on the outward journey—Ludlow Hill, three miles east of Shaftesbury—brought a number of men out of the saddle, many of the drivers of low-powered sidecars having to dismount and run alongside. Having to stop at Shaftesbury for petrol (Mr. Young, the local ironmonger, kindly turning out of bed to supply our wants), the narrow main street afforded an opportunity for judging the merits of various silencers, and whilst waiting there we were able to listen to the grades of noise created by about seventy of the engines. Not more than half a dozen were quiet, as the word is understood amongst motor cyclists, a few others were less quiet, but by far the larger number were horribly and insistently noisy. One sidecar driver and the rider of a single-cylinder solo machine went through the town with exhaust cut-outs wide open, and for the sake of the sport's good name we would have noted their numbers. This unpleasant duty was rendered impossible, because numbered armlets for the drivers were omitted from this year's regulations, and as the numbers on the tanks were generally hidden by the respective driver's clothing, it was difficult to recognise anyone.

Occasionally, the noise of an approaching engine could be heard more than a quarter of a mile away, and when entering the street the reverberations thrown backwards and forwards from the houses resembled the firing of a Gatling gun. After one or two machines had passed by, it was evident many of the inhabitants were awakened from sleep, as windows were opened and heads thrust out. It is true that

A STUDY IN WINTER MOTOR CYCLING EQUIPMENT.
The competitors are H. G. Dixon (New Hudson), J. A. Neumann (Triumph), and Roy W. Walker (New Hudson).

M.C.C. Winter Run to Exeter and Back.—

Competitors approaching Chard after descending the hill.

one of the regulations of the contest stated, "Noisy driving will lead to disqualification."

Flooded Roads.

Those who competed last year were expecting trouble from flood water at Wilton. Fortunately, although the watercourse here was running bank high, the roadway was clear. However, the road which crosses the Blackmore Vale at Henstridge lived up to its reputation, two stretches, each about fifteen yards, being flooded to a depth of a few inches. Most of the drivers picked up the glint of the water early enough to avoid rushing through at high speed, and the one or two who had faulty lamps experienced little difficulty in reaching the other side.

The second outward control at Yeovil formed a delightful change from the dark country roads and poorly-lighted streets of the villages traversed from Salisbury, Moffat's depot in the main street being brilliantly lighted. The sensible men not only secured fuel for their machines, but also refreshed themselves with hot coffee at the Mermaid Hotel, for there were still forty-six miles to complete before Exeter and breakfast were reached.

Chard Hill proved a Stern Test.

The worst part of the journey was still to come, particularly for those who were not sure of the hill-climbing abilities of their mounts on strange gradients at night time. As hills go nowadays, Chard Hill is an ascent which the average motor cyclist would laugh at, if informed he would have to climb it in the course of an ordinary trip. After what we witnessed at Chard, we are beginning to wonder whether the modern motor bicycle is still a long way short of perfection, or whether the average driver does thoroughly understand his mount.

We stayed on top of the hill for about forty minutes, and certainly about threequarters of those who passed during our stop either ran beside their machines or had to be ignominiously assisted. For this latter service, a party of local good Samaritans, who had come out on a car and motor cycles from Martock to see the fun, saved many a weary rider from the hard work of pushing his machine to the summit. From the junction of roads at the top of the hill we were able to observe the long string of lamps for nearly a couple of miles before they were temporarily hidden by the turn at the foot, and it was amusing to notice the gradual decrease of engine noise as the eventual failures gradually petered out at the lower slope, to come finally to a standstill midway. When the throng was thickest, we reckoned eleven machines standing or being pushed up upon one occasion, and the shouts of "There's another!" from the small group of spectators were none too complimentary to the ears of the unfortunates. When about half the competitors had passed, three sidecar machines came to rest almost simultaneously and nearly in a straight line at the same spot on the middle of the hill.

A very few of the drivers who knew the neighbourhood considered discretion the better part of valour, and went round by an easier and nearly parallel narrower road which joins the main road at the top. Eli Clarke came up the latter way, and dismounted at the top to inform us his throttle lever had jammed and he could not obtain more than half gas.

The dreaded Yarcombe Hill, eight miles this side of Honiton, had very few victims, perhaps accounted for because its length is its worst feature, the gradient nowhere exceeding 1 in 10.

Arrival at Exeter.

Up to 8.30 a.m. exactly 91 out of the original 100 starters had checked in at Exeter, 161 miles, and with daylight in front of them all the way to Bagshot—sixteen miles from London—the chances of all these successfully surviving to the finish seemed extremely hopeful. Deacock possibly retired at Exeter, as we met him coming in when we were half-way back to Honiton.

With a dropping wind the homeward journey was covered under very much more pleasurable conditions than the outward, and as the roads were very much drier, risk of side-slip was removed. The only really formidable hill, riding towards London, is that entering Shaftesbury, and here, at the last wide turn near the top, a small crowd of motor cyclists and autocarists had assembled in the hope of many riders coming to grief. (Before reaching the foot of this hill we passed Hugh Gibson running up a short slope to relieve his sidecar machine from his weight; we were surprised to find Gibson on the route, because on arrival at Salisbury overnight he had reported trouble with the front wheel bearing, and that he intended to retire. He duly checked at Exeter, so was doubtless able to put the matter right.) The spectators at Shaftesbury were agreeably disappointed, nearly every man reaching the top without a dismount. The flood water at Henstridge had materially decreased in the intervening twelve hours, only a short patch of less than half a dozen yards having to be negotiated.

With the wind nearly astern, good speed was accomplished across the downs to Andover, but with a nasty involuntary

Nearing Shorborne. H. G. Bell (4-cyl. F.N.), E. B. Dickson (Eat), W. Coopor (Bradbury), and H. Karslake (Rover).

M.C.C. Winter Run to Exeter and Back.—

check when running down into that town. There was not a sign of loose stones here on the preceding night, but the local authorities had kindly selected the one day in winter when most motor cyclists enter the district for carefully carpeting the whole width of the road for fifty yards with sharp-edged road metal. In justice to the local surveyor we must state that a steam roller was working, but at least three-parts of the stone carpet had not been touched by the roller, with the consequence that all the drivers had to dismount and push their way across.

A similar patch of stones was met on the downward approach to Hartford Bridge, some miles nearer London, but in this case the steam roller was not given more work than could be properly accomplished in the day, the whole patch of metal being finished off smoothly.

The remainder of the journey was uneventful, save for the fearsome six miles of greasy mess, misnamed a road, from Sunningdale to Egham, over which steering was so unstable that it was wonderful how the single-trackers managed to keep upright. At the finish a big crowd of enthusiasts had come down from town to welcome their friends, and here assistance from the police was welcomed by the staff of officials in order quickly to check the arriving competitors.

We were rather interested to learn Alan Hill's experience with the dissolved acetylene gas cylinder which he carried upon his Rudge sidecar machine. He informed us that he had not suffered a moment's trouble, and that he much preferred this means of illumination in comparison with a generator, inasmuch as the pressure was absolutely constant throughout, the flame never flickered, and he was sure the light was whiter on account of the absence of any impurity.

Woodhouse reported considerable magneto trouble, W. H. Bashall was annoyed by a broken lamp bracket, A. J. Stevens had to crawl over the last six miles owing to a faulty acetylene generator, and P. W. Pumphrey burst a tyre near the finish, but managed to reach Hounslow to time.

Perfect Organisation.

There were no grumbles, which sufficiently testifies to the care and completeness with which every detail of organisation had been perfected by the honorary officials of the club. Mr. R. H. Head was chief marshal and judge, Mr. F. T. Bidlake was timekeeper, and amongst other willing helpers were Dr. C. Gibbons, Messrs. E. Gould, F. J. Jenkins, C. J. Seed, F. Albert, H. Chester-Fox, etc.

Personal Notes.

V. Olsson got water on the magneto at the floods near Sherborne, and in attempting to restart fell into a ditch with the machine on top of him.

W. Cooper secured the honour of being first back at Hounslow, as he was also first to start, thus holding his position throughout the run.

At the finish Hemy declared he would not ride back (even to Basingstoke) for £25.

The driving, generally, was a great improvement on last year. There was a good deal more give and take, and even the sidecar drivers had more consideration for the soloists.

Arrival back at Hounslow on Wednesday evening, Mr. R. H. Head (on right) checking the competitors.

All four Ariel riders, F. C. North, G. Boswell, C. B. Duberly, and S. C. Perryman, gained gold medals.

R. Croucher ran into a stray pony at Sherborne. His two-speed Kerry-Abingdon had given no trouble at all up to that point.

H. G. Bell arrived at Exeter at 5.2 a.m., which represents the earliest possible time under the rules. His average speed from Salisbury was twenty miles an hour, and his 1912 clutch model F.N. was geared 6 to 1.

The official observer for silence awarded the honours to R. O. Clark's four-cylinder F.N. and sidecar and Frank Smith's Clyno and sidecar as the two quietest machines to pass him.

List of Gold Medal Winners.

W. Cooper (3½ Bradbury)
W. H. Wells (7 Indian sc.)
J. Woodhouse (3½ Grandex-Precision)
L. A. Baddeley (7 Indian sc.)
W. A. Sale (7 Indian)
H. Karslake (3½ Rover)
W. T. W. Wartnaby (3½ W.D.)
P. H. Bentley (3½ Triumph)
R. B. Clark (2¾ Douglas)
E. B. Dickson (8 Bat)
W. H. Bashall (5-6 Enfield sc.)
J. T. Bashall (7 Bat sc.)
W. H. Egginton (6 Zenith sc.)
V. Olsson (6 Trump-Jap)
A. R. Abbott (3½ Bradbury sc.)
R. W. Walker (3½ New Hudson)
H. G. Dixon (3½ New Hudson)
W. Pratt (3½ P. and M.)
G. Wray (3½ Bradbury sc.)
H. Gibson (3½ Bradbury)
H. Foote (8 Bat)
W. F. Guiver (3½ Rudge)
B. A. Hill (3½ Rudge, sc.)
C. Q. Roberts (3½ Rover)
T. Chapman (3½ Arno)
A. Dickinson (3½ Triumph)
E. L. Mather (5-6 F.N.)
S. R. Cooke (3½ Rudge sc.)
V. Wilberforce (2¾ Douglas)
H. Patteson (3½ Triumph)
W. P. Tippett (3½ Brooklands)
J. Chater-Lea (8 Chater-Lea sc.)
R. Holloway (3½ Premier)
A. P. Maurice (3½ Premier sc.)
E. Clark (2¾ Douglas)
E. J. W. Hughes (8 Chater-Lea sc.)
H. C. Mills (3½ Premier)
N. O. Seresby (3½ Rudge)
C. B. Duberly (3½ Ariel)
G. Boswell (3½ Ariel)
J. A. Neumann (3½ Triumph)
P. W. Pumphrey (2¾ Arno)
J. Stuart-White (3½ Rex)
T. W. Tattersall (5-6 R.A.G.S.)
E. B. Ware (8 Chater-Lea sc.)
J. S. Holroyd (2½ Motosacoche)
D. S. Baddeley (3½ Phelon and Moore sc.)
P. Bounds (8 Bounds-Jap sc.)
S. C. Perryman (3½ Ariel)
R. E. Guest (6 Matchless sc.)
V. Taylor (3½ Rudge)
F. Smith (5-6 Clyno sc.)
A. J. Stevens (5 A.J.S. sc.)
C. W. Meredith (3½ Bradbury sc.)
W. C. Hemy (3½ Service)
P. W. Moffat (2¾ Douglas)
E. Kickham (2¾ Douglas)
G. N. Higgs (5-6 A.C. Sociable)
F. J. Watson (3½ Swift)
G. L. Fletcher (2¾ Douglas)
N. C. Dear (2¾ Douglas)
R. O. Clark (5-6 F.N.)
R. G. Mundy (2 Alcyon)
F. L. Goodacre (3½ A.S.L.)
S. B. White (4 Service)
R. Lord (6 Rex Sidette)
G. Griffith (3½ Rover)
J. Baker (3½ Rover)
H. S. Morgan (8 Morgan runabout)
H. A. Cooper (Bradbury)
E. G. Whelon (3½ Zenith)
E. Babington (8 Bat)
A. T. Tamplin (6 Matchless sc.)
P. G. E. James (8 Chater-Lea sc.)
H. C. Griffin (8 Bat-Bowden sc.)
F. C. North (3½ Ariel)
H. Johnson (3½ T.T. Triumph)

The following finished, but were disqualified for exceeding the time limit or finishing too soon.

H. E. Hull (7 Indian sc.)
H. G. Bell (5-6 F.N.)
C. Patteson (6 Zenith sc.)
J. Peachey (3½ Premier)
G. W. England (8 Morgan Runabout)
H. A. Thompson (8 D.R.C. sc.)

The undermentioned started, but did not finish:

W. H. Elce (6½ Rudge sc.)
J. Robertson-Brown (4¼ Ivy-Precision sc.)
C. F. Halsall (5-6 Clyno sc.)
H. R. D. Simpson (4 M.M.)
F. B. Webber (8 Morgan runabout)
R. Ellis (4¼ Calthorpe sc.)
S. Browne (3½ James sc.)
L. B. Feeny (4 Moto-Rêve sc.)
F. Thomas (7 G.O.K. sc.)
A. V. Deacock (6 N.L.G. sc.)
R. Croucher (3½ Kerry Abingdon sc.)
A. Sproston (3½ Rudge sc.)
A. Mabon (3½ Rudge sc.)
F. Begley (5 Matchless)

M.C.C. Winter Run to Exeter and Back.—

H. B. Karslake's Experiences.

A most uneventful ride! I got away from Hounslow with the W.D. just in front and all went well until we got to Salisbury, where I took a bit out of the belt. Then on to near Fovant, where a car and sidecar were having a butting competition halfway up a hill. I don't know which won, as I did not stop. After this I was sailing along merrily near Shaftesbury when Olsson's cheery voice rang out of the darkness, "Got a burner?" I had not a spare, so could not help him. At Yeovil two local motor cyclists evinced great interest in my machine, and said the belt shield "looked like a piece of Dreadnought work"; they did not know that I was the erstwhile driver thereof!

Approaching Chard I could see lights on the hill on the other side of the valley, so after passing the town I gave my Rover an extra charge of oil, and with the aid of the change-speed we roared up on half throttle, the spectators giving a cheer as we passed. Then came Yarcombe Hill with its S twist halfway up, taken on bottom gear to the tune of a machine conking out behind. On to Exeter for breakfast and daylight.

The subsequent restart had to be made, and out we rode into the rain, gloom, and black slime. Nearing Sherborne we struck a flooded road, and I nearly drowned a photographer who was trying to snap me from a car by going through the water all out. I hope he got a picture!

At Salisbury I shortened the belt again and re-inflated the back tyre, and we left for home. Nearing Andover I had my only involuntary stop caused by the belt fastener breaking. At Basingstoke we found the M.C.C. hon. sec. officiating at a secret check. At Hartley Row I lit up, and from there rode to Hounslow at a steady pace, the surface being vile and atmosphere foggy. Every man who has won a medal thoroughly deserves it.

How the Brothers Bashall fared.

It was pouring with rain when we left home about three o'clock, but as we both had oilskins which my father obtained from the Falmouth pilots we kept dry. I rode a new 5-6 h.p. Royal Enfield with a friend in the sidecar.

Unfortunately, on pushing my machine into the garage at Hounslow the silencer bit on the cobbles, and on the way to Chard the baffle tubes dropped out, so I was obliged to ride without a silencer. Half-way up Yarcombe Hill I overtook my two brothers on the 8 h.p. Bat and sidecar. They had taken the corner about 40 m.p.h. and simply tore off the back cover, tube and all. The Bat is the same sidecar that holds the hour record, and was the only single-geared twin machine with sidecar to get through. Some cheerful friend had told my brother he would want seven belts at least, but he had on the same Lyso belt he used in the hour record, and it took him through splendidly. The way we both bounded up the hills was really fine, and we reached the turning point together punctually.

On the return run it was very difficult to keep down to schedule time. The Bat and Enfield sidecars ran splendidly. It was a happy idea of the Hutchinson Tyre Co. to have a stock of waders at the start.

HARRY BASHALL.

A Lady Passenger's Impressions.

In spite of bad luck and awful weather most of the time, I would not have missed the run for a good deal. What struck me most of all was the earnestness and enthusiasm shown by the riders and their friends. There was nothing particularly noteworthy at the start—just a little excitement when some petrol on one of the cars caught fire, but the flames were soon extinguished. We started to time, my husband driving a 7 h.p. Indian with Mills-Fulford sidecar. A friend had lent us a sheep's skin sleigh-bag, and I was perfectly warm all night. The engine ran very well, and took all the hills splendidly, and all went "merry as a marriage bell" till Salisbury.

The scene in the hotel yard was very interesting to one who had never witnessed such before. One scrap of conversation amused me. It was a question of tyres, and a novel meal was being prepared for the manager of a famous tyre company. He had promised to eat a certain tyre if it punctured, and the rider of the machine to which it was fitted declared "he will jolly well have to, and it will be fun to see him do it." I do hope if it were anything like our tyre he was allowed to wash it first.

After leaving Salisbury half-way up a steep hill something suddenly went wrong, and the next moment we and all our goods and chattels were reposing on the side of the road. Happily neither of us was hurt, and my husband set to work, and in course of time—a good long time—we were ready to start again.

Later on our chain decided to leave the sprocket again, and we had to set to work in the dark to replace it. Nothing more eventful than scaring a few venturesome young rabbits happened from this time till we reached Exeter, and dawn was never welcomed more eagerly. Exeter was reached two hours late. However, we had a wash and some breakfast, and were off again as soon as possible. The run back was happily much less eventful, and we had only one or two minor troubles.

We reached Salisbury in very fair time, had a rest and dinner and off once more. As far as Basingstoke the run was most enjoyable, and here we tasted the joy of being early arrivals. From here until a good way past Bagshot everything went well, and we were quite hoping to get back in good time.

But the "best laid plans of mice and men" have to give way before a gashed tyre, and so we will draw a veil over the rest of the story. After signing in at the Bulstrode Hotel, two very wet bedraggled people did eventually arrive home and were welcomed by three small persons (who ought to have been in bed) just as joyfully as if all the honours had been showered on us.

A.M.H.

CHECKING POINTS ON THE LONDON-EXETER-LONDON 24 HOURS WINTER RUN.

(1) The scene at Salisbury. (2) At Yeovil on the return journey. The event created great interest all along the route.

BIRMINGHAM TO YORK AND BACK.

THE Birmingham Motor Cycle Club's run to York and back took place under extremely adverse conditions, the fog and greasy state of the roads rendering it a matter of some difficulty to average the schedule speed of exactly 20 m.p.h. This accounts for the fact that only six competitors finished before midnight. The route was *via* Sutton Coldfield, Tamworth, Ashby, Nottingham (check), Mansfield, Worksop, Doncaster, Ferrybridge, Tadcaster, and York, returning to Birmingham by the same route.

At York the weather was foggy and the roads and tramlines unpleasantly wet. However, Baxter (6 h.p. Rex) arrived punctually, followed by South, whose Rudge-Canoelet combination looked beautifully cosy and was much admired by local motor cyclists. These two were closely followed by Rowlandson (Rudge), Ball (Triumph), Young (Kerry), Blackwell (6 h.p. Zenith), Busby (2¾ h.p. Humber), McNab (Trump-Jap), Clarke (Corah), Duke (Zenith), Bell (New Hudson), and Pollock (James). Tom Peck (Rudge) arrived twenty-five minutes later and reported tyre trouble. Mansell (Singer), Evans (Humber), Warton and Norton (Norton) failed to put in an appearance. The last-named veteran was reported to be hung up with valve trouble fifty miles back, much to the disappointment of the local enthusiasts, as his performances at Sutton Bank in past years have made him well known throughout the North.

There appears to have been a slight hitch somewhere about the luncheon arrangements, for the competitors hurried through their meal and were ready to start in an hour, only to find that they would not be allowed to start until they had spent an hour and a half in the city.

However, a start was made at the appointed time, and all got away promptly and well, though G. Bell had to start the return journey with a leaky rear tyre.

Some of the competitors did not finish until the early hours of the morning, one reporting himself at 3.30 a.m. Never has such a severe winter trial been held in the Midlands, and the competitors generally agreed that an average of 20 m.p.h. over such difficult roads, coupled with so much riding in darkness, rendered more severe by the fog, was rather too much to expect. There were several 3½ h.p. sidecars in the trial, including G. H. Mansell's Singer, J. L. Norton's Norton, and W. D. South's Rudge.

Below we give the finishing order of the six competitors who reached Birmingham before midnight:

V. Busby (2¾ Humber)
F. A. McNab (3½ Trump-Jap)
W. Baxter (6 Rex sc.)
S. A. Rowlandson (3½ Rudge)
R. W. Duke (3½ Zenith)
W. G. Blackwell (6 Zenith)

Official Results.

The official results place the first three as follows:

1. F. A. McNab (3½ h.p. Trump-Jap), total time error 1m. 45s., gold medal.
2. V. Busby (2¾ h.p. twin Humber), total time error 4½m., silver medal.
3. E. F. Baxter (5-6 h.p. twin Rex and sidecar), total error 19m.

The above awards are made as special recognition of the competitors' performances under adverse conditions, though actually not one competitor is entitled to a gold medal, as the rules did not permit of more than one minute error at a control. McNab arrived at all controls dead on time, except Nottingham. Pollock, Peck, Clarke, Ball, and Young checked at Nottingham on the homeward journey, but did not reach the Birmingham check up to 11 p.m. P. J. Evans (Humber) retired between Doncaster and Nottingham.

AT THE YORK CONTROL IN THE BIRMINGHAM M.C.C. TWELVE HOURS' TRIAL.
(1) Signing the checking sheet outside the Windmill Hotel.
(2 and 3) Leaving the Station Hotel, York, on the homeward journey. Left to right: S. A. Rowlandson (Rudge), V. Busby (Humber), W. G. Blackwell (Zenith), A. Young (Kerry-Abingdon), G. Bell (New Hudson), T. Pollock (James), and K. Clark (Corah).

1912.

A happy and prosperous New Year to all our readers!

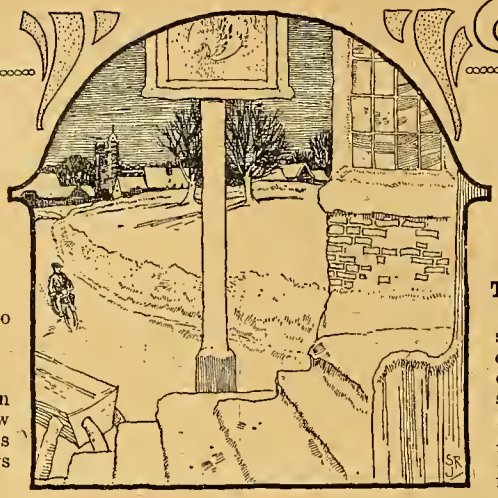
Our Record.

This is the tenth year of publication of *The Motor Cycle*. It starts the New Year in the most healthy state of its existence, for it never had more readers than at present..

English-French Trial.

An English-French trial is suggested for the Easter holidays. W. Cooper is corresponding with a member of the Auto Cycle Club de France on the matter.

Two New Competitions.



The Birmingham M.C.C. is to hold an open reliability trial to Perth and back at Easter, starting on Easter Saturday, resting on Sunday, and returning Easter Monday. A hill-climb will be held at Shap Fell on the outward journey. Another innovation is an open competition on May 18th, for passenger machines only, the maximum cost of which will probably be limited to £120 or less. It certainly should be much less in our opinion.

The Auto Cycle Club de France.

The above French organisation has decided on the following dates for its 1912 events, briefly referred to in our last issue. The mile and kilometre speed trials with flying starts will take place in March, the 300 kilometres (185 miles) race over a closed circuit the second week in April, and the Tour de France reliability trial will occupy the last two weeks of August. In all the above will be arranged classes as follows: Motor bicycles—Class I., under 225 c.c.; Class II., under 350 c.c.; Class III., under 500 c.c. Passenger motor cycles—Class I., single cyliuders under 500 c.c.; Class II., two cylinders under 750 c.c. Quadcars and runabouts—Class I., single cylinders under 750 c.c.; Class II., two cylinders under 1,000 c.c.; Class III., four cylinders under 1,250 c.c. Motor bicycles must weigh not less than 40 kilogrammes (88 lbs.), and in the passenger classes the combined weight of passengers carried must not be less than 150 kilogrammes (23½ stones).

The Tour de France.

The route comprised by the Tour de France passes through the following towns, with Paris as the starting and finishing point. Starting northwards, the principal places passed are Lille, Boulogne, Dieppe, Havre, Rouen, Trouville, St. Malo, Nantes, Bordeaux, Clermont-Ferrand, St. Etienne, Lyons, Mâcon, and Dijon. The total distance is about 1,860 miles.

Invitation Trial in Yorkshire.

The Ilkley M.C.C. is in communication with a number of Yorkshire clubs regarding an invitation reliability trial on January 20th and 21st. It is proposed to start at 5 p.m. from Ilkley, and journey *via* Skipton, Buckham Brow, Kendal, over Shap Fells, to Penrith, then *via* Hartside to Alston, the highest market town in Yorkshire, where the night will be spent. The homeward run is through Middleton-in-Teesdale, Barnard Castle, Brough, Kirkby Stephen, Hawes, up Kidstones Pass, and back to Ilkley. Should sufficient guarantees be received (twenty are required), the trial will be held. If the weather should be severe, competitors are in for a very rough time as the course chosen is severe at the best of times.

SPECIAL FEATURES.

EXAMPLES OF MODERN PISTON DESIGN.

WINTER RELIABILITY RUNS IN ALL DISTRICTS (Described and Illustrated).

The French Winter Hill-climb.

There seems to be some misunderstanding as to who won the unlimited class in the above hill-climb, which is easily explained when we mention that seven different journals gave A. J. Moorhouse (Indian) as the winner. *The Motor Cycle* report, crediting W. H. Bashall (Matchless) with fastest time in the unlimited class, viz., 28s., was quite correct, Moorhouse making second fastest time of the day in this class, and winning the amateur event.

Open Reliability Trial.

The first of a series of four 100 miles open reliability and sporting trials, organised by the Herts County A.C., will be held on Saturday, January 20th, starting from the Chequers Hotel, Uxbridge, at 10 a.m. The route is: Uxbridge, Denham Avenue, Rickmansworth, Watford, St. Albans, Harpenden, Luton, Sharpenhoe, Dunstable, Ivinghoe, Tring, Aston Clinton, Wendover, Princes Risborough, Missenden, Amersham, Rickmansworth, and Uxbridge. Competitors failing to negotiate certain observed hills and corners *en route* will be penalised one mark per stop.

LONDON-EXETER-LONDON 24 HOURS' RUN.

Group of competitors at the Yeovil control.

The Season's Greetings.

We desire to return thanks to those readers who kindly sent Christmas and New Year cards to the editor and staff. Quite a large number reached us from appreciative readers.

English-Dutch Reliability Trial.

On going to press, the entry of W. F. Newsome (3½ h.p. Triumph) reaches us for the British trade team in the above contest. British entrants now total twenty. See page 4.

The New Brough Runabout.

The Brough runabout, described in our last issue, and which was entered for the London-Exeter run, was not completed until Christmas Day, so that it was deemed advisable not to start in the trial. In future all the sociable type vehicles will have a three-speed gear and silent chain drive.

A 6 h.p. Lady's Mount.

Miss Muriel Hind writes us to the effect that she has decided to order one of the new 6 h.p. Rex twins with side by side valves for 1912. It is to have a special frame built for her which will be very low. Miss Hind tells us that she will keep her old 5 h.p. (The Blue Devil) for ordinary use, the new mount being intended for hill-climbing competitions only.

M.C.C. Annual General Meeting.

The annual general meeting of the Motor Cycling Club will be held at the Inns of Court Hotel, Lincoln's Inn Fields, W.C., on Wednesday, the 10th inst., at 6.30 p.m. The receipts and payments account for the year ended November 30th, 1911, shows the following items: Receipts, competition fees, £389 4s.; receipts, current subscriptions, £328 14s. The chief payments are for medals and prizes, £310 2s. 3d.; competition expenses, £212 4s. 2d. The cash at bank amounts to £232 17s. 11d.

F. A. McNab (3½ h.p. Trump-Jap), winner of the Birmingham Club's Open Twelve Hours' Trial, which proved a most severe test owing to bad roads and fog. Snapped at York. (See page 11.)

FUTURE EVENTS

Jan. 20.—Herts. County M.C.C Open Trial.
" 20.—A.C.U. Annual Dinner.
Mar. 2.—Auto Cycle Union Open One Day Trial.
" 23.—B.M.C.R.C. Race Meeting.
" 30.—Derby and District M.C.C. Open Hill-climb.
Apl. 5-8.—N.W. London and Herts. County M.C.C. Joint Trial and Open Hill-climb (Yorks.) and Ladies' Competition.
" 8.—Westmorland M.C.C. Open Hill-climb at Shap Fell.
" 13.—Oxford M.C.C. Open Hill-climb

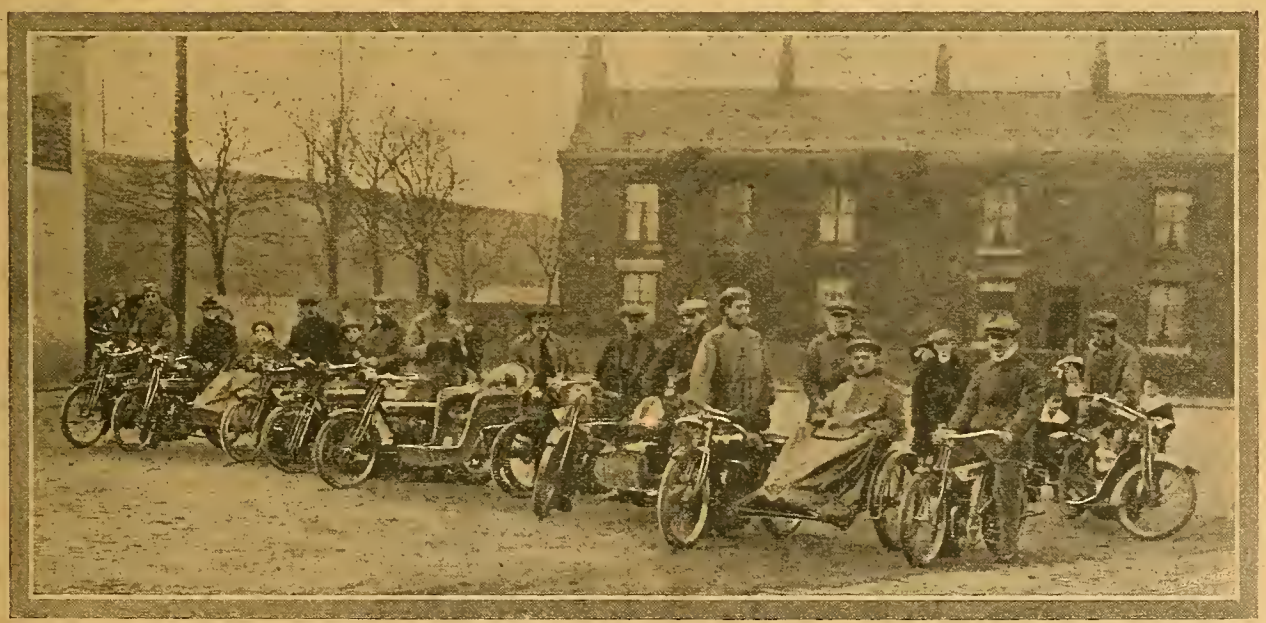
Another Passenger Trial.

Mr. C. C. Cooke tells us that the Herts County A.C. motor cycle and car sections are combining forces to hold a big open event for all types of passenger machines this year.

A Comprehensive Issue.

This issue contains exclusive descriptions, with illustrations, of all the winter reliability trials, North, South, East, and West, including several important trials not dealt with in any other journal.

Stealing.



The Bicycling World and Motor Cycle Review (America) published on the 9th and 16th ults. four whole pages of sketches lifted bodily from this journal. In some instances the illustrations bear our artist's initials, but not the slightest acknowledgment is made. We can only say that it must be a welcome change for the readers of the American paper referred to, to see a selection of really first-class practical sketches in a native journal, and doubtless the Yankee editor recognises this fact.

C. R. Collier may go to America.

We understand that C. R. Collier is very likely going to Los Angeles, California, to race against Jake de Rosier in a series of matches. We questioned Mr. Collier, sen., about this report on Monday last, but he was unable to state definitely that his son would go. Probably the truth of the matter is that Collier is anxious enough to go, but before starting he is desirous of making sure that the financial arrangements on the side of the challengers are satisfactory.

The Number of Motor Cycles in France.

From recent returns, the number of motor cycles in use in France is 27,057 (twenty-seven thousand and fifty-seven). These figures, in addition to being small in comparison with our own, are meagre for a country the size of France. If the pastime were anything like as popular as it is in Great Britain the number should be at least six times twenty-seven thousand. There is, however, every probability of this number being largely increased in the near future.

STOCKPORT M.C.C. NON-STOP RELIABILITY TRIAL.
Scene at the start—Hazel Grove—of the fifty miles non-stop run held recently over a hilly course in Derbyshire by the Stockport M.C.C. F. Sixsmith (Scott) won the prize for solo machines, while the sidecar prize was tied for by D. Thomas (7 h.p. twin J.A.P.) and J. Norman (5 h.p. twin Rex).

Carlyle (Chelsea) C.C. (Motor Cycle Section).

The annual fancy dress ball will be held at Fulham Town Hall on the 18th inst.

Finsbury Park C.C.

The annual general meeting will take place at headquarters on the 10th inst. at 7.30 p.m. Suggestions for the 1912 season will be welcomed.

Wath and District M.C.C.

A meeting inaugurating this club was held at the Red Lion Hotel, Wath, on the 28th ult. Mr. W. W. Evers was elected secretary. The next meeting will take place on Thursday, the 11th inst.

Newcastle and District M.C.

The members held a supper at the clubhouse, 3, Saville Place, Newcastle-on-Tyne, on Thursday evening, and advantage was taken of the occasion to make a presentation to Mr. Ernest Hawkins, who is retiring from the position of hon. sec. Mr. Crosier afterwards read an interesting paper upon the recent Olympia Show. Dealing with the advances made in the construction of motor cycles during the past year, he referred particularly to the improvement made in change-speed gears.

Preston and District M.C.C.

The annual meeting of the Lancashire Motor Cycle Club was held at the Bull and Royal Hotel on Thursday, December 21st. There was a good attendance. After some discussion it was resolved to alter the name of the club to the Preston and District Motor Cycle Club, and to restrict the membership to persons residing within a twelve-mile radius. The subscription was reduced to 5s. by way of experiment and with a view to increasing the membership. The annual dinner will be held at the headquarters on Thursday, January 25th, and will be followed by a cinematograph exhibition and smoking concert.

Dublin and District M.C.C.

The winter trial, which it had been intended to run to Waterford and back, was altered to a century run in Co. Wicklow. The weather was bad and the roads truly awful; six only of the fourteen entrants started, viz., W. P. Kennedy (5-6 F.N.), C. B. Franklin (7 Indian), P. Dunkley (3½ Triumph), J. Healy (3½ Rudge), P. J. Brady (3½ Rudge), and R. Walshe (3½ Rudge). The course was *via* Wicklow, Ashford, Ballymacrae Hill, Glendalough, Aughrim, Rathdrum, and back to Dublin. Franklin and Dunkley were the only men to make clean ascents of Ballymacrae Hill, and the first-named and Healy were the only ones to complete the 100 miles without loss of marks. The first award, a gold medal, goes to Franklin. To-night the members will meet at the Dolphin Hotel for an informal dinner at which a presentation will be made to the hon. sec., Mr. F. J. Walker.

Blackpool and Fylde M.C.C.

The double non-stop run to Kendal was a great success in spite of bad weather and roads. Result: 1. R. G. Parker (2¾ Douglas); 2, T. M. Jones (5 Indian); 3, J. Howarth (6 Chater Lea and sidecar); 4, T. Bale (8 Matchless and sidecar); 5, S. O. Taylor (3½ Bradbury); 6, G. F. White (3½ Bradbury); 7, T Wildman (2¾ Enfield). All these made non-stop runs both ways. The following stopped one way only: F. Naylor (5 Indian), J. R. Crossley (6 Rex Jap), A. V. Catterall (3½ Triumph), R. W. Robinson (3½ Bradbury and sidecar), C. C. Humber (2¾ Douglas), W. J. Hazleton (3½ Bradbury and sidecar), and A. Bond (3½ G.B.). Also ran: T. B. Sharples (7 Jap and sidecar), H. Bailey (3½ Triumph), C. Careless (7 Indian and sidecar), and W. T. Chadwick (8 Matchless and sidecar). The route was *vid* Poulton, Garstang, Lancaster, and Milnthorpe. Mr. Bennet, of the Bosch Magneto Co., will lecture at the Victoria Café on the 8th inst., at 8 o'clock. All motor cyclists are invited. A reliability trial will take place on the 27th inst. *vid* Caton, Settle, Clitheroe, and Preston, distance 120 miles.

B14

Bristol M.C.C.

Mr. Henri Meyer will give a lantern lecture on Tuesday next entitled, "Motor Cycling in Alpine Regions from the Mechanical and Tourist Point of View."

Birmingham M.C.C.

At last the long drawn out autumn reliability trials have been brought to a conclusion. R. W. Duke (3½ h.p. Zenith) is the ultimate winner, R. H. Edwards (3½ h.p. Triumph) retiring.

Sutton Coldfield A.C.

The club has made application to the A.C.U. for a permit to hold an open reliability trial on the third Saturday in February. The trial is for the Colmore cup and gold medal, and will be under rules similar to last year's event.

Coventry and Warwickshire M.C.

The Yuletide run last Saturday proved a big success, nearly sixty members and friends on motor cycles and cars taking part. Forty-five sat down to dinner at the Dun Cow Hotel, Dunchurch, after which an excellent musical programme was gone through, the members arriving home about 9 p.m. after a memorable run through the foggy night.

The eighth annual dinner and prize distribution is to take place on Friday, February 2nd, at the Masonic Hall, Coventry. Tickets, 5s. each, may be obtained of the hon. secretary, Mr. G. Smith, 19, Hertford Street, Coventry.

Sheffield and Hallamshire M.C.C.

The above club held its second annual winter run on Boxing Day, Tuesday, December 26th. On the outward journey Stacey (Quadrant) was soon in trouble with a broken belt, as was also Raynes (A.J.S.) with a broken chain. Through Askern, Bellamy (Zenith) and Flint (Norton) got off the route, and were, consequently, late at the next control.

On the homeward journey Raynes (A.J.S.) was held up for an hour on the Wolds with a badly cut tyre. As the leaders neared home, however, the rain commenced, and then the weak points of machines became apparent. There was general complaint of magneto troubles, owing to insufficient protection from the mud. Apparently, those using leather belts were free from belt slip in the rain. Bradbury (Norton and sidecar) broke his leather belt twenty miles from home, the delay causing his only loss of marks.

However, all the competitors arrived home approximately to time except Vale (Griffon), who suffered a multitude of troubles, and Raynes (A.J.S.), who stayed behind to help him.

Stacey (Quadrant) was an hour late, and reported continuous belt trouble. The results, subject to confirmation, are:

SIDECAR CLASS.

	Rider and machine.	Marks lost.
1.	A. T. Smith (6 h.p. Zenith)	1
2.	F Roper (5 h.p. Indian)	6
3.	D. Bradbury (3½ h.p. Norton)	9

Silver medals for finishing within thirty minutes of schedule time: R. Blackbourne (6 h.p. Zenith and sidecar) and H. Short (8 Chater-Lea and sidecar).

SOLO CLASS.

In this class two riders lost no marks. With this contingency in view a secret check had been taken. Results:

	Rider and machine.	Marks lost.
1.	E. Cross (3½ h.p. Triumph)	0
2.	H. V. Swift (2¾ h.p. Douglas)	0
	(but had greater error at secret check)	
3.	C. Bellamy (3½ h.p. Zenith)	11½

Qualified for silver medals: N. Newton and T. Durant.

The following also competed:

J. Haslam (2¾ Douglas)
F. Fulford (2½ Levis)
R. Flint (3½ Norton)
S. Raynes (2½ A.J.S.)
J. Vale (2¾ Griffon)
J. A. Stacey (4½ Quadrant sc.)
H. Lambert (6 Zenith sc.)

Note to Club Secretaries.

We are asked to state that Mr. A. E. Bennett, of the Bosch Magneto Co., has one or two vacant dates for lectures during the next month.

By W. Jawcett

TO THE TYROL AND BACK ON MOTOR CYCLES

THE perusal of "The High Roads of the Alps," by C. L. Freeston, F.R.G.S., and also my keenness to go to Austria and see the Stelvio Pass, gave me the idea that my next holiday must be on my motor bicycle. Something over two thousand miles must be covered, and the vexed question of whether I should buy a two-speeder troubled me for some time, but in the end I bought a 3½ h.p. touring model Matchless, single speed.

My next worry was, could I get someone to join me? and after two disappointments, I was successful in inducing W. E. Grange, who had ridden through the 1911 Junior T.T., to go, and with his 3½ h.p. Bradbury cut down to 499 c.c. he decided practically to alter nothing but go with it as it was, with long exhaust pipe and all.

Our Machines Described.

Perhaps I had better give here some particulars of the machines. Grange kept his capacity at 499 c.c., retained his studded Dunlops, carried a spare outer cover and sundry tubes, a Lyso 1in. belt and spares, and had semi-T.T. handle-bars, two sets of footrests, B. and B. carburetter. His method of carrying luggage was as novel as it was satisfactory, consisting of a wicker pillion passenger seat on the carrier, with three leather and canvas bags with plenty of spares and clothing, and a tremendous strap to keep them in position. My machine was the ordinary standard 3½ h.p. 1911 Matchless with pedalling gear, B and B. carburetter, ⅞in. Lyso belt and two spares, 2¼in. Palmer cord studded tyres and no spares, and one extra inner tube; whilst I had a box made for the carrier to hold the belts, tube, spares, a quart of Price's "A," camera, and odds and ends. At the side I had strapped a small suit case, resting on a small platform and covered with waterproof cloth, holding a spare pair of trousers, socks, shaving tackle, brushes, and underclothing, etc. Neither of us carried lamps, as we did not think it necessary.

We were already members of the C.T.C., and obtained customs permits for France, Italy, and Switzerland free, but for Austria there were special tickets, for which duty amounting to £3 10s. each had to be paid, to be returned on producing our papers duly cancelled. The C.T.C. Continental Handbook, from which could be ascertained the size of any town, also the hotels, charges, etc., was also taken, together with a map of France and part of the adjoining countries, the scale being sixteen miles to the inch, also Brunn's map of the Tyrol.

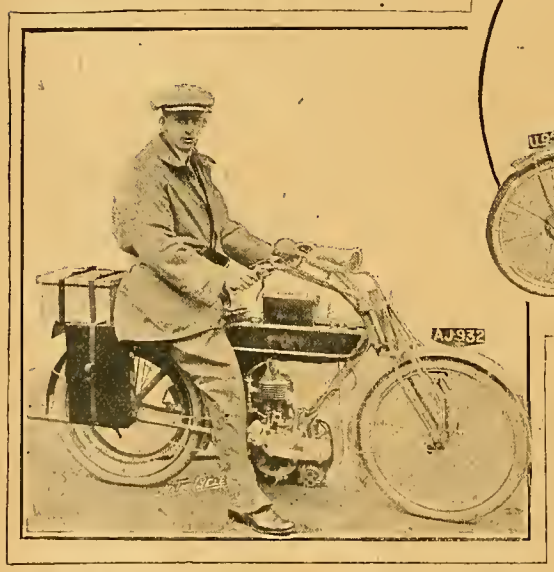
Monday, July 10th, about seven o'clock, Grange called and told me he had packed everything whilst the machine was on the stand, and on pushing it off preparatory to starting he had such a weight on that the whole affair pulled him over and fell with a crash on the ground, breaking his stand. This was quite a warning to him, and the question was, how were we to start? I live in the middle of a long hill, and we thought it too much to attempt to start in the middle, so we went to the bottom. The weather was warm and fine, and we made straight for Wetherby, about nine miles distant. The weight on the Bradbury was awful, and Grange said the steering was queer, especially at corners, whilst I could hardly say I was at home. Every pot hole seemed as if it would smash the carrier to bits.

Easy Journey to the South Coast.

The Great North Road possessed but little interest to us, Newark being our stopping-place for food. Grange also took the opportunity here to send a telegram to Messrs. Bradbury for a new stand, and also a new cam wheel. It seems that the day before he had been screwing the nut on the spindle, and he had

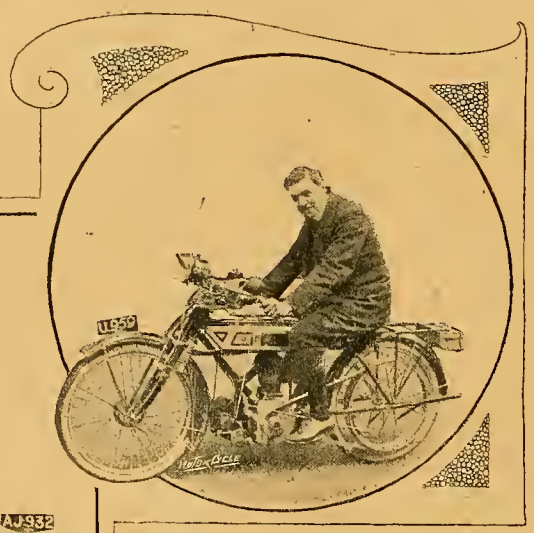
The C.T.C. customs ticket, which successfully passed the tourists through France, Italy, and Switzerland.

given it such a wrench that he had pulled the nut end off, and had only just hammered the end over. The wonder is that the wheel, which, by the by, drives the magneto, had stuck on at all. This done, we set off, and arrived without incident at Edmonton, just on the outskirts of London, having covered what was eventually to prove our biggest day's distance, viz., 212 miles.



Next morning, Tuesday, I visited the works of Messrs. Prestwich, and they very kindly ground in my valves and cleaned the cylinder and piston. I may say that I had done nothing in the way of preparing my engine, as we went off almost immediately after our return home from seeing the T.T. races.

To the Tyrol and Back on Motor Cycles.—



In the afternoon we crossed the Thames by ferry, and had a good run *viâ* Maidstone, over tarred roads nearly the whole of the way to Folkestone, the day's distance being eighty-one miles.

Wednesday was another sunny day, and after wheeling our bicycles to the landing stage we went to book our passage to Boulogne, the fare being 7s. 5d. each and 10s. each machine, single journey. This I consider out of all reason for such a short journey, about 1¾ hours, and it is no wonder that so many people try to swim the Channel! However, I decided not to come back the same way, even if I had to return *viâ* Russia.

Boulogne was reached about 2.45, and we went straight to the Customs House to present our C.T.C. tickets, here the officer made out a permit for 6d. each, the whole proceeding only occupying a few minutes, and we were then free to roam wherever we wished. Getting petrol was our next difficulty. There were some cases of it on the dock side, but the owner could not be found, so, enlisting the services of one of the usual crowd, we sent him to the town for two cans. Whilst waiting, we made enquiries at the offices of the Bennett Line, and got particulars of sailings from Boulogne to Hull and Goole. Eventually the petrol turned up, with the usual tale of how hard it had been to procure, and, our tanks being empty, we were able to take a tin each. Perhaps I had better mention that, as a rule, petrol is sold abroad in 5 litre tins. This cost five francs for the two, and works out at about 2s. a gallon.

W. N. Fawcett, the writer of the accompanying article, astride his 3½ h.p. Matchless-Jap.

W. E. Grange (3½ h.p. Bradbury), who accompanied Mr. Fawcett on the tour.

Off from Boulogne.

At last we set off, and in Boulogne itself turned to the right and struck an atrocious road, a bad example of bumpy sets or *pavé*, which unpleasantly reminded us again of our weight behind. At last we struck a better road, and as we had received a good shaking up, called a halt. Knowing that petrol was going to be rather an expensive item, we brought out our cases of spare B. and B. jets, but I found that I had my smallest jet already in, so I hammered it still smaller. Continuing, we passed through Samer and reached Montreuil, where we turned to the left and again struck an awful road—it was more of a nightmare; we could see for miles straight ahead, no hedges, no corners, but tall trees, similar to poplars, bordered each side of the road, which was itself composed of large rounded sets with several missing; sometimes there was a track on the side about a foot wide, but it was unpleasantly near the trees and often intersected by a deep gulley. We scarcely ever did more than twelve miles an hour, and eventually arrived, after passing Hesdin and St. Pol, at Arras, where we decided to spend the night at the Hotel de l'Univers, which we found excellent. During the day Grange had broken part of the spring on his front forks, but by tightening the screws up he had made them semi-rigid. I thought something must happen, as he was careering through some villages at fifteen miles an hour, when I was nearly shaken to bits at about half the speed. The afternoon's distance was seventy-one miles.

Next morning we had the customary rolls and coffee, and after receiving the bill I produced my C.T.C. badge and asked, much to our host's surprise, for the ten per cent. discount to which the handbook showed us we were entitled at this hotel. It was knocked off without demur.

Great Heat and Slow Going.

Another glorious day, and we set off in high spirits after we had filled up with petrol, and Grange had bought a glass to replace one he had broken in his goggles. Whilst we were waiting a funeral passed. First came several choir boys with a cross and chanting a psalm, and then some little boys and girls with bouquets, after which came the coffin and the elder relations and friends. We turned into a side street and tried to get in front of the procession, when Grange came a cropper in trying to avoid a cart coming out of a narrow side street. After a few words on both sides we eventually got into the main street again and reached the country. A perfectly straight road was next followed through Cambrai, where, by the by, our luggage was examined for dutiable articles just as we entered the town. Here we turned to the right, and later on to the left, and reached St. Quintin. The villages we had been passing through were far from beautiful to look upon, most of the cottages being dirty and colour washed, whilst the farm yards

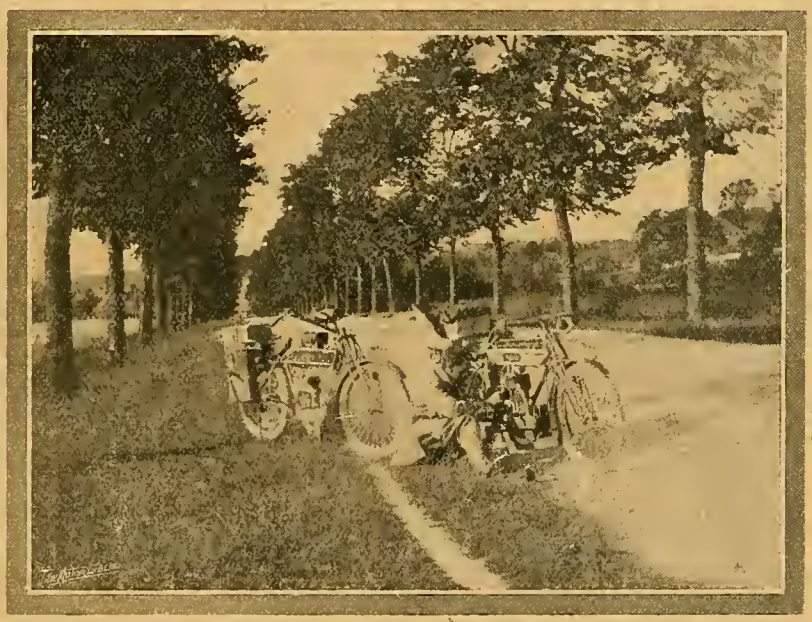
To the Tyrol and Back on Motor Cycles.—

opened straight on to the vile cobble street. The weather was awfully hot, and what made it more exasperating was the fact that the roads were so bad that a speed of twenty miles an hour could not be maintained to give us a chance to keep cool. I had not gone far when I found the top of my oil pump had screwed out, which necessitated a stop. The least exertion caused me to perspire, so hot was it—in fact, how the engines stood it I don't know.

On we went. As a rule, the road was perfectly straight, but more than thirty miles of it per cyclometer was wretched *pavé*. Oh, how we hated the sight of it! Laon was eventually reached, then, thirty miles further on, Rheims, and as we had now done 110 miles in sweltering heat over atrocious roads, we decided to stay the night here at the Hotel du Commerce et Metropole, and found it good. Our usual method in regard to hotels was to have breakfast about eight o'clock, and then ride slowly all day, with sundry stops for a smoke or to eat fruit, never deciding till late in the afternoon where to stay the night. This we found best, as we never knew what the roads had in store for us. We usually arrived at the hotel in time for a good wash before sitting down to seven o'clock dinner, and we were always lucky in getting a good meal.

Rheims was partly explored in the evening, and seemed full of people; in fact, some of the streets were blocked, doubtless owing to some kind of celebrations that were being held.

Our machines were greased on the plated parts, and the dust was thick all over, but no matter how dirty or dusty we appeared, the hotel proprietors were always pleased to see us—a pleasing contrast to the treatment sometimes experienced when entering a decent hotel at home.



Next morning, Friday, July 14th, we donned our overalls again, and, leaving Rheims, made for Châlons-sur-Marne, luckily over better roads, although somewhat loose, owing to the hot weather.

Tyre and Carrier Troubles.

At Châlons we stopped and bought a pound and a half of peaches for 9d., which we ate in a shady spot and finished up with a cool smoke. Soon after this I pulled two nails out of my back cover, but a careful search failed to reveal any puncture in the tube, so it was replaced. We were now approaching Troyes, and decided to put up there, but I was destined to have one or two stoppages first, for three times I blew up the rear tyre, and once, when going through a village, I heard such an awful grating sound from behind that I had to pull up in very quick time, to discover that my carrier and luggage had slid back and were trailing on the road. The carrier had slotted fastenings, so that the whole lot could be swung backwards to facilitate tyre repairs; these ends were temporarily hammered up, and we reached the Hotel St. Laurent in good time. Here I took out the back tube, and found a small puncture on the rim side of the tube: at the same time Grange produced a hefty hammer from his kit, and we hammered up the slotted ends on my carrier, and they never gave any further trouble. Although we only covered eighty miles that day it had taken us about six hours owing to frequent halts.

Again the weather was glorious as we set off for Bar (not the mahogany variety!), and the country now appeared to be improving from a scenic standpoint, but it still left something to be desired. As we were leaving Troyes, we were pleased to see a Bedelia.

The day was not quite so hot, but the dust was much more troublesome. Through Chatillon we followed a stream for a long way, and on looking at the map I was surprised to see we were on the banks of the Seine, and only a very short distance from its source; in fact, so narrow was it here, we could almost jump across. Dijon was our next stopping-place for the night. As we approached it the scenery greatly improved, and when it appeared as if we were in for a nice stiff climb, we stopped on a long descent for Grange to put his gear ratio down and cut his belt; but I decided not to touch mine, as it was giving a gear of 4⅓ to 1. We had not gone far when I had to open my throttle a bit more, and then more, the road developing into a nice twisty and sporting hill, but careful "nursing" at corners enabled me to get up comfortably. Once at the top I waited for Grange, and as he did not appear, I returned and met him coming up; he told me later that lowering the gear and cutting the belt had proved his undoing, for he broke a fastener.

Fitting smaller jets just outside Boulogne, in order to cut down the expense of petrol.

We had now done ninety-seven miles to Dijon, and put up at the C.T.C. Hotel Moderne et du Jura; and it was modern, for there, actually on the mat, was the word "Welcome." It proved the best hotel we had found so far, and the bedroom was a marvel, with its hot and cold water and shaving mirror, also, amongst other things, a dummy clock worked by electricity from the hall.

(To be continued.)

Brooklands and the Six Days' Trial.

So simple! And we never thought of it before! For years past we have been racking our wits for some simple precaution which should avoid the annual rumours whispered in select circles at the termination of every 1,000 miles trial.

It is common knowledge that two or three machines at least scrape through every event of the kind by the skin of their teeth. I remember a certain machine falling in half only five miles after finishing an important trial, though its success was advertised with sickening regularity for years afterwards, and for aught I know adorns the pages of a lavish catalogue to-day.

Only last summer I heard of a gold-medalled engine dismantled at the factory three days after the Harrogate trials; its bearings were oval, even to the naked eye, and the knock when it was run slowly reminded one of the village blacksmith's heaviest sledge landing on the anvil. The teeth of its timing gears were half stripped, and the fragments had leaked through into the crank case; the two-speed gear was a mass of rectangular "balls" and ground ball races; in fact, the machine must have collapsed within another 100 miles.

Some of the facts come to the knowledge of competitors and spectators, partly owing to the frank conversation or gingerly driving of the irate owner; others are astutely concealed by crafty riders; but few of them ever become public property.

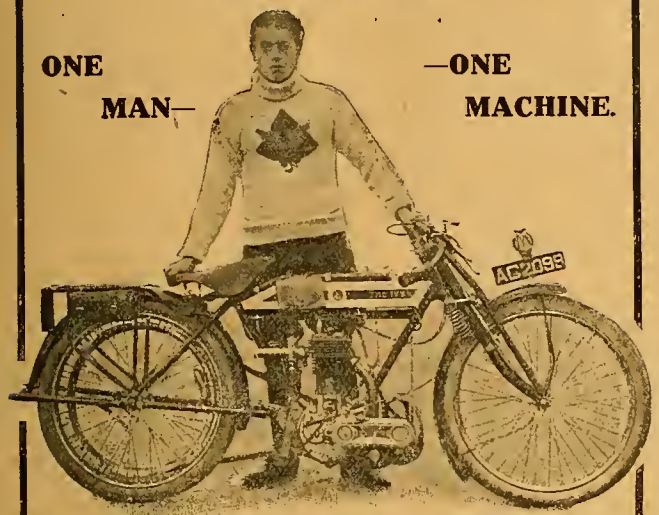
I must admit that a concluding high speed test on Brooklands, succeeded by a searching scrutiny of the machine hot from the track, will not eliminate every possibility. The machine that could not cover another ten miles may still occasionally carry off a high award. But it must be granted that a prolonged high speed reliability run on Brooklands is the test *par excellence* best calculated to bring incipient or latent troubles to a head. It will resemble giving a fever patient an ice bath, for only the very hardiest will survive it, and the A.C.U. should surely adopt the solution *nem. con.*

Spring Deliveries.

Thousands of motor cyclists are evidently somewhat helpless individuals, and my postbag shows that I must mention a matter which ought to be self explanatory. As most of us know, the really popular firms have already disposed of their entire output for months ahead, while two or three factories, it is said, can deliver no fresh orders until Easter, 1913, and one firm at least was reported to be booked up to Christmas, 1912, as early as the opening day of the Olympia Show. My correspondence shows that some innocent readers imagine that all these machines are separately and singly ordered by private individuals residing at the "Hollies" or the "Myrtles" or similar suburban addresses, and so I get letters like the following: "Dear Ixion,—I had set my heart on riding a 3½ h.p. two-speeder Geewhizz, but on writing the makers I find that they have disposed of their entire output up to December, 1912. My motor cycle friends inform me that Messieurs (here follows a list of the twenty leading firms in the industry) have also disposed of their output for six months ahead. In my sad trouble can you very kindly inform me which firms can supply machines in reasonable time? I want a machine for (here follow the weights of the writer's best girl, second best girl, rich aunt, etc., etc., with detailed descriptions of the terrible hills abounding in his suburb, the hairpin corner just outside his future father-in-law's villa, and many other details of too purely domestic an interest for quotation here)."

The most casual glance at *The Motor Cycle* advertisement columns should surely inform the most hidebound ignoramus that only a small percentage of these imposing order lists are filled with the names of potential *users*. The great majority of these machines are sold to distributing agencies, which take delivery of one, five, or twenty samples of the best known makes each week from January to December, and at nearly every period of the year except a short period around Easter, almost immmediate delivery of any well-known make is obtainable from one or other of these local agencies.

Therefore because the makers' order books are full there should be no difficulty in purchasing just what the reader wants by applying to the nearest agent, who can usually give reasonable delivery.



NOISY EXHAUSTS.—
GEORGE NEWBURN'S HIGHLY SUCCESSFUL SOLUTION.

The unanimous opinion of eye and ear witnesses is that the well-known comedian's suggestion has solved the difficulty. The engine explosions cannot be heard even when driving on full throttle and with the cut-out wide open. The apparatus in the sidecar used for the experiment is from the orchestra of the "Palace," Bath, where the driver of the machine, E. Longden, is the manager, and where George Newburn recently gave performances.

"QUALITY" first!

—Always, and at all times, have we placed QUALITY first—consequently we offer you in The PEDLEY Tire a production worthy of our name and the "HIGHEST" QUALITY" reputation associated with that name since the year 1840.

—QUALITY in a Tire spells EFFICIENCY and LONGEST WEAR, and the maximum of comfort with immunity from trouble.

—If you are out for a "QUALITY" Tire, you certainly want The

'PEDLEY' 3-rib non-skid

and should invest in one without delay. Let us send you a section—or a sample Cover—for your inspection—or ask your Agent to show you a PEDLEY Tire and when you have noted its marked merit you'll be sure to buy.

COVERS (26 × 2¼in.), Beaded Edge .... **48/- each.**

Inner Tubes, 10/3; or Extra Heavy ditto, 12/- each.

—Ask for our "PEDLEY TIRE" Folder—it gives particulars of this and a host of equally valuable rubber requisites.

HOUNSLOW TO HOOK.

A DELIGHTFUL TWENTY-FOUR HOURS' RUN.

I put on several pairs of socks,
And clothed myself in wool,
Packed up the turkey-sandwiches,
And saw the flask was full.
I wrung my driver by the hand;
"Robertson Brown," said I,
"To-night away to Exeter
With you I'll do or die."

Our engine was an Ivy-P.,
Whose horse-power was not great:
Four and a quarter had to pull
The coachbuilt sidecar's weight;
How much it had to pull that night
Will later on appear,
When I describe in glowing terms
Our trouble with the gear.

The Turner sidecar was a treat—
All weather it defied;
Moreover, it had road-bump-proof
Upholstery inside.
Our lamp, a hefty F.R.S.,
Orion's belt outshone
(Orion might have wished that night
He'd got a chain drive on).

The poets, so I am informed,
Who lived in ancient days,
Chose attics underneath a roof
Wherein to write their lays.
But I'll write 'neath the open sky,
Said I, without regret;
Inspired by frost if it is fine,
If not, inspired by wet.

At Hounslow there were gathered all
Great Britain's choicest bloods;
Dame Fashion had provided joys
In overalls and duds.
Thank Goodness! there was rain enough,
For, had there been no squalls
And had the night been dry, think what
A waste of overalls.

I saw "I'm It" with twenty-two-
Inch wheels and strange air springs,
And Mundy lowering his gear,
And Vernon Taylor's wings,
And Thompson with his green stream-line
Which all design out-knocks,
And Thomas Frank and O. P. Hill
With crackers in a box

We started from Bulstrode Hotel
To ride the long night through;
Our hearts were stout, our clothes were thick,
Our sou'-westers were new.
But man proposes Exeter,
While Fate, who's always near,
Steps in and utterly upsets
The meshes of the gear.

It was on Egham's little hill,
And somewhere near the top,
Our engine seemed to grow quite tired,
Then faltered to a stop.
Examination in the dark
Evolved the simple fact
That both the gears were in at once,
And neither would retract.

Adjustments made, we journeyed on,
But up hill it was plain
The high gear, acting on its own,
Had sidled in again.
Ignoring the controlling rod,
That high gear would assert
Itself on awkward gradients;
The lower gear felt hurt.

Although as yet we'd hardly got
As far as Hartley Row,
It seemed as though we must have done
Two hundred miles or so.
A mile at moments such as these
Is made of every yard,
And every little eminence
Becomes as steep as Chard.

"The time has come," I said to Brown,
"To talk of many things,
Of ratios and formulas,
Of Karslakes and George Kings."
But Brown replied, "Would I were back—
We still are far from Devon—
At home in pleasant Portland Street,
Number one-fifty-seven!"

And still the engine pulled and pulled,
And didn't stop to bask;
The Ivy clung hour after hour
Right bravely to its task.
Vainly the gear put on the brake,
For still the engine turned;
The Watawata held, although
The gear-bearings were churned.

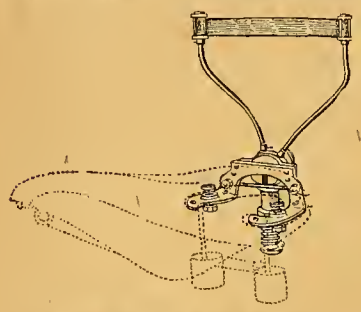
Which showed what pluck the engine had.
But, hang it all! ye gods!
When both the gears are in at once
Too fearful are the odds.
Some sage advice I gave to Brown
(It came too late, I fear),
"If I were you I wouldn't let
The hub control the gear!"

Upon a slightly sloped incline,
Where mud was thick and svelte,
The high gear hit the lower gear
Somewhere below the belt.
And then we stopped and tinkered things.
Hopeless was our outlook
Till someone told us we were but
A short half-mile from Hook.

A pleasant little spot is Hook,
Not far from London Town;
The villages of Devonshire
No doubt deserve renown,
But Hook in Hampshire's pleasant realm
Is quite as good a spot
As Exeter for writing odes
And mild poetic rot.

We might have gone to Exeter,
'Mid wind and sleet and showers,
Or wallowed in Wiltonian floods
For hours and hours and hours.
Instead of that old Destiny
Rough-hews us as it will,
And bids us stop the night at Hook,
Where we are stopping still.

O, Hook! Sweet Auburn never was
So sweet as thou to us!
Thy charms in poetry or prose
I could at length discuss.
Though Yeovil has its "Mermaid" fame,
And Exeter its "Bude,"
Hook with a temperance hotel.
"The Acorn," is endued.



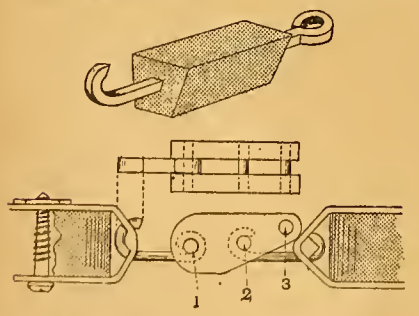
Some have to Middle Wallop gone,
To where Windwhistle blows,
To Crewkerne and to Honiton,
And places such as those.
Well, let them go, as to the Pole
Went Shackleton or Cook,
While we will pause upon our way—
We've got as far as Hook!

FRED GILLETT.

AMONG THE ACCESSORIES.

A Home-made Back-rest.

The backrest of which we append a sketch has been sent us by Mr. H. B. Jeffery, Carter's Corner Place, Aylesham. The device is intended to fit to the bolts which hold the upper ends of the saddle springs to the cantle. The plunger, working in a brass cylinder and controlled by a spring, is adjusted so as just to clear a metal plate passing across the luggage carrier, the adjustment being made when the rider's weight is not on the saddle. The chief advantage claimed for the rest is that the support falls to one side, thus leaving the carrier free for luggage. Back-



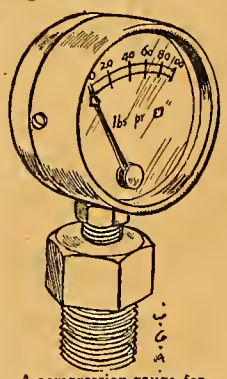
An automatic home-made back-rest.

rests which fall back and down when not in use necessitate the luggage being either placed very far back on the carrier, or left off altogether, because if the bag were in position the rest could not fall flat. Mr. Jeffery informs us that the sample he has made works very well on his own machine, although being only a rough home-made model and unnecessarily heavy.

Adjustable Belt Fasteners.

Adjustable belt fasteners are very handy when raising or lowering the gear and obviate the necessity for carrying another belt of smaller section. They have, however, the following disadvantage. When the long links are in use there is a rather large gap between the ends of the belt which must cause a certain amount of slip. To overcome

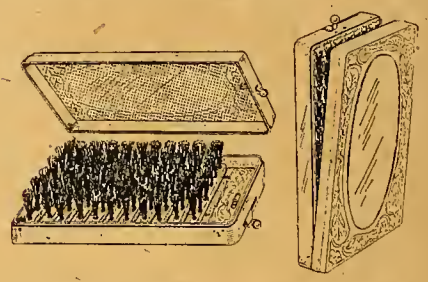
this trouble Mr. Stanley T. Robson, 59, Holmoor Road, Birmingham, has brought out some links fitted with small sections of belting which enable the drive to be taken up on the link as well as the belt. We illustrate two types—one made for the ordinary Simplex fastener the other for Mr. Robson's special fasteners. The links, which give various lengths, can be made to suit any type or make of belt.



Sleeve Protectors—Compression Gauges.

On the occasion of a recent visit to the depot of Hunt's Stores, 117, Long Acre, W.C. a handsome and moderately-priced lamp and generator were shown to us. The lamp is well designed, and is fitted with a Bausch and Lomb lens mirror, which is held in position by screws, so that it can be easily detached for cleaning purposes. The whole of the lamp is made up with either rivets or screws; there is no soldering. The hinge of the front door is very strongly made, and the burner is adjustable. The generator has a smooth exterior, so that it can be easily cleaned, and it is inter-

Protectors which keep the sleeves clean when undertaking small repairs.



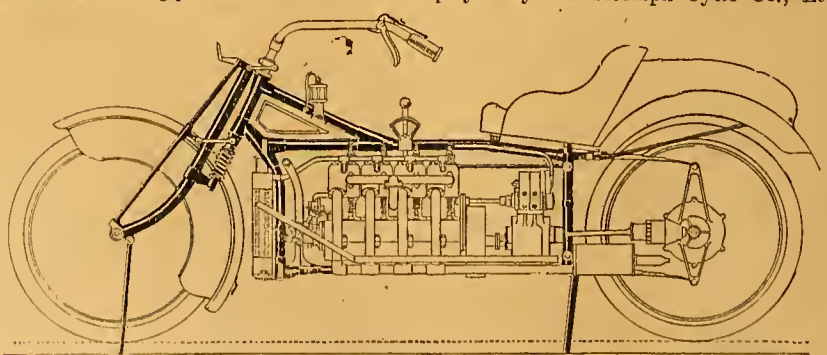
esting to note that with the complete outfit an armoured connection is supplied. It is always nice to know the exact compression of one's engine, and, to enable motor cyclists to be in possession of this useful knowledge, this firm have placed on the market a compression gauge, which indicates to 100 lbs. to the square inch. The gauge, which is not intended to be in position while the engine is running, is made to suit the thread of the sparking plug hole. Other useful articles which are of special interest to our readers, now that the cold weather is with us, are a woollen throat protector, which is slipped over the head and forms protection for both throat and chest, and sleeve protectors, to prevent the coat sleeves from becoming soiled; these protect the sleeve about six inches up from the wrist, and are exceedingly useful.

A compression gauge for motor cycle engines.

A Collapsable Clothes Brush.

One of the neatest little accessories which has ever been brought to our notice is a small collapsable clothes brush which we illustrate. The case containing the brush is only about the size of a small cigarette case, measuring 4in. × 2⅛in. × ½in. thick. When the buttons, shown at

one end are twisted the cover comes off, and by pulling the button on the bristle portion towards one, it moves a small lever which causes the rows of bristles, which have previously laid flat in the case, to rise ready for use The case is of such handy proportions that it can easily be carried in the toolbag or the rider's pocket. This novelty can be obtained from the Rudge-Whitworth Depot, Hertford Street, Coventry.



New West End Saleroom.

West End readers will welcome the information that John Barker and Co., Ltd., High Street, Kensington, W., have opened a special department to deal with motor cycles. This firm is catering for motor cyclists in the same manner that it has already dealt with autocarists, and is prepared to supply the best known makes of machines for cash or easy payments. John Barker and Co., Ltd., have such machines as Humbers, Premiers, Singers, and Triumphs, in stock and ready for instant delivery.

New Appointments.

R. H. Bell, who for some years past has been the Midland representative of Palmer Tyre, Ltd., severed his connection with that company at the end of the Old Year to take up the position of sales manager to the Clyno Engineering Co., of Wolverhampton.

A. L. Ommanney, until lately with Rudge-Whitworth, Ltd., is now employed by the Triumph Cycle Co., Ltd.

Latest design of the four-cylinder three-speed T.M.C., which, as will be observed, has a water-cooled engine and bevel drive. The new model is more than ever "a car on two wheels."

N.W. London M.C.C. Open Trial to Gloucester.

UNDER fine weather conditions, on Saturday morning last, sixty-two competitors were despatched from Jack Straw's Castle *en route* for Gloucester. Each man had to make a non-stop run from Hampstead to the top of Dashwood Hill. Over this section, H. F. S. Morgan (Morgan) was early in trouble and later in High Wycombe we passed F. W. Applebee (2 h.p. Centaur) by the roadside with a plug blown out. He eventually climbed Dashwood Hill with a 7½ to 1 gear and l.p.a. Griffiths (2 h.p. Alcyon) was another competitor to make a stop before reaching Dashwood, owing to a broken belt, but surmounted Dashwood with a 6½ to 1 gear and l.p.a. Jack Woodhouse (3½ h.p. O.K.-Precision) lost his oil pump plunger, and was obliged to ride some considerable distance without lubricating his engine. From the top of Dashwood Vernon Taylor (Rudge) and Jack Woodhouse took a couple of young ladies on their carriers into Oxford. Here the first check was held, at Morris's Garage, where hot Bovril and sandwiches could be obtained. Thence the route lay through Farringdon, Cirencester, down Birdlip Hill, to Gloucester. Just after passing through Farringdon, Vernon Taylor, when overtaking a horse and trap on the inside, hit the bank, and consequently had a nasty fall. Luckily, he was unhurt, and did not seriously damage his machine, only slightly bending the footrest. For some distance we kept company with R. Holloway (3¾ h.p. twin Premier), whose machine appeared to be running very sweetly.

Greasy Tramlines and the Result.

The tramlines entering Gloucester were in a terrible condition. Here we found F. E. Pither (Rudge), who had broken his throttle wire and had tried to get going with full throttle. In the grease the result was that directly his engine fired the back wheel slipped under him. After reversing his air and throttle barrels, with the aid of a push he managed to start. Vernon Taylor appeared to be very unlucky, as he was again brought to the ground. Pither skidded just in front of him, both falling in a heap.

Lunch was served at the Spread Eagle Hotel, Gloucester, where competitors were checked both in and out. The route home was the same.

Climbing Birdlip.

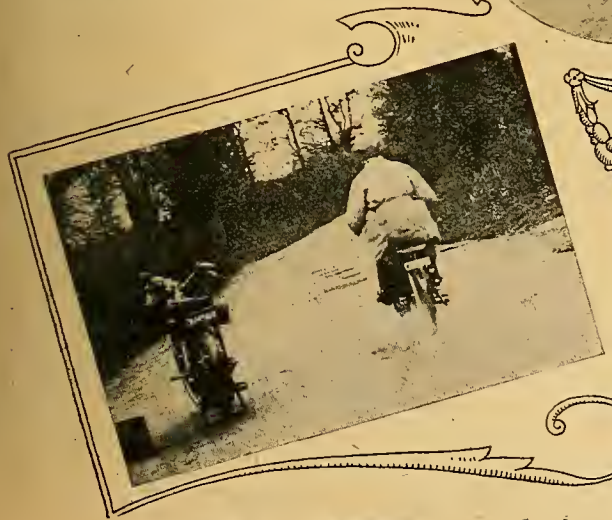
At the bottom of Birdlip many of the competitors stopped to cool their engines and lower their gears. Cut-outs were not allowed to be used, and this undoubtedly accounted for a lot of the failures on this hill. Griffiths, unfortunately, broke his belt halfway up, but after repairing same and starting up on the stand, using back tyre and road as a clutch, he successfully reached the top in the saddle with the help of l.p.a. H. Foote made an excellent ascent on his 8 h.p. overhead-valved Bat, geared 3½ to 1. C. Roberts came round the corner on his 3½ h.p. Arno "foot slogging." R. G. Mundy (3½ h.p. clutch Singer) came up well, being somewhat baulked by a horse and cart on the corner.

Competitors were again checked at Morris's Garage, Oxford, where tea and sandwiches were supplied. Lamps appeared to be somewhat troublesome, several competitors being hung up on the road attending to same. Aston Rowant Hill was in a shocking condition at the top, being more like a ploughed field. On the whole, the roads were in a very fair condition considering the amount of rain that has fallen lately. At the bottom of Dashwood Hill we passed G. N. Higgs on his Briton car, he having been at Hampstead in the morning to see the competitors start. On the fairly stiff, though short, hill out of High Wycombe, on the road to Rickmansworth, several of the competitors failed. We passed J. Oliphant (3½ h.p. Premier and sc.), who had failed near the top.

Unpleasant Conditions.

From here the ride was anything but pleasant, being over greasy and very twisty roads, with occasionally some fog. Several of the competitors, being late at High Wycombe, only had one hour to cover the last thirty-two and a half miles; two or three, however, managed to do it in the time. On arrival back at Jack Straw's Castle, we found a very large crowd being kept under control by several policemen.

The route was very clearly marked by means of arrows, and the N.W.L.M.C.C. must be congratulated on the way this competition was held, considering this is its first open run. Hugh Gibson (3½ h.p. chain-driven Bradbury and sc.) reported a nasty spill. Near Wheatley the front lug of his sidecar broke, so he induced another competitor to carry his passenger on the carrier.



Mishap to a Sidecar.

After strapping it up, he proceeded, but at the top of Aston Rowant the strap slipped, letting the sidecar down and throwing Gibson. He left the sidecar in the ditch and finished solo. Jack Woodhouse was very late in reaching Hampstead, and reported having carried a lady some twenty miles on his carrier. A non-competitor, who had followed the trial on a S.I.A.M.T., having apparently fallen asleep while riding, had

N.W. LONDON TWELVE HOURS' TRIAL TO GLOUCESTER AND BACK.

A competitor at Northwood.

On the way to Gloucester.

Humber and Enfield riders at Oxford on the return journey.

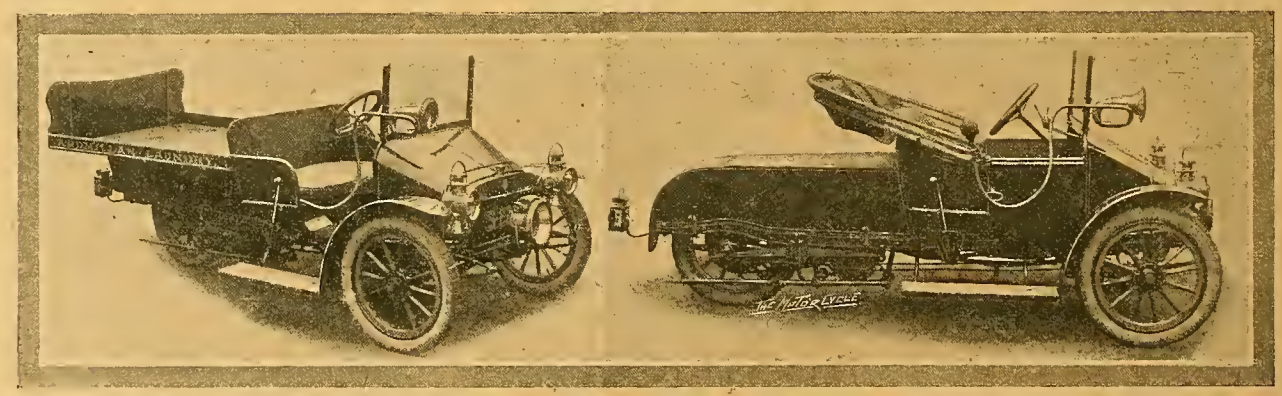
N.W. London M.C.C. Run to Gloucester.—

been brought in on a Zenith sidecar, the lady passenger riding on Woodhouse's carrier. H. G. Dickens (Clyno and sc.) smashed up his timing gear the other side of Oxford on the outward journey. Hal Hill, who had entered his ancient 3 h.p. Centaur, was unable to ride it, as the exhaust valve lifter broke just before starting; he therefore fetched his T.T. Bat, and successfully completed the run.

The awards were made as follows:

Silver cups to those who did not lose more than fifteen marks on each journey.

Silver medals for a loss of twenty marks.



Bronze medals for a loss of thirty marks.

The Survivors.

THE PRICE OF MOTOR CYCLES.

Sir,—In the issue of *The Field*, dated November 25th, there is an article dealing with the recent Motor Cycle Show at Olympia. The third paragraph discusses the price of the motor cycle of the present day, and, in my opinion, the remarks contained therein are reasonable and justified. I trust you may therefore find space in your columns for a discussion on the subject, and that we may hear the manufacturers' side of the question.

The paragraph quoted is as follows: "There is one point upon which a complaint seems fairly reasonable. Motor bicycle manufacturers do not appear disposed to give their customers the full benefit of that cheapening in construction which we all know to follow greater familiarity and wider use. On almost every stand the standard motor bicycle is listed in a condition in which it is not going to be sold. The necessary additions are, however, included as 'extras.' A 1912 motor bicycle without a free engine clutch is an anachronism, yet where its cost is not plainly observable in the figures asked, it is boldly charged as an extra. Then again, two and three-speed gears, to be quite frank, are not offered at commercial prices. Ten guineas extra for a three-speed hub and seven guineas for two-speeds must strike any engineer as inviting a large measure of exclusiveness, and compare badly with the prices charged in motor car construction. Possibly patents and similar rights have to be blamed for this, but it will appear to many people as calculated to strangle rather than assist the popularity of variable geared machines—the next stage in the evolution of the perfect motor cycle."

I have quoted the whole paragraph, but, to my mind, the crux of the whole question lies in the first two sentences.

My own predilections are in favour of a powerful machine which, to quote a well-worn phrase, "will take a sidecar anywhere." It is difficult to quote a specific case without mentioning the name of the machine, but to take my own case as an example. The machine which I have provisionally decided on purchasing had for 1911 a drive and gear of a certain type. Presumably, this did not prove entirely satisfactory, as considerable alterations have been introduced for 1912. At the same time the price of the machine advances by two or three guineas. In other words, the customer and not the manufacturer has to pay for admittedly necessary improvements. Now this is certainly not the case in car practice, and should not be in the case of motor cycles either. I have been absent from England for some time, and cannot help noticing the considerable advance in the price of motor cycles all round.

I remember a few years ago a discussion in the motor car press as to whether it was possible to produce a reliable small car for the sum of £100. I foresee in the near future a discussion on similar lines as to whether it is possible to purchase a reliable high-powered motor bicycle with sidecar and necessary extras for less than that sum.

One has only to study the excellent "Buyers' Guide" which you published at the time of the Show to realise the point of my prediction.

Apologising for the great length of my communication,

MODERATE MEANS.

B20

Round the Spring Quarterly Trials Course.

THE HARROGATE AND DISTRICT M.C.C. WINTER RELIABILITY TRIAL.

COMPETITORS IN THE HARROGATE AND DISTRICT M.C.C. WINTER TRIAL.

Group of competitors and officials previous to the start from Harrogate on the 27th ult.

G. Hill (3¾ h.p. Scott and sidecar) the only passenger driver to start who, although losing eleven marks, made an excellent performances Sutton Bank proved the set back.

STARTING just after dawn on the 27th ult., the only passenger machine in this trial proceeded on its journey, and, half an hour later, the solo machines were despatched at minute intervals to do their best to cover 146 miles (exactly to schedule time) of probably the most difficult roads chosen for a winter trial. The route was Harrogate, Thirsk, Sutton Bank, Rivers Bank, Helmsley, Pickering, over the Moors, and up Spring Hill to Whitby, where lunch was taken at the Royal Hotel. From Whitby the coast road was taken to Saltburn, including Lythe Bank and Saltburn Hill; afterwards the run home *viâ* Stokesley and Ripon was comparatively easy. The weather overhead was all that could be desired, but the roads were most treacherous. In parts they were frozen and dry, but suddenly the surface would change into perfect quagmires. The danger was increased at night when riding with lamps lit, it being then practically impossible to tell whether one was riding in mud or ice.

Sutton Bank in Winter.

Of the eighteen entrants fifteen started in excellent spirits, but Sutton Bank soon proved a damper, for quite a number failed on this famous ascent at the first attempt. Rivers Bank likewise accounted for one or two failures, but only two competitors had lost time up to lunch. In the afternoon Lythe Bank was the scene of a few failures, as was Dalehouses, but, strange to relate, no one failed on the twisty Saltburn Hill, and it was probably as well, for a check was arranged at the top of this rise.

Soon after leaving Stokesley lamps had to be lit, and, as usual, a few competitors had trouble in that way. Nevertheless, seven riders reached Harrogate dead on time, and were welcomed by an enthusiastic crowd. Difficult as the course was, it proved impossible to find a winner, for two riders tie for first place. The result, compiled from the checkers' cards, but which has still to go before the committee for confirmation is as follows:

The Results.

T. C. Atkinson (3½ h.p. T.T. Triumph).—Lost no marks and had no trouble.

F. Mackay (3½h.p. F.E. Singer).—Lost no marks and had no trouble.

F. Philipp (3¾ h.p. Scott).—Lost 1 mark and had no trouble.

T. Maynard (3½ h.p. F.E. Triumph).—Lost 6 marks.

J. J. Day (3½ h.p. Bradbury, two-speed).—Lost 10 marks; lost way and ran into hedge.

W. E. Grange (3½ h.p. Bradbury).—Lost 1 mark; puncture.

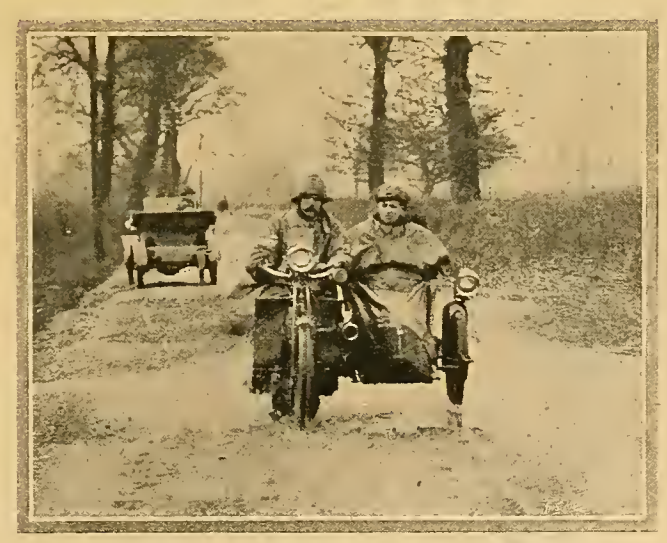
F. Strafford (3¼ h.p. Humber, two-speed).—Lost 2 marks, failed Sutton Bank.

W. Prescott (3½ h.p. Bradbury, two-speed).—Lost 2 marks; ran into wall and damaged lamp.

W. B. Atkinson (3½ h.p. Triumph).—Lost 4 marks; side-slip and warped exhaust valve.

J. Mackay (2½ h.p. Singer, two-speed).—Lost 5 marks: no trouble.

H. W. Fortune (3½ h.p. Triumph).—Lost 8 marks: failed Sutton Bank and had lamp trouble.



G. Hill (3¾ h.p. Scott and sidecar).—Lost 11 marks; failed Sutton Bank.

C. Nettleton (2¾ h.p. New Hudson, three-speed).—Lost 100 marks; failed on Sutton Bank, lost way, and had lamp trouble.

C. P. Finn (2¾ h.p. Enfield, two-speed).—Arrived at start with bad puncture, afterwards failed on Sutton Bank, so retired.

Gibson, Tindall, Spencer, and Strother did not put in an appearance at the start.

THE LONDON TO EXETER AND BACK RUN.

A Clyno sidecar at the water splash near Milbourne Port, between Sherbourne and Shafteshury.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

A Trio's Troublous Trip.

Sir,—We should like to congratulate "FAF" on "A Trio's Troublous Trip," published December 21st, as we happened to be the good repairer up a side street. Only the staff knows how hard and often the pulley was hammered and thumped to get it off, and well we remember, from what we saw, that after they could not remove the pulley from the engine, they tried their best to take the engine from the pulley; bolts and nuts everywhere. But a happier trio could not be met on the Cambridge Road.

F. BROWN AND CO.

Winter Mudguarding.

Sir,—I am pleased Mr. Ernest Frasetti has accepted my challenge, for he is not entirely unknown to me, and I am one of his greatest admirers, for I think some of his week-end journeys are marvellous, the most notable being, of course, his run from Southampton to Aberdeen. It will therefore be a pleasure to meet such an able and representative "chain driver," and should I be the individual to come out on top in our little "dust up," it will be something to my credit. If on the other hand I am beaten, my consolation will be that I shall have lost to a sportsman and a gentleman. As he has put his cards on the table and exposed his hand to me, I will tell him that I shall ride an 8 h.p. Dot with V.S. two-speed gear.

I have a few more nuts to undo than he has, but everything is quite simple with regard to the removal of the wheel, and he will have to "gallop." Now, as Mr. Frasetti probably knows, I am a musical hall manager, and cannot get away for any length of time (he will have a good idea when I can afford the time), so if he will suit his own convenience with regard to the date and district, I shall look forward with pleasure to our meeting.

ERIC LONGDEN.

Waterproof Motor Cycle Clothing.

Sir,—We beg to thank you for your courteous reception of our letter upon the above subject.

You ask, Why do trial competitors invariably don oilskins if they think they are in for a soaking day's ride? If they do don these garments with the idea that they will be better protected, it is because they have only had experience with cheap, trashy, rubber-proofed suits. If they had once tried a good quality material, they would never be seen in oilskins again. The bulk of rubber-proofed motor cycle clothing on the market to-day is not fit for the purpose for which it is intended.

As a counter question to yours, we would ask you why is it that one of the largest firms of motor cycle manufacturers have bought some dozens of our better quality motor cycle suits solely for their testers to wear? We think this speaks for itself, as efficiency and durability are the primary considerations in the case of testers. We have sold many hundreds of motor cycle suits, and have not had a single complaint of their becoming soddened or unproofed. No doubt there are many ill-designed and bad quality motor cycle suits sold in the effort to appease the demand for cheapness. It is a great mistake, as motor cycling is rough wear upon such garments, consequently they should be made of good materials.

We are certain that a good rubber-proofed motor cycle suit will be eventually cheaper and more efficient than oilskins. We can supply such suits which will withstand hard wear and pouring rain for twelve months, and then will keep the rider perfectly dry.

THE DUNLOP RUBBER CO., LTD.

Will the Ultra-lightweight Return?

Sir,—The letter in your issue of December 21st (page 1399) voices the need of hundreds of people who live in country places a few miles from the nearest town. Many such people have tired of the push bicycle, yet cannot rise to the upkeep of the ordinary motor cycle, but they would gladly purchase a cycle after the specification in J. Hart Smith's letter.

S. EDGE.

Sir,—With regard to J. Hart-Smith's specification, "An engine developing 1 h.p. actual, slung into a Rudge-Whitworth de luxe cycle frame."

Perhaps he has forgotten the different stresses and strains the engine would cause when in use on the road. The drive is not like the smooth pedalling of a rider, but a rough gun-like action instead.

I think that a gear of 13½ to 1 on a long hill would very likely overheat the engine; so much so that, in spite of pedalling, the machine would stop. I think that in actual use a 1½ h.p. built into a lightweight motor cycle frame is about the lowest h.p. for all-round use on the road.

T. MERINGTON.

Multi-pole Sparking Plugs.

Sir,—I notice in your issue of the 21st ult. a letter from Lodge Bros. and Co. in answer to letter signed E. P. Thomas (page 1370) in which they say there is no necessity to go to the expense of fitting a double spark magneto, as precisely the same result can be obtained with an ordinary magneto and double pole plug. Now the Bosch Magneto Co. have already told us in *The Motor Cycle* that an ordinary magneto used with a double pole plug will cause damage to the armature winding. As both the above mentioned firms happen to be experts, may I ask what the poor layman is to think? Both firms cannot be correct, so perhaps they will be so good as to tell us poor seekers after knowledge whether a double pole plug used with an ordinary magneto does or does not injure the armature winding and *the reasons*.

ONE OF THE SEEKERS.

Where to Pay Local Taxation Licences.

Sir,—As a London man, I wish to make some little protest against Mr. W. H. Browne's letter. I am in agreement with his desire to penalise the "unclean counties," but, as far as London is concerned, the matter is on a different footing. The cost of maintaining the Metropolitan Police is partly borne by the London County Council, but beyond this the London county authority has no control whatever over the Metropolitan Police District (extending from Esher on the west to Dartford on the east). The responsibility for police traps rests entirely on the Imperial Government (the Home Office, I believe) in general and the Superintendent of the Metropolitan Police in particular. There is no reason, therefore, why licences should not be taken out in London, as the county authorities cannot reduce the number of police traps.

I believe also that in the matter of ten-mile limits the London County Council has been unsympathetic to the appeals from the local boroughs for unnecessary scheduling.

PHILIP S. WHITE.

Sir,—Every motorist, I think, will agree that the advice contained in Mr. Browne's letter is worth following, as an organised boycott of the counties in which police traps are regularly worked is the best means of forcibly drawing attention to what is a most vindictive practice. According to the daily papers, the tradesmen in Gosalming are

beginning to feel the effects of the boycott instituted by the motorists in the district, owing to the traps in the town, and have applied to the council to do away with the same. If a boycott of the county councils themselves were brought about, I should say more notice would be taken of it, as the councils would lose the money, whereas, in the instance quoted, the tradesmen suffer, who are not responsible for the trapping.

With regard to the county of Derbyshire, which is given in Mr. Browne's list, I can say the police methods could well be taken as a model by other countries, especially those in the South, as I do not know of any traps or prosecutions simply for exceeding the limit. A few cases of dangerous driving have been taken up, and in these it has been proved beyond doubt that the drivers were to blame.

As secretary of the Derby and District M.C.C., I have on all occasions been treated with the utmost courtesy by police officials when arranging trials, hill climbs, etc., in the district.

I do not know whether the postal officials undertake to forward receipts for licences, but I make the offer to motor cyclists residing in trap infected districts, that if revenue forms, duly filled up and signed, be sent to me (13, Wilson Street, Derby), with covering cheque or postal order, I will undertake to pay same here and forward official receipt.

A. B. BENNETT,
Hon. Sec. Derby and District M.C.C.

Proposed Abolition of Cut-outs.

Sir,—I have ridden a lot this summer with a 1911 3½ h.p. and sidecar of popular make, and have had many an enjoyable run, but if my "cut-out," which is only necessary to use on hills, were made illegal those hills would become impossible. I quite agree that a powerful machine with an open exhaust can be, and frequently is, a nuisance to other road users and the public generally, but there can be no doubt that the poor owner of a 3½ h.p. and sidecar, if his "cut-out" be prohibited, will find it impossible to use his sidecar.

E. J. WRIGHT.

Handicapping Club Competitions.

Sir,—Is there any workable method of handicapping successful competitors in hill-climbing competitions? In our club, of about 100 members, we know for a certainty that our six hill-climbing competitions this year will be won by not more than five members. It must be admitted they are all real good tip-top men, capable of holding their own with the best, but a club is not run for the benefit of anyone or a dozen members, but for the whole body. When there are such good men in a club, it is useless for the average rider to compete. He has absolutely no chance at all, and never will have until some workable form of handicapping is universally adopted.

C. B. ROBINSON,
Hon. sec. Westmorland M.C.C.

The Tyre World.

Sir,—"Ixion," in his "Occasional Comments," touches upon one of the most vital forehead-creasing troubles in the motor cycle world, viz., suitable tyres. It is apparent that the much lauded types standardised by nearly all motor cycle manufacturers are totally unsuited to the general requirements of users who claim to do any long distance riding.

Why will not these manufacturers fit wearable covers, which can be honestly recommended, and be part and parcel of their productions?

When will they wake up to the fact that a really good hard-working cover, listed, fitted, and advertised as a coadjunct, will tend to sell their machines?

There is no reason to run round the world and back again to seek the reason of many of these firms fitting unwearable and cheap covers. The fact is that they buy in the cheapest market, and when the machine is sold, their liability, as far as tyres are concerned, becomes a negligible one. Any ensuing trouble has either to be taken up against the tyre manufacturer by the motor cyclist, or his agent.

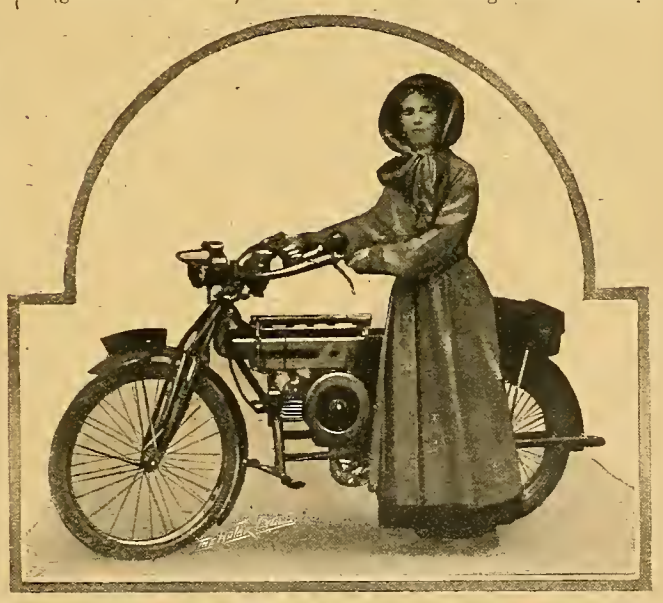
In the last Six Days' Trials the "penny wise and pound foolish" policy of fitting cheap and nasty tyres was painfully plain to see. The writer was present and saw two competitors actually wear out five of these unsuitable covers during the 1,000 odd miles.

FREDK. J. THISTLETHWAITE.

Hill-climbing.

Sir,—Mr. A. Newman suggests a tour for Mr. Frank Smith's Clyno and sidecar, and, amongst other places, he includes Honister Pass. I suppose he knows the road or else he would not mention it, but he might as well ask Mr. Smith to ride up Great Gable. I know the Buttermere district, and have frequently walked up and down Honister, and only last Easter I helped to turn a 90 h.p. racer round which had failed to get up. The road is at least eight inches deep in loose slag, and it is absolutely impossible for any motor vehicle to climb it from the Buttermere side, at least in my opinion. I do not think Mr. Newman is quite sporting in asking Mr. Smith to accomplish the impossible.

FAIR PLAY IN ALL THINGS.



How to Prevent Side-slip.

Sir,—I have read your interesting article on the above, but have never seen mentioned the advantages in grease of a free engine when handle-bar controlled.

I find that when riding over a specially greasy patch, and I wish to reduce the speed of the motor cycle, it is very much better to slip the clutch and race the engine a little rather than check the speed of both the engine and cycle by raising the exhaust valve. I suppose gyroscopic action must come into play; at all events it arrests the slip of the road wheels and steadies the machine immediately. I may say I have my clutch control fitted on the right handle-bar grip and the exhaust lifter on the left, so that if the noise of the explosions gets unpleasant when engine is running free, I simply raise the lifter and the engine continues to revolve without noise. This gives a very nice control.

GUY WROWE.

Sir,—I see in *The Motor Cycle* of the 21st ult., a photograph of Miss Hobson, who says she believed there is only one other lady in Lincolnshire who rides a motor cycle. I am enclosing you a photograph of myself and 2¾ h.p. Douglas (gentleman's model), which I have been riding since last July.

Miss Nellie Drury and her diamond-frame Douglas. She is supposed to be the third lady motor cyclist in Lincolnshire.

During that time I have ridden about 1,500 miles, my longest journey being on July 23rd, when I rode from Sturton-by-Stow to Yarmouth, a distance of 131 miles, in eight hours.

I find no difficulty in managing the machine, having had the saddle removed and a seat fixed on the carrier. I have also had guards fixed over the belt and engine. As regards dress, I think an ordinary walking skirt and long mackintosh quite suitable. I agree with Miss Hobson that many more ladies would join the ranks if they only knew how simple and fascinating a motor cycle really is.

NELLIE DRURY.

Tolls and Taxes.

Sir,—I should like to express my approval of the remarks of "C.R. 10:0" in your last issue. At the time of the naval review at Spithead I and a few friends motored to Portsmouth. We went from Southampton by way of the Bursledon Bridge and paid the toll of 3d. each. Being strangers to the district, we were unaware that a return ticket could be obtained for 4½d., neither were we enlightened. We were very surprised upon our return the same day to find another 3d. per head demanded, as we certainly thought that one payment would take us through upon both occasions. I think, with your correspondent, that it is high time such impositions as these were abolished.

THOS. C. OWEN.

Lubrication Systems.

Sir,—In your recent article on lubrication systems you mention some disadvantages of the splash system as applied to the internal fly-wheeled engine big ends.

Now in an external flywheel engine two of these disadvantages are eliminated. The big end dips right into the oil at every revolution, thus getting far better lubrication than if flywheels were there to fling the oil away. Also the balance weights of the single piece crankshaft dip, throwing enough oil on to the cylinder walls. Again, owing to there being no internal flywheels, there is hardly any power absorbed by internal friction of the oil.

Take an internal flywheel engine, remove cylinder or piston, and revolve the engine by hand, taking hold of the top end of connecting rod, and if the crank case has the usual amount of oil in it, quite an appreciable resistance will be felt, while if the crank case be dry and no oil on the flywheels it is surprising how much more easily the engine revolves.

Now take the grooving of big-end bushes. My idea of lubricating the big end is to get the oil there and keep it there, and not allow it to escape by other grooves, like one engine I know, which has the bearing surface of the big end reduced almost by a third by a number of spiral oil grooves. The oil is supposed to get in by one end of the grooves, and what does get there travels through the spirals out to the other end bush. This, I think, is an absurd arrangement, because the oil should stay in the bearing, and should only escape after having lubricated the surface of crank pin and bush.

One system of oil grooves which I used with great success was to drill the connecting rod with two holes from the top (of big end), leading to two horizontal grooves half-way down the bush, these grooves having blind ends. The oil got there, of course, and only escaped after doing useful work, lubricating the bearing properly.

The size of big-end bearings is not sufficient, too. When we realise that the present-day big end is about the same size as the old De Dion tricycle engine, it is absurd to imagine that these bearings will wear properly when we load them to the extent of another 50% h.p. This, of course, is leaving out the question of bearing material, lubrication, and engine speed.

One thing which I am sorry to see discarded is plain bearings for the engine-shaft. I certainly think that engines used to run more sweetly than those fitted with ball bearings, as there was a certain cushioning effect with the former, whereas with the latter I think engines have a certain amount of "ring" about them caused by ball bearings. It is not an unknown thing for a ball race to come loose in the crank case. Then what is to be done? Either try and find another ball race which is a better fit, or fake the old one, by nickel plating it for instance, so as to make it a tight fit.

It would be interesting to hear the opinion of riders of external flywheel engines and others on the above points.

AMATEUR.

The Quality of Modern Tyres.

Sir,—With regard to correspondence on the quality of modern tyres. I purchased recently a heavy studded tyre, guaranteed for 3,000 miles. After a 600 miles tour I found the studs worn away. I wrote the makers for an explanation, but receiving no answer wrote again, and am still waiting and this is the way they carry out their promises.

J. S. TURNER.

A Suggestion for Second-hand Sales.

Sir,—A difficulty often arises when one, as a private advertiser, is disposing of a motor cycle, as the purchaser seldom brings the amount in cash, and in dealing with strangers it is unwise to accept a cheque. Quite recently I advertised a machine for sale in *The Motor Cycle*, and a gentleman travelled a long distance by train to inspect it. He decided to buy, but the amount being between £50 and £60, naturally could not hand me the purchase price in cash, and although, as far as appearances went, everything was in his favour, I could not bring myself to accept his cheque; we therefore decided upon the following plan. The cheque was handed to me, and the machine deposited with the proprietor of a well-known garage, to whom we both handed our visiting cards, and the undertaking was entered into that the machine was not to be released except in the presence of both parties, an appointment being fixed for three days later. In the meantime, the cheque was cleared, the appointment duly kept, and the machine handed over to its new owner. I daresay quite a number of holes might be picked in the arrangement if viewed from a strictly legal standpoint, and one of them would be that we could not make the garage proprietor responsible. The plan worked excellently, however, in our case, and it might, we thought, be acceptable to other persons placed in a similar situation. The advertisement appeared on a Thursday morning and the machine was sold the same day, while on my return home a caller was waiting, purchase money in hand, and I subsequently received several additional offers.

SATISFIED.

SUMMARY OF CORRESPONDENCE.

"Pedal Cyclist" wishes to warn readers not to fill the carbide containers of combined lamps or separate generators more than half full at most. He has seen several motor cyclists fill the container without allowing for expansion, with the result that the decomposed carbide formed into a solid, practically, gas-tight mass, thus choking the gas outlets.

The motor cycle section of the Coventry and Warwickshire M.C. assembled for the "Yuletide" run last Saturday.

QUESTIONS & REPLIES

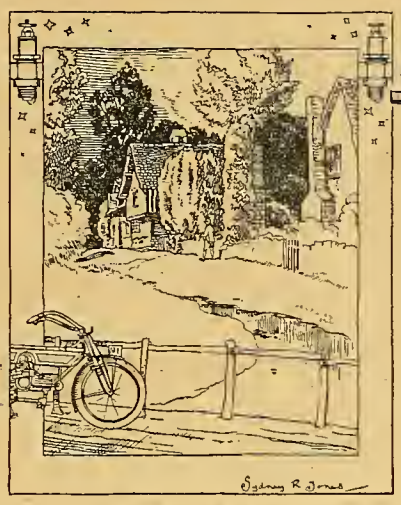
A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

The Steepest Hills.

Will you oblige me by giving a list of the first four steepest main road test hills in England as far as known?—A.H.D.

Four of the steepest hills in this country are: Sutton Bank, maximum gradient 1 in 3.96; Green How Hill, about 1 in 4 (both these are in Yorkshire); Birdlip, near Gloucester, about 1 in 5; Porlock, Somerset, 1 in 3.4.

The Use of a Release Valve.



Will you kindly answer these questions? (1.) What is a release valve for in crank case? Is it necessary? (2.) Is $\frac{1}{16}$in. too much clearance between exhaust and tappet? (3.) Can I start a 5 h.p. twin; free engine (on engine-shaft), magneto ignition, with a handle? If not, why?—L.A. 2435.

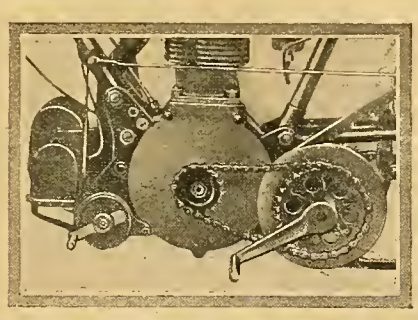
(1.) A release valve serves to get rid of compression in the crank case. Most of the pressure in the crank case is released so that oil is not blown through the bearings. (2.) Yes. The clearance should be about $\frac{1}{32}$in. (3.) It is very difficult to start a V-type twin with a handle on the engine-shaft, because unless the handle be geared up it is almost impossible to turn the engine fast enough to enable a motor cycle magneto to give a sufficiently strong spark to ignite the charge.

Magneto Timing.

Would you kindly inform me on the following points: (1.) The Bosch Co. say, when the piston is at the top dead centre of compression stroke, the distance between the trailing edge of the armature and the pole piece that it is leaving should be 5 mm. Where is the armature when the highest tension is generated, as I wish to make the points break at that particular point? (2.) I have been riding a Chater-Lea-Lagonda this season; now I have bought a new two-speed Humber. I gave the old machine in part payment. Can I use the same registration letter and number on my machine?—ANXIOUS.

(1.) You will not go far wrong if you set the magneto as pointed out to you by the Bosch Co. For information regarding the maximum position of the armature, which we presume you require to know, we refer you to "Motor Cycles and How to Manage Them," fourteenth edition, pages 57, 58, and 59. This book can be obtained from these offices, price 1s. 2d. post free. (2.) No, you would have to cancel the registration of your old machine, and, if you wish to retain your old number, ask leave to have this number allotted to your new machine.

St. Helens to Starbeck.



As an old reader of your paper, I shall be obliged if you will inform me the best way from here (St. Helens) to Starbeck (near Harrogate, Yorkshire). Kindly also give distance.—J.H.

Your best route would be as follows: St. Helens, Ormskirk, Preston, Clitheroe, Gisburn, Skipton, Ilkley, Otley, Harrogate, to Starbeck. The distance would be approximately eighty-two miles. The route we have given you avoids most of the big towns

Colchester to Bristol.

I have often seen details of cross-country routes given in your paper in answer to correspondents. I should be obliged if you could let me know if there is a road from here (Colchester) to Bristol avoiding London. I have done the journey through London several times, but it is not a ride that I should care to do at this time of the year.—LB 963.

Your best route would be as follows: Colchester, Braintree, Bishop Stortford, Ware, Hertford, Hatfield, St. Albans, Watford, Rickmansworth, Denham, Uxbridge, to Colnbrook, where you find yourself on the Bath Road. Then you continue through Maidenhead, Reading, Hungerford, Marlborough, Calne, Chippenham, to Bristol.

The Calthorpe two-speed countershaft gear, which is driven by a short chain, the final transmission being by belt, as shown. The gear wheels are always in mesh, and engagement is effected by means of internal expanding clutches brought into operation by a long lever at the side of the tank.

Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Two-speed Single and Sidecar.

(1.) I am purchasing a 1910 3½ h.p. Bradbury two-speed machine and am looking out for a sidecar for use with same. (2.) I should much prefer a coach built car similar to Messrs. Mead and Deakin's Canoelet sidecar. I am told, however, that this is too heavy for the machine and should be glad to know your opinion on the matter. (3.) I do not want to go in for a high-power machine, as the main use I shall have for it will be solo riding to and from business every day, and it will only be on comparatively rare occasions that I shall use the sidecar.—H.B.S.

(1.) With a two-speed motor bicycle you should be able to climb most hills, but of course, with a 3½ h.p., you have not much reserve of power. (2.) The Canoelet sidecar weighs 77 lbs., which is not at all excessive; 90 lbs. being not unusual. (3.) As you intend to use the machine chiefly for solo work, we feel sure you will be able to manage satisfactorily.

Choosing a New Machine.

(1.) Do you think the Arno 3½ h.p. fitted with a Sturmey-Archer three-speed gear, free engine, strong enough to take a Montgomery sidecar, driver, and passenger, combined weight 18 stones, up any hill round about Sheffield? (2.) Do you think the Arno method of fastening the engine to the frame reliable? (3.) Would you prefer a two or three-speed on this machine for the work for which I require it? (4.) Which start do you think is the best—pedal, handle, or kick? (5.) For changing gears which would you advise, foot change or handle-bar?—H.B.

We have a good opinion of the machine about which you specially enquire, and think it would suit your purpose. (1.) The machine should certainly be powerful enough to take a sidecar fitted with the three-speed gear mentioned. (2.) The method of attaching the engine to the frame is quite reliable. (3.) There is no doubt that the three-speed gear would be the more efficient, as the intermediate gear is of great advantage, but probably the two-speed would be slightly more substantial. (4.) The advantages of pedal or kick starting are that it is more certain, and no loose handle need be carried. (5.) It is merely a matter of what the rider is used to—some prefer the foot and some the hand. The Bowden gear has both methods. The Sturmey-Archer lever is on the top tube.

Burton-on-Trent to Portsmouth.

Will you kindly oblige by giving me the best routes from Burton-on-Trent to Portsmouth ?—P.L.C.

You will find the following routes suitable: Burton-on-Trent, Ashby-de-la-Zouch, Atherstone, and along Watling Street to the "Three Pots" Inn, then turn to the right through Wolvey to Coventry. In this way you avoid the miles of trams at Bedworth and beyond. On *viâ* Southam, Banbury, Oxford, Didcot, Abingdon, Newbury, Winchester, Bishop's Waltham, Fareham, Cosham, to Portsmouth. Return *viâ* Cosham, Petersfield, Greatham, Alton, Basingstoke, Aldermaston, follow Bath Road almost to Theale, where turn to left *viâ* Pangbourne, Streatley, Wallingford, Oxford, Banbury, Warwick, Kenilworth, Stonebridge, Coleshill, Lichfield, Alrewas, to Burton-on-Trent. The roads should be fairly good.

Registration for Short Periods.

My brother resides permanently in the South of France, and rides a Douglas. He is coming over to England for a holiday and bringing his motor with him for three weeks, and then returns to France. Which is the best road route to St. Malo from St. Jean d'Angely (which is in Charente Inférieure) ? I understand he does not carry a registration number in France at all. Must he register on the English system whilst over here, or would a simple "F" plate be in order ?—C.P.

The best route would be through Niort, Fontenay, Chantonnay, Montaign, Nantes, Bain, Rennes, and St. Malo. It would be worth while your brother becoming a touring member of the Auto Cycle Union. Unless he exhibits French registration numbers and an international plate, he will have to carry British numbers, pay registration fee of 5s., and the £1 local taxation licence.

Transfer of Numbers.

I have been reported for riding a machine with false numbers and for not having it registered. Herewith are full particulars of my case: In November, 1910, I took out a registration No. C 869 for a P. and M. machine. In May, 1911, I sold the machine on the condition that the purchaser should take out a fresh number, and I should retain my old number, as I was about to buy a more up-to-date P. and M. machine, which I did, and fixed my old No. C 869 on the second machine. Now what I want to know is whether I am right or wrong in doing as stated?—L.B.

The trouble seems to be due to the fact that you did not inform the authorities that you had sold the machine, and that they were to cancel the registration thereof. There is no question of selling the machine on condition that the purchaser should take out a fresh number. You are entitled by law to cancel the registration, and the purchaser has then no alternative but to take out a fresh number. If you then write to the authorities and ask leave to retain your old numbers they will probably agree to your request. We should recommend you to write to the superintendent, or chief constable, and tell him the facts of the case, and that you acted entirely in ignorance.

Horse-power of Twins.

(1.) The 60×76 J.A.P. twin engine is described by the Matchless Company as 3 h.p. and by the P.V. firm as 3½ h.p. Now if the former be correct it would be 1-11th more powerful than the Douglas 2¾ h.p. 60 × 60; if the latter be correct it would be 3-11ths more powerful. Now I wish to buy a twin that will be at least ¾ h.p. more than the Douglas, but I would not change for a paltry 1-11th. (2.) Could you give me the names of firms who supply 3½, 3¾, and 4 h.p. twins of good make? There is a remarkable absence of medium powered twins in the list recently published by you. (3.) Would the belt tension be the same for all positions of the back wheel while "springing" on the P.V.?—J.H.J.

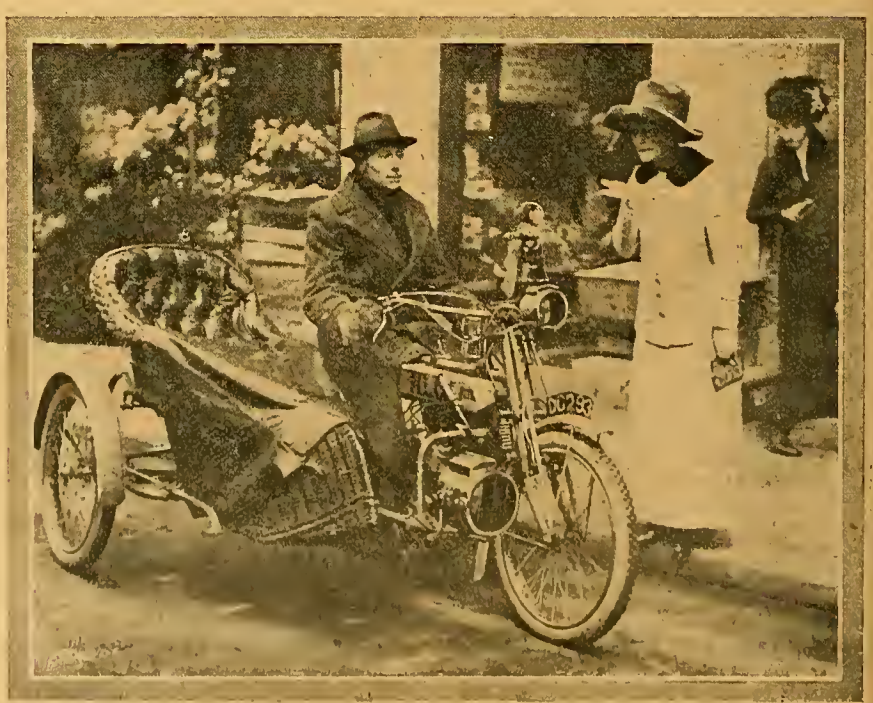
(1.) The nominal horse-power given by makers is not much guide unless the size is known. You may take it that the power of a motor cycle engine varies as the capacity. This is not absolutely true, as the compression ratio, number of revolutions, size of valves, etc., all have an influence on the matter, but as these do not vary very considerably they may be ignored without serious results. (2.) The J.A.P. engine you refer to is 430 c.c., Douglas, Humber, and Centaur 340 c.c., Enfield 343 c.c., Forward 344 c.c., N.S.U. 396 c.c., Wulfruna and Martin Racer 498 c.c., Scott 535 c.c., and Premier 548 c.c. So if we reckon the Douglas as 2¾ h.p., the J.A.P. would be nearly 3½ h.p.; as a matter of fact both engines give considerably more. Twins are generally made as lightweights under 350 c.c. or heavyweights 5 h.p. and upwards. (3.) The belt tension will vary slightly, but the variation will not be appreciable. The machine is most comfortable to ride.

Compression Increased by Longer Piston.

I should like to know if you can advise me on the following points. I have an old Minerva 2 h.p., 70 × 75 mm., a.o.i.v., which used to run very well until I had the cylinder reground and new pistons and rings fitted. The cylinder has a separate head, and when the head of cylinder is removed the piston appears for a quarter of an inch above the top of the cylinder. The timing and compression are right, and the carburetter which used to run it so well will only produce ten miles per hour. I cannot get any more or any less. I might say that the old piston came flush with top of cylinder. Would the new piston coming a quarter of an inch higher affect the engine to this extent ? as I am told it has altered the cubical capacity of engine.—D.A.P.

From what you say it is evident that a longer piston has been fitted. This does not alter the cubic capacity which depends upon the bore and stroke, but has considerably increased the compression ratio. This will seriously affect the running, and we should advise you to obtain a piston of the same length as the old one.

EXPERIENCES WANTED.



Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"C.M." (Perth).—2¼, 3, and 3½ h.p. Lincoln Elk. With and without sidecar.

"F.G.B." (Eastbourne).—7-9 h.p. Indian. Reliability and petrol consumption.

"D.J." (Portadown).—2¼ h.p. Lincoln-Elk. Reliability and hill-climbing. Also Shamrock-Gloria belts.

"E.C.S." (Worthing).—Triumph new foot control of ignition.

Miss Pauline Chase christening a new motor bicycle before proceeding to the Duke of York's Theatre to resume her part of Peter Pan. Miss Chase has played the *role* nearly a thousand times.

Comparisons are Odious—

but we **really feel compelled** to give you a packet this week. We are being **deluged with enquiries** week by week, since the Show, asking what we can allow on various machines in part payment for others, either new or second-hand. We note that some firms are offering the **most ridiculous prices** for old machines, in part payment for new or second-hand ones. The prices that they are offering are such as they really cannot afford to allow except by **deluding the customer.** Their system appears to be offering to allow big prices, **subject to approval**, and the **innocent customer** sends his machine up, expecting to get **this wonderful allowance**; instead of that, he gets a letter stating that they regretfully inform him that they cannot possibly make the allowance, as, now they have seen it, **it is not worth as much as they anticipated by some £10 or £15.** If, as has been the case in several instances that we know of, they decline their offer, then the prospective customer has **the carriage to pay back**, either to his own place, or to Hitchen's of Morecambe—**that is, to the man who does not offer any fancy prices**, but who names within a trifle of what he is actually prepared to allow, and who also offers this option, in the case of first-class machines, that if the deal cannot be put through, **the machine will be returned to you CARRIAGE PAID.** On the other hand, **they may allow their fancy offer to stand**, but you will find that what they allow more than the fair value of the Motor Cycle **is added twice over to the actual value of the Motor Cycle you are about to purchase**, so in the end you get done, as of course they don't allow you to return the Motor Cycle and **have your money back, as is the case with Hitchen's.**

Then again, you pick up the papers and read perhaps that one of these firms will send you anything you like, from a Sparking Plug to a Motor Cycle, on approval, on receipt of the cash, and from this you naturally conclude that if you don't like the machine, you are at liberty to send it back, and have your money back, as with Hitchen's, but, when you come to try it you find, to your sorrow, that it is not so, but that it simply means **they are only prepared to exchange it for another. They** have got your money, and you have to take what they like, and you keep on paying carriage time after time.

With Hitchen's, you have it straight from the shoulder week after week: if anything you get from us does not suit you, **return it within three days and HAVE YOUR MONEY BACK IN FULL.** If, however, you live so far off that it is impossible to send a machine back so as to arrive within three days, **we are prepared to extend the approval period to six days. We don't** ask you to send the machine back and exchange it for another, unless it is your wish to adopt this course, but we simply **send the money back IN FULL**, and you can then have a packet with some other firm.

ALL our machines are **guaranteed** to be in **perfect RUNNING ORDER**, as we keep expert mechanics on the job to make them so, if they are not in order when they come to us.

By the bye, we are contracting agents for P. & M.'s, Scotts, Zeniths, Eats, Matchless, Humber, Douglas, Clyno, Bradbury, Premier, A. C., Morgans; also can supply Rudge, Hobart, B.S.A., Triumphs, Enfield, A.S.L., and any other good machine on best of terms. Cash, deferred, and exchange.

We have several New Lists just come in from the printer. Send a postcard stating your wants, also ask for any advice you may want.

You cannot have forgotten the address—

Morecambe, Lancashire.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SEND DETAILS OF YOUR USED MOTOR CYCLE AND RECEIVE OUR LIBERAL CASH OFFER FOR SAME IN PART PAYMENT OF A NEW MACHINE.

WAUCHOPE'S

9, SHOE LANE, FLEET ST., LONDON, E.C.

'Phone: 5777 Holborn. Wires: "Opificer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or it "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

THE "EXPORT" MODEL MABON CLUTCH

converts your Triumph, Minerva, Rex, N.S.U., Fafnir, Peugeot, Brown, Kerry-Abingdon, F.N., Bradbury, Lincoln-Elk, Premier, and Norton, into a free engine model without difficulty. Fits engine shaft same as an ordinary pulley. Quite self contained, no levers to fix to crank case. Puts no end thrust on engine when driving or free. Handle-bar controlled. Perfectly reliable. Safe starting and driving on greasy roads, through traffic, and starting on hills without exertion. Overcomes the undignified running mount. The first multiple disc clutch for motor cycles, and still without a rival after five seasons. Thousands in use.

Of all dealers, price **£3 10s.**, or direct from—

This Year's Tourist Trophy Race.

IT is high time the course for the Tourist Trophy Race should be settled. Though several applications have been made to the Isle of Man authorities for permission to hold the race, no reply which will lead one to suppose that consent will be given by the Tynwald Court has been received up to the present. Time passes quickly, and those who intend to enter should know when and where this event will be held. Unfortunately, the Isle of Man cannot be altogether blamed for its hesitancy. A few of those who went over last year allowed their spirits to get the better of their discretion, and, we regret to say, by no means a good impression was made. Wherever the race is held, we sincerely hope that participants, their helpers, and spectators will be merry and wise, and let their "hosts" see that they can be happy and enthusiastic without giving way to any objectionable degree of hilarity.

Most people are of the opinion that the Isle of Man is the only place where British motor cyclists could hold a road race, and think that the race must be held in the British Isles. It certainly should be so, but if the Isle of Man does not give its consent at once, or if consent be definitely withheld, there is nothing to prevent the race being held in France, where permission could be obtained without the sanction of Parliament. French enthusiasm is displayed in a manner unknown over here; in fact, owing to the *entente cordiale*, the British riders would receive a right hearty welcome. The Auto Cycle Club de France would receive the idea with enthusiasm, as it could, without doubt, get the Government's permission merely for the asking, and the holding of the race would serve to forge another link in the chain which binds the two countries together in a stronger bond of friendship than has ever existed before. Hand-in-hand, the A.C.U. and the A.C.C.F. could organise a race which would be held on roads safer and faster than any we have in these islands, on a course preferably near Dieppe, which is really closer to London than the Isle of Man.

The cost to competitors would be no greater, perhaps even less, than if the event were held in the Isle of Man, while the fact that by holding the race in France friendly international rivalry would be promoted is not to be lost sight of. Fighting as they would on their own ground, the Frenchmen would have a better chance to compete with the British machines, and a more sporting contest would be promoted. To revert to the course. Those parts of France adjacent to Great Britain cannot offer a course as sporting or quite so good for testing the machines as that in the Isle of Man, but rather one which is a series of long, straight stretches, perhaps not altogether flat, but with easy gradients. At the turning points, however, the corners are likely to be acute, and British competitors would find that at corner work the Frenchman is unrivalled, as members of the N.W. London M.C.C. who raced near Lyons last year will remember.

Those members of the Manufacturers' Union who have agreed to sign a bond not to compete in a T.T. race in the Isle of Man would be under no obligation not to race in France; in fact, the suggestion to hold the race in France was made to us first by a trade member. We must say we think the suggestion worthy of most serious consideration, and, in any case, the location of the course should be decided upon at once.

The Choice of a Variable Gear.

By B. H DAVIES.

THE man who does not own a variably geared machine in 1912 will not infrequently feel that he is behind the times and out of date, though he will get his own back when he tackles a fairly straightforward piece of country and roars up everything at full r.p.m. or encounters a fellow motor cyclist in trouble with some detail of his gear. But, contrariwise, many a motor cyclist in riding his first variably geared mount will find food for reflection, and occasionally wish that he had invested in a different type of gear. The purpose of this article is to suggest certain principles which govern the wise selection of a variable gear.

Suitable Gearing.

The main principle is very simple. The lower the power of the engine, the greater the number of gear ratios with which it should be provided. Two road illustrations of this principle may suffice. Imagine a man who used a sidecar in 1911 with a single geared 3½ h.p. cycle. Remembering that last season he not infrequently had to shed his passenger, and that once or twice his cycle refused to pull the empty sidecar up rather exceptional hills, he invests in a two-speeded 3½ h.p. machine for 1912. Before next August he will often and ardently have longed for a three-speed, a four-speed, or an infinitely variable gear. Granting that he is much better off than he was in 1911, there are times when the iron enters into his soul. Owing to the extra weight of his outfit and the heavier build of his engine, he finds his new combination less lively and flexible on top gear than the old single geared set; and he resents the long, slow, noisy grinds on bottom gear up prolonged gradients of 1 in 12 or so. An intermediate gear would often have been welcome.

The Three-speed Mediumweight.

Or, again, consider the mediumweight man. He may choose between two or three speeds for his 2½-2¾ h.p. machine. Supposing that both machines are equally frictionless and reliable, the three-speed is ideally desirable. It provides him with a high top ratio, on which he may touch high road speeds with his engine turning over quietly and slowly, while it possesses a lower emergency ratio than the two-speed, and (if the machines are of equal quality) can therefore make more certain of ascending phenomenal hills. The two-speed medium weight requires an exceptionally well-balanced engine if it is to be comfortable and vibrationless at high speeds; an exceptionally efficient engine if it is to be capable of climbing everything. This particular question is at present complicated by the fact that one or two of the two-speeders have reached a higher stage of evolution than some of the three-speeders. In the near future the three-speeders in this class ought to take a lead.

Chain Drive.

The second principle is that a chain drive is probably preferable for all passenger work. The belt is cheap to replace, and easy to "fettle"; but, as "Ixion" points out, it is at its very weakest in the hour of its keenest trials. Set it to tug a heavy load up a bad hill in severe weather, and it may behave in heart-breaking fashion. The belt still claims the superiority for solo work, but is undoubtedly inferior for passenger use. Then, too, the chain does not slip in bad weather.

Type of Brake.

These principles dismissed, we may turn to details of less importance. For instance, it is not safe to take the efficiency of the brakes for granted on variably geared machines. When the back wheel is moved, as on some variably geared machines, the problem of ensuring the power of the main brake is complicated, and the designer's success in tackling this vital detail needs verification. When the rear belt rim is a separate entity, spoked apart from the wheel, similar precautions are advisable. The brakes of many chain-driven mounts are notoriously unsatisfactory within limits. A wire-operated tyre rim brake is less powerful than a belt rim brake, and is bound to occasion more trouble. A band brake may be excellent in the hands of a rider who will take the trouble to keep its band true and adjusted and its wearing surfaces free from glaze and charring; the rider must consider whether he is ready and able to observe these precautions, which are not so simple in fact as they are in theory. The dummy belt rim, provided solely for braking purposes, is in my view infinitely preferable. Bands glaze till they lose grip, and buckle till they rub on their drums and cause friction.

Chain Adjustment.

Again, with chain drive those patterns are preferable which possess a separate adjustment for each chain; and as such types become common the old type with two chains sharing a common adjustment is bound to become obsolete. Very fair success can be obtained with the old type by building up the longer of two sister chains in two sections, one of which contains exactly the same number of links as the shorter chain, and swopping the two at intervals. Flimsy miniature drawbolts on the back spindle, though satisfactory on push-bicycles, are a nuisance on motor cycles. They bend and strip their threads.

The Choice of a Variable Gear.—

I used up three pairs in two months on a 1911 mount. The newer gears, almost without exception, avoid this defect.

Accessibility of Rear Wheel.

Further, convenience of access to the rear wheel must not be forgotten, and this applies to certain free engine machines as well. It is probable that the hard rider will have to remove his back wheel several times in a year, either by the roadside or in hotel yards, in order to fit a new tube or cover. With some of the variable geared machines this is a long and awkward job; with others it is little less easy than on a T.T. single road racer. Such machines deserve preference.

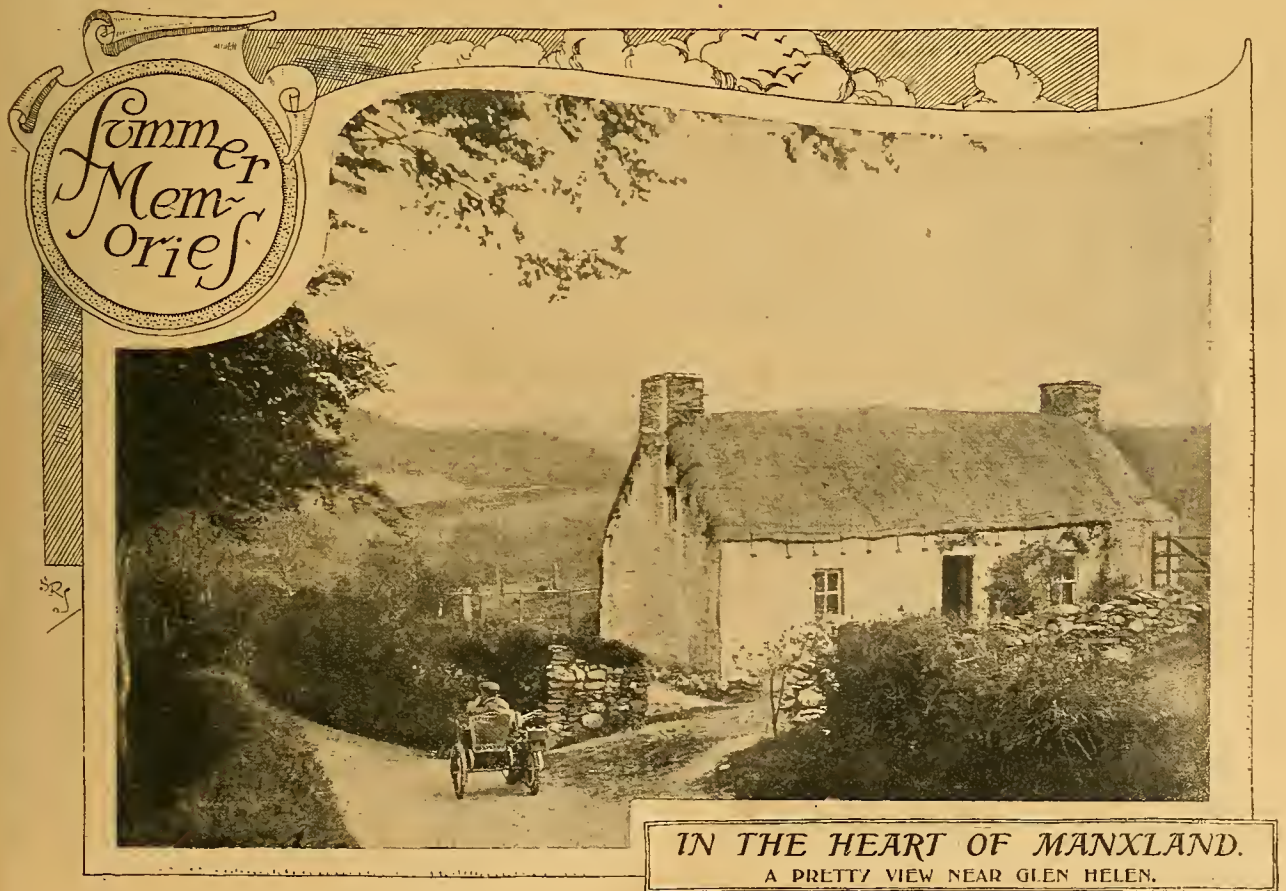
Still another point is the question of engine starting. Some gears necessitate jacking up the machine on the stand before the engine can be started with the pedals. The buyer has also the choice of hand starters and foot starters.

Finally, the real amateur duffer should plump for a machine with a really low emergency ratio, irrespective of whether he is buying a heavy roadster, a medium weight, or a sidecar outfit. It may seem ridiculous to insist on a bottom gear of 9 or 10 to 1, when the cracks accomplish sensational uphill flights on gears of 4 or 5 to 1. But the emergency gear has to cope with (1) a rider whose "tuning" abilities are zero; (2) possible ascents of freak hills like Barbrook, Farlow, or Amulree; (3) extremities of surface and weather. Before the season is over, the real duffer may taste the sensation of feeling anxious on a hill with his engine all out on a 9 or 10 gear. The conclusions described above may be tabulated as follows:

Gears and their Uses.

(a) Genuine 80 lb. lightweight.—As low a gear as possible.

(b) Medium weight for solo use.—Three-speed ideal; two-speed perhaps better evolved at present. Chain drive, or combined belt-cum-chain drive. (Complete belt drive spells a small engine pulley, and more likelihood of belt troubles.)



Medium weight for use with sidecar.—Not recommended.

(c) 3½ h.p. for solo use.—Two-speed with belt drive satisfactory.

3½ h.p. for sidecar work.—Three-speed, with chain drive, or belt-cum-chain drive, is ideal. In its absence, two-speed with chain drive is recommended.

(d) 5-8 h.p. solo use.—Single geared belt drive satisfactory. Two-speed with either belt or chain is luxurious.

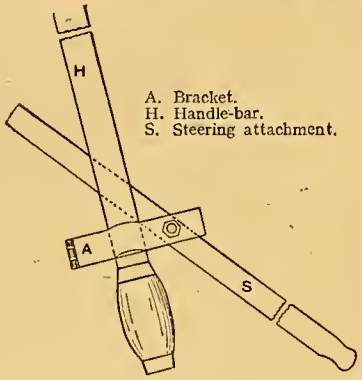
5-8 h.p. for sidecar work.—Two-speed with chain drive is entirely satisfactory. Belt drive not advised. Three or more speeds the height of luxury.

IN THE HEART OF MANXLAND.
A PRETTY VIEW NEAR GLEN HELEN.

CLEAN COUNTIES.

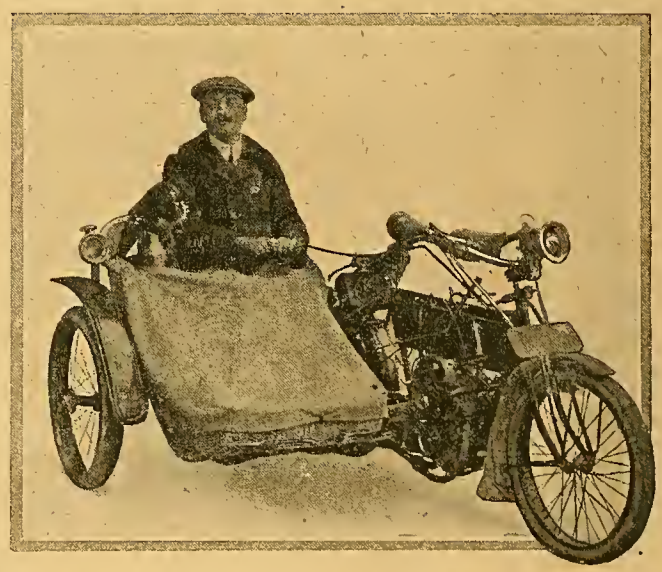
FOLLOWING on recent correspondence recommending readers to renew their licences in counties absolutely free from police persecution, we have pleasure in reproducing from *The Autocar* the following list, and would like to draw readers' attention to an editorial footnote to a communication in the "Letters to the Editor" columns this week, wherein is explained the method of allotting the licence fees to the Road Board and the counties in which the fees are collected. The following counties had no police traps in 1911:

Bedfordshire, Cambridgeshire, Dorset, Gloucestershire, Herefordshire, Leicestershire, Middlesex (Middlesex *Metropolitan* had twenty-seven), Norfolk, Northants, Northumberland, Oxford, Rutland, Suffolk, and Wiltshire.



It should not be forgotten that licences paid into post offices within the area of county boroughs are usually pooled by the borough and county authorities.

The registered number (fee 5s.) can also be obtained from any county or borough, and the only licence which *must* be procured in the town or county of residence is the driving licence (fee 5s.)



We should also like to make it clear that we should support the authorities in any prosecution for dangerous or reckless driving if sufficient separate evidence were forthcoming to prove it, our quarrel being only with the pernicious police trap, generally planned over tempting stretches of road where no danger is attached to speeds in excess of twenty miles an hour.

DRIVING FROM THE SIDECAR SEAT.

MR. OSCAR C. FRIED, of Rekawinkel, Austria, sends us some details of an attachment by means of which it is quite easy to drive from the sidecar seat, and, as he finds this more comfortable than riding in the saddle, he makes it his usual practice when he has no passenger. The attachment is very simple, and consists of a flat bar of iron, which is clamped to the steering column and to the handle-bar just in front of the handle grips. To this is attached the exhaust lifter, worked by a Bowden wire and lever. If the carburetter control be on the side to which the sidecar is fitted there is no need to move it. Mr. Fried has also fitted a long spring to the pedalling gear, with the object of keeping the pedals always in the same place for starting and braking purposes (his machine has a back pedalling brake). The attachment does not interfere with the ordinary use of the combination, as can be seen from the sketch, which shows the method of attachment to the handle-bar. The dog, we are informed, is entirely automatic in action, never failing to take his seat at the proper time.

H. Handle-bar.
S. Steering attachment.

Mr. Fried's Phänomen sidecar outfit.

On the last Thursday of February a new paper, dated March, will be issued by the publishers of *The Motor Cycle*. Its title, *The Arena*, when not supported by any opportunity for a perusal of its contents, cannot give an adequate idea of its scope. In this it will differ very materially from any existing publication, since it will specialise particularly on all matters likely to be of direct interest to past and present members of the great Public Schools and of the ancient Universities. These form, as a whole, a class which is possessed of immense loyalty and affection for the great institutions to which it is so much indebted, and consequently *The Arena* looks for support, not only of a merely casual interest in current events, but based upon a real desire to keep in mental touch with men and places which may be physically far removed. In addition to a staff composed entirely of Public School and University men, the new paper has enlisted the services of a number of expert contributors on matters of sport and outdoor life, while another of its many aspects will attract rather those who find pleasure in matters of tradition and history. The paper will be published monthly at the price of sixpence, and its illustrations —which will in the main be photographic—will be largely selected for their artistic merit, and will be reproduced as perfectly as possible on the highest quality of paper. If any of the readers of *The Motor Cycle*, many thousands of whom are themselves Public School or University men, would like to convey any suggestions to the Editor of *The Arena*, he can be found at 20, Tudor Street, London, E.C.

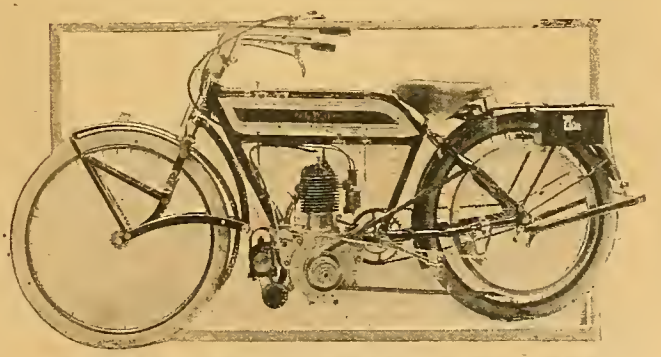
Cost of Running a Motor Cycle.

On the last day of the old year the *Sunday Chronicle* published some remarkable assertions on the subject of motor cycles; and as its contributor uses the same pen-name as myself, I should like emphatically to controvert most of his statements. Here are several quotations which show the general trend of his ideas:

1. "... *the man who can afford an initial outlay of £50, and an annual outlay at the rate of 10s. a week at least.*"
2. "... *a motor bicycle is a delightful toy.*"
3. "... *at least he should be in receipt of an income of £250 to £300 a year.*"
4. "... *I regard the pleasure (of motor cycling) as overrated.*"

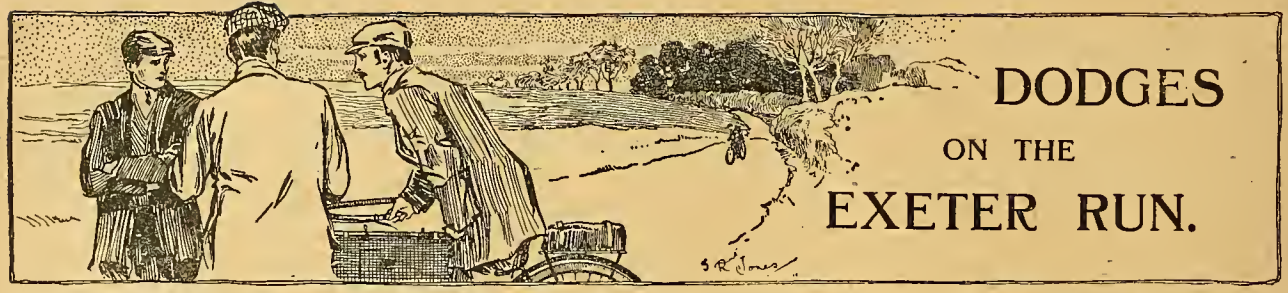
Every practical motor cyclist will understand at a glance why an individual who has spent £26 a year on upkeep should regard motor cycling as an overrated hobby. There are a few people about who are constitutionally unable to acquire that very slight mechanical ability which enables a man to do his own running repairs. Such a man has to take every tiny derangement to a garage, and if he bought a very third-rate machine, his annual expenses might be £26. I have never spent anything like £26 on the upkeep of one machine during a single season.

In 1903 I owned a rank bad machine, I was working too hard to do my own repairs, and I covered upwards of 6,000 miles; yet my bills totted up to less than £10 for the season. Of late years, since I have become qualified to do my own repairs, the upkeep charges have dwindled to the vanishing point, and like most clubmen, I could guarantee to ride any first grade machine 10,000 miles for less than £26; and 10,000 miles means at least two seasons' work for an average rider who does not use his machine for business purposes.



To call the motor bicycle a "toy" is a trifle ridiculous in days when thousands of business men prefer it to the train as a means of locomotion in the ordinary course of professional work. Only yesterday I was conversing with a knot of men who travel for a big colliery. Five of them have adopted the motor bicycle as an all-weather mount within the last two years. Each of these five claimed to be from £30 to £60 a year in pocket by the substitution. A large percentage of the manufacturers' orders come from men in middle life, who use motor cycles mainly for professional purposes, preferring them because of their convenience, comfort, economy, healthfulness, and reliability.

When we turn to the minimum income at which the ownership of a motor bicycle is advisable, we are on more controversial ground. The writer in question warns "working lads with 25s. or 30s. a week" not to contemplate purchase; and here I agree with him. If a Carnegie chose to present a thousand such lads with up-to-date machines, they could afford to run them. Such a youth can live on £1 a week, and the extra 5s. tots up to £13 per annum, which would easily cover the upkeep for 5,000 miles. But a lad in this position ought to be saving, and to spend the whole of his surplus income on a hobby is thriftless. Anybody who can afford £50 for a new machine and very much less for a good second-hand one, and can see his way clear to devote £10 per annum to upkeep, can afford to run a motor bicycle. This is regarding the matter purely as a question of finance. I admit that the expense may often be unjustifiable from other standpoints. In my opinion, a man who does not ride a motor bicycle, and admits having "chucked" it, should delegate the duty of writing about it to some person who does ride.



How to Prevent Side-slip.

The author of the interesting article in our issue of December 28th has omitted a few maxims which I consider vital. The chief safeguard is not to funk it. If you think you are likely to tumble, you *will* tumble. The second is to use a wide handle-bar; the more leverage the bars give, the better the prospects of correcting an incipient skid. The third is not to carry heavy weights on the tail of the machine; in some districts where the grease is particularly treacherous I find it considerably more difficult to keep a machine vertical when I have a big bag on the carrier, though, strangely enough, certain patterns I have ridden do not seem to mind added weight at the rear.

The point mentioned about keeping the saddle well forward is highly practical, but often entails using a special short handle-bar in winter. One machine which I recently owned was a terror on bad grease until I sawed about 6in. off each end of the handle-bar, and got a new saddle pin which brought my weight further forward. After these alterations it was very steady to ride, even in towns where grease abounds and there is a fair amount of traffic.

An Australian-built motor cycle—the E.W.B.-J.A.P.—quite an up-to-date design assembled and marketed by E. W. Brown, of Melbourne, Victoria. It will be noticed that Truffault spring forks are fitted.

DODGES ON THE EXETER RUN.

CONSIDERING the untoward nature of the circumstances—sloppy seas of mud underfoot and drizzling rain overhead—the intrepid-looking crowd of enthusiasts who were congregated under the flickering glare of acetylene flare lamps at the Bulstrode Hotel, Hounslow, on Boxing night, was a remarkably good natured and merry one. Most of them, too, were fairly busy. Here one would see hasty repairs, alterations or adjustments being made; or a protesting hand would be held out

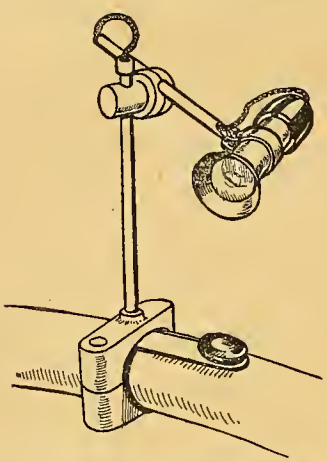


Fig. 1.—Home-made speedometer lamp on Bentley's Triumph.

to "ask your pardon, but my carburetter is somewhere down in that puddle, and I have not got a spare with me"; and in one dark corner, to the accompaniment of exasperated cursings, the entrails of a machine were being laid open to the elements.

Preparations in the Dark.

All around was the noise made by the use of spanners, the gurgle of emptying petrol cans, the buzz of conversation, and the slippity-slosh of dripping overalls. Men would be seen every now and then groping about in the dark with short-lived matches; others would devise means for tying something else on to a machine which was already a store of accessories and "bodgments"; anxious minds would carefully count their acetylene generators to see that none had dropped off in the ten mile run-out from town. Altogether a stirring scene of restless activity, glare, noise, and the smell of leaking acetylene gas.

And the machines themselves! A poor advertisement, I opine, for the motor cycle in general and an object lesson that one can hardly fail to regret could be taken advantage of by so few actual manufacturers of machines. True half a dozen hours of steady rain falling on mud-surfeited roads make riding conditions none of the best—and perhaps few of the machines were over-clean to start with—but only one description of them can be applied, and applied to one and all, they were absolutely filthy. From front number plate to back tyre, they were smothered with mud, it dripped—the more liquid parts of it—from lamp bracket, hubs, tanks, frames, engines, from everywhere that it could. Several of the machines really looked as if they had been dipped in a mud bath—and amongst them being some with specially fitted guards.

Penetrating Mud.

It is evident that mud takes a great deal more of exclusion than most people imagine. One thing, however, is rather remarkable. Here is a motor cycle trial which exceeds neither in distance nor in difficulty rides which are often undertaken under all sorts of weather conditions by ordinary amateurs who rarely trouble to make special provision as to weather-proofing and illuminating. Yet there was scarcely a machine entered for this competition that did not have some special fitting or other. Belt shields, extra mudguards, large tool cases, leg-guards, hand-muffs, monstrous lighting outfits—all these betrayed the fact that few riders or manufacturers have the courage to face four hundred miles of mud-plugging on standard machines. And there is yet another remarkable fact. Year after year the Exeter run produces machines with special devices, some of which are good, some bad, and some indifferent; some are fitted by amateurs, some by manufacturers, but all suffer from a common complaint—one seldom hears anything of any of the devices until the next Exeter run comes round again! Slipping belts are a bugbear, but a well-designed shield will overcome the trouble. So much is proved. Why then, one may ask, are these belt shields not fitted as standard to every machine which makes a pretence to being an "all-weather mount"?

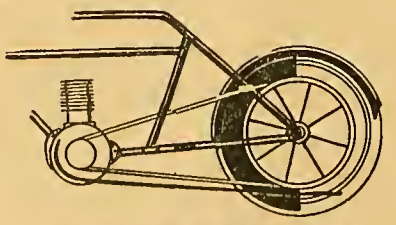

Fig. 2.—Mudguarding arrangement on 3½ h.p. Rover.

Interesting Fittings.

The following is a rough description of some of the more interesting devices which a stroll round the yard of the Bulstrode Hotel disclosed.

Fig. 1 shows a neat little turret-light contrivance fitted to his Triumph by P. H. Bentley. Although it was a home-made affair, the workmanship was irreproachable, and it formed quite one of the neatest little fittings imaginable. The electric lamp bulb is carried in a mounting which swivels in all possible directions, and which is carried on an extensible arm, which in turn is supported by a cross-head which can be slid up and down the central column. This last is carried by a special clip upon the handle-bar, wherefrom it is insulated by a packing washer of fibre. Both the column and the arm are hollow, the conducting flex being threaded through them. The switch consists of a blade similar to that which is used for magneto cut-out switches, and throws the lamp into circuit by earthing the column and clip to the handle-bar.

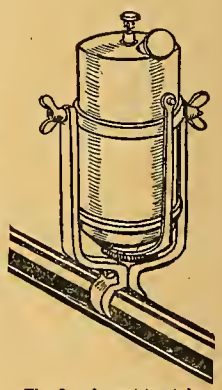

Fig. 3.—A neat top tube generator clip.

A Belt Shield.

Fig. 2 shows diagrammatically the arrangement which Harold B. Karslake had fitted to his 3½ h.p. three-speed Rover to keep mud off the belt. It was a shield of a very comprehensive nature indeed, and, to judge from the appearance of the belt after ten miles of the filthiest roads imaginable, was by way of being extremely effective. The principal point about it was the method of "filling-in" the back mudguard with a crescent of sheet metal, the edge of which lay *between* the tyre and the belt rim. This crescent extended exactly over the forward half of the wheel, and was riveted to the ordinary mudguard. At its bottom end the filling-in piece supported one end of a flat mudshield running underneath the belt to the crank chamber, where it was upswept over the engine pulley. The device closely follows the Dot method.

Another Karslake dodge is figured in the third sketch, and still another in the fourth. Both of these relate to the illumination, the first being a new genera-

Dodges on the Exeter Run.—

tor attachment and the second a novel arrangement of head lamps. As a means

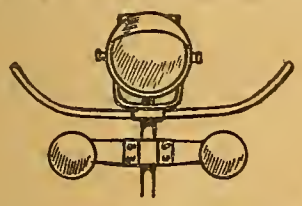

Fig. 4.—Novel lamp arrangement adopted by H. Karslake.

for clipping a generator to the top tube, Mr. Karslake's device strikes us as being quite the best thing we have seen, as it is at once so simple and strong, and supports its burden perfectly centrally. We understand it is shortly to be put upon the market by a firm of lamp manufacturers.

In the arrangement shown in fig. 4. the upper lamp is a large F.R.S. supported directly above the handle-bar stem by a plain bracket, which holds it centrally and extremely rigidly. The two smaller lamps are electric ones, which, although small, give a remarkably bright light. One of the great advantages of this arrangement will not escape the attention of riders who have gone in for several lamps at a time, namely, that the big acetylene lamp is fixed centrally above the steering head, and consequently has no bad effect on the steering.

Amongst several other provident ones was W. Cooper, whose Bradbury was fitted up with the device shown in fig. 5. Attached to the crank chamber was a V-shaped shield, as shown, of some breadth, which well protected the engine pulley and N.S.U. two-speed gear. In the point of simplicity, Mr. Cooper's device must be considered very effective indeed, although the greater part of the belt is not protected from mud splashed up from the road.

An Effective Underscreen.

T. W. Tattersall had provided his 5-6 h.p. R.A.G.S. with a monstrous undershield, designed to protect not only the belt but the whole of the rest of the machine, including the rider. It was a piece of sheet metal, almost eighteen inches wide, turned up in the front to form a wide rounded flap, and going backwards under the engine as far as the back tyre. It is rather surprising to find this sort of thing used so little, as it is extremely simple to make and fix, can be detached when necessary in a few minutes, and is beyond doubt extremely effective without any further additions. One of its great advantages, to the mind of one who happens to have tried such an undershield, is that it

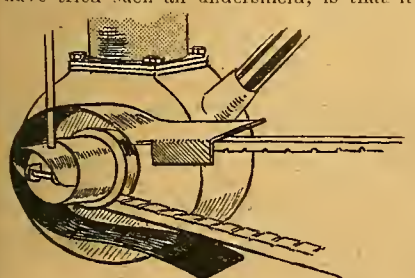

Fig. 5.—Engine pulley belt shield on W. Cooper's Bradbury.

keeps the legs and boots quite warm and dry—a very important consideration in winter riding.

The majority of additional mudguards that were to be seen had reference to the comfort of the rider rather than to the special protection of any mechanical part, thus one found most of them applied to the front wheel.

Fig. 6 shows the manner in which mudguarding of the front wheel was carried out on the Rudge machines. The arrangement was not particularly pretty, but appeared to be quite effective in screening the engine, etc., from mud. On each side of the ordinary guard are deep side flaps, which at the bottom terminate in a triangular horizontal flap, behind which again is a very large shovel-shaped leather flap trailing just clear of the ground. Fixed at each side to the blades of the spring forks is a convex panel, supported at its front edge only, and turned outwards at an angle of about 30°. It will be noted that this panel, or scoop, extends below the hub centre. Its purpose is to catch and deflect the mud and water, which is carried by the tyre past the front of the

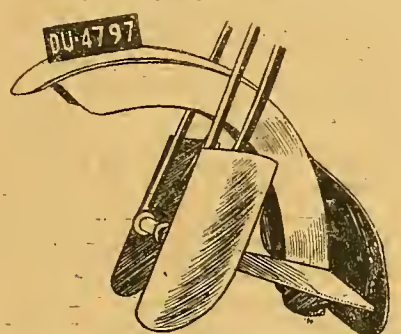

Fig. 6.—Special mudshields on Elce's Rudge.

main guard, and so blown back on to the legs of the rider and on to the engine.

Another machine with an unusual front guard was Geo. Wray's Bradbury sidecar, in which, as shown in the diagrammatic sketch, fig. 7, nearly a half of the front wheel was entirely enclosed by large leather flaps at each side, tightly laced on the ordinary mudguard.

Fig. 8 shows a home-made leg shield on a N.S.U. machine. Its construction should be obvious from the sketch. The down pieces were plain ordinary waterproof. Needless to say, there was a good show of Miller, College and E.L.I. shields.

The Question of Lamps.

Turning now to lighting arrangements, there were few riders indeed who contented themselves with a single head lamp. Many solo machines had two or three, whilst four on a sidecar combination was nothing out of the ordinary. In the matter of generators, there was no lack of quantity, the average number being three, although there were five on several mounts. One or two had provided themselves with dissolved acetylene outfits, the advantages of which system have only to be known to be appreciated. Electric lighting sets also found a good many adherents.

Several riders had forsaken purely motor cycle accessories for the more ambitious "car stuff"; indeed, it was almost the rule to find, at any rate on the bigger sidecar machines, a regular 60 h.p. head lamp. This, generally, was fitted up in a purely temporary manner, the usual place being on the front stay between the bicycle frame and the sidecar, though in a good many cases it was

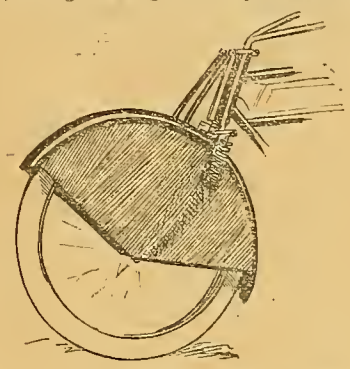

Fig. 7.—The large front guard on G. Wray's Bradbury.

fixed on the "toe" of the sidecar itself.

One of the few who had taken the trouble to "make a job of it" was W. Pratt, whose P. and M. carried a monstrous Lucas head lamp, carried as indicated in fig. 10. It was supported by a couple of massive columns proceeding direct from the front hub and braced to the ordinary lamp bracket. We understand the rider found this big and heavy lamp did not appreciate the bumps its unsprung position laid it open to; and the overhanging of so much weight did not make steering on greasy roads any too easy.

A Dynamo Set.

Probably the best lighted vehicle in the competition was F. B. Webber's Morgan runabout, which carried a complete C. A. Vandervell dynamo installation, the generator being driven by Whittle belt from a pulley fixed on to the outside flywheel of the engine. The lamps were a couple of C.A.V. car pattern ones, and gave an enormous light. Similar lamps, with special metal filament bulbs and silvered parabolic reflectors, were to be seen on two of the Rudges which were fitted with sidecars. In this case, the large battery of accumulators was carried in the sidecar, immediately behind the passenger's legs, whilst the 8in. head lamp was supported directly on the steering head, as shown in the small sketch (fig. 11), by a couple of brackets fixed to the handle-bar itself.

Route cards, speedometers, watches, etc., were generally lit by electric lamps,

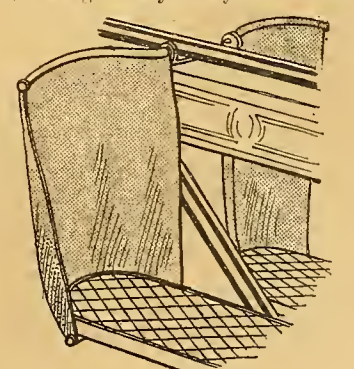

Fig. 8.—Leg shield on an N.S.U. machine.

Dodges on the Exeter Run.—

either fixed to the handle-bar or to the top tube. These lamps were, of course, intended for occasional use only, though, to judge from the battery capacity in some cases, they would outlast the night if kept hard on all the time. One man had gone the length of fitting up a full-sized electric side lamp on the handle-

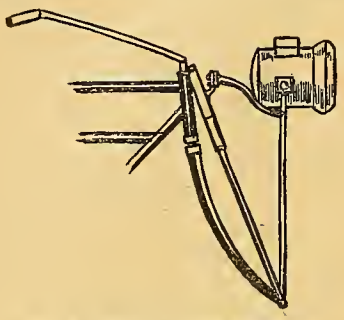

Fig. 10.—Special car lamp bracket on W. Pratt's P. and M.

bar in order to illuminate his route card. This excess of light is, however, in our opinion, a great mistake, as, unless one's head lights are of perfectly enormous power, the glare arising from the illumination of a route card or speedometer is likely to dazzle one at a moment when all the clearness of one's vision is wanted.

After seeing the lighting arrangements of most of the Exeter machines, we cannot fail to come to the following conclusions. They deserve, in our opinion, the closest possible attention, as they certainly appear to indicate that, as far as lamps and generators are concerned, there is room for a good deal of improvement.

Conclusions Arrived at.

1. Only a very few riders consider the light from even the largest motor cycle head light as sufficient for a long run. It was noticeable that the "old hands" had each a pair of head lights at least, almost without exception, or, if not, they had a motor car head light. In conversation with several well-known riders, we ascertained that they would willingly have carried as many as four head lamps if they could have done so safely or even found a place for their attachment, and this for no other reason than that something bigger and better than generally used at present is next to a necessity for a serious night ride.

2. Experienced riders have none too much confidence in even the best of acetylene generators, or else a couple would be considered ample for what is approximately twelve hours of darkness. It is quite evident that generators are not expected to operate for the time for which their makers claim them to produce gas. With regard to electric batteries, it is here not so much a slight lack of confidence that is manifest, but a go wrong, which can only be taken to positive expectation that they would mean that the average motor cyclist is of the opinion that accumulators have in no way improved since the days of the battery ignited machine. Partially, perhaps, this may be due to the fact that in many cases special accessories are fitted for the Exeter run only at the last moment, and that this test is the first occasion for their use over a prolonged time. It is all very well to be on the safe side—that,

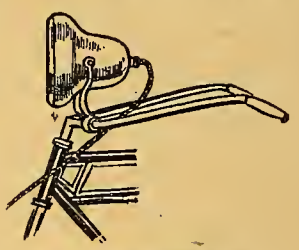

Fig. 11.—C.A.V. lamp arrangement on Elce's Rudge.

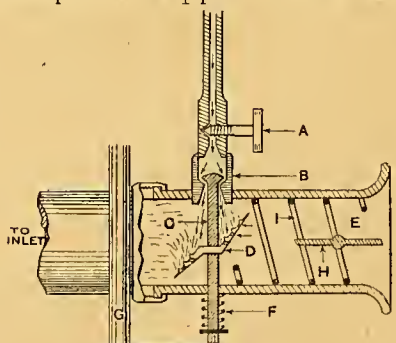
after all, is the merest prudence—but there is no reason that we can see why lamps and generators should not be at least as adequate for their work and as reliable as any other part of a motor cycle. No one, that we could see, was carrying spare magnetos or carburetters! Be it noted, also, that no one taking a car through such an event would festoon it with spare lamps and generators, the standard outfit being capable of doing all that is required of it.

A MECHANICAL VAPORISER.



MANY and various are the designs of carburetters and methods of vaporising that we read of or see from time to time, yet never have I seen or heard of experiments in the same trend as contained in the following lines. This experiment was carried out by the writer during 1906 when endeavouring to obtain the last ounce of power from an old automatic inlet single that was used for racing purposes.

No other field of motordom has such scope for experimental work as carburation. Those whose inclinations have been in this direction well know the reward.

The arrangement here described was used entirely for speed work, and at no time did I test it for touring purposes. It was rather extravagant in spirit, but this was only a minor detail in my case, hence economy received little consideration.

Benzine was the fuel always employed, but an incident which proved the vaporiser was up to its duty with kerosene is here related. I had completed my preliminaries, some six or seven laps, and a few minutes prior to the start handed the machine to the attendant, who filled the tank. This completed, I got on the mark, and was somewhat perplexed, when the gun went, to find the machine, usually fast at kicking off, just the reverse, and it was with difficulty I got a move on. However, when once going it fired splendidly right throughout the race. After examination revealed the fact that kerosene had been placed in the tank, whether deliberately or otherwise will never be known, but many such shady practices were in evidence in this country then. [This does not refer to England.—Ed.]

The accompanying sketch clearly shows the working of this vaporiser. The tank was made of brass, capacity about one quart, while the filler cap contained an ordinary Dunlop air valve taken from a cycle inner tube. After partially filling the tank, pressure was applied per medium of a cycle pump connected to the Dunlop valve. A pipe led from the tank

The mechanical vaporiser described in the accompanying article.

cock to a needle valve A, which acted as a jet. B is a valve seating attached to the jet, while C is a small valve. Fastened to the valve stem of C is a Z-shaped collar D, ridged and drilled with 1/16in. holes, which break the spirit up. The above was attached to the inlet pipe E, which faced to the front of the machine.

The valve C protruded through the inlet pipe, where the spring F was placed to seat it firmly. Now from the exhaust cam an extension was carried, and on this was attached another cam, which worked the rod G, similar to the present overhead mechanical valve. This was timed to open the valve C just prior to the induction stroke, and to close it on its completion.

The pipe E was closed at its extreme end by the air throttle H, worked by a lever from the tank. A piece of wire I, in spiral form, to act as a quick thread, which gave the incoming air a revolving motion, was soldered inside the inlet pipe.

It will be readily seen that, on the induction stroke, the valve C being open, the spirit, with pressure behind it, strikes the collar D with some force and is converted into very fine spray. The air entering through the inlet *vid* the throttle H meets the spirit at this collar also, and, while assisting in vaporising the fuel through the holes in D, is at the same time thoroughly mixed with it.

No throttle for governing the gas was fitted, it being unnecessary for racing purposes, the control being entirely by the air and the ignition.

This vaporiser, when used with the automatic valve, could not be cured of popping, which eventually led to the inlet valve being converted to a mechanical overhead, when the trouble disappeared.

The advantages of this style of vaporiser are many. The choked jet trouble is non-existent, a thorough mixture is obtained, which is forced into the cylinder by the pressure of the inrushing air, hence the latter is charged with gas to its utmost capacity. S.L.B.

M.C.C WINTER RUN TO EXETER AND BACK.

COMPETITORS' EXPERIENCES.

MY entry being the first received by E. B. Dickson, the trial hon. sec. for this event, I had the advantage of starting first for motor cycles. Sharp at seven o'clock I was given the word to go by Timekeeper F. T. Bidlake and R. H. Head, the chairman of the club. The first few miles required great care over the tramlines, and W. H. Wells with his big 7 h.p. Indian sidecar, came past me going great guns. I certainly tried to overtake him, but owing to the bad state of the roads through Bagshot and Egham, was quite unable to do so. Egham Hill was being observed by F. J. Jenkins, and he informed me later that no fewer than thirty-seven failed here. No doubt many of them were new to night driving. Surely the old hands would never fail so hopelessly. Soon after we had passed Blackwater I was joined by V. Olsson on his new twin Trump-Jap, he having taken delivery of the machine two days previous to the run. It was certainly one of the quietest machines in the trial, and always had a good turn of speed.

Several of the men were complaining about having lamp trouble, but I was one of the fortunates this time, having fitted one of the Lucas lamps with two separate generators, and also an electric lamp and dry battery.

Just before reaching Andover I noticed Jack Woodhouse and his back tyre having a few words together.

I arrived at Salisbury, the first checking place, at 10.50, and all were quite ready for their first "breakfast." Several of the machines could not be taken into the hotel yard, and had to be left in the road while the riders refreshed the inner man.

The Course Well Marked.

W. H. Wells and I left Salisbury in the second stage of the journey, and I kept a very sharp eye for the turning at Wilton, this being the place where so many of us went wrong last year, but, thanks to the trials secretary, the course was very well marked with lanterns at the back of the arrows, and no one need to have gone wrong.

The narrow roads and lanes beyond Shaftesbury were in a deplorable state, and floods were met which caused my belt to slip in taking the splash, and, in fact, I saw two cars skidding all over the road.

Yeovil saw a good number of the men taking in supplies.

Chard was the next stumbling block for the majority of the riders. Mather and I struck the hill together, but, unfortunately for him, he fizzled out, whilst I slipped in my low gear and sailed comfortably to the top. I was much surprised to see such a large gathering of spectators so early in the morning, and yet a section of the trade say they do not want competitions. It is a pity they do not go through some of these trials and witness the enthusiasm all along the line.

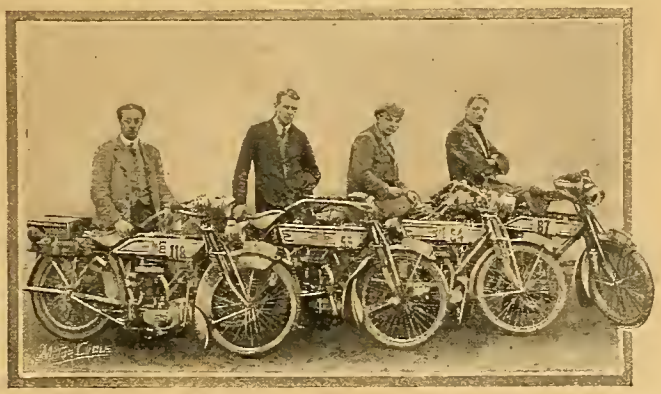
Alan Hill told me he failed first time with his Rudge and sidecar, but went down again and made a clean ascent; in fact, I quite believe fifty per cent. failed owing to their striking the hill unawares in the dark.

At Yarcombe I waited at the top to witness several of the climbs, and the best I saw was by W. A. Sale (7 h.p. Indian), who came up at a great speed, and V. Olsson (Trump Jap), also Harry Bashall with Enfield sidecar.

The weather now had become very bright and riding conditions were much better. One thing I am quite sure about, had we known the roads were in such a dreadful condition when riding over them in the dark, we should not have taken such risks. However, "All's well that ends well."

The first return check was about one mile from Yeovil, and I felt convinced several would be disqualified for being too early.

I was not due before 10.25, but I noticed some of the back-markers had signed in at 10.8.



The floods were still out, which caused the belt-driven machines much trouble. A good many people witnessed the ascent of Shaftesbury. Bell (F.N.) and Hull (Indian sidecar) led the field as far as Basingstoke, where Southcombe-May was in charge of the second check, which caught several of the riders napping.

At Bagshot I caught up Bell lighting his lamp. We both were very anxious to be the first to finish, so I took the risk over grease and mud and checked in first at the finish at 5.43, having gone through the most arduous and trying trial that I ever remember, my machine—a Bradbury—never giving me a moment's trouble, except the petrol pipe, which somehow got choked. The tyres—R.O.M.—did their work remarkably well considering the nature of the roads, and held up splendidly.

W. COOPER.

Experiences of the Competitor using the Smallest Engine.

When I left home on Tuesday afternoon it was raining hard, and my belt was slipping very badly. On arrival at Hounslow I found that nearly all the competitors were there busily engaged putting finishing touches to their machines. Just prior to leaving, I heard that A. V. Sumner had been unfortunate enough to break the axle of his S.A. three-speed gear. At 7.57 p.m. I was despatched with F. L. Goodacre (A.S.L.), rain falling slightly. We kept company until Basingstoke was reached, where we found several competitors who had stopped for a smoke and something to eat. G. N. Higgs (A.C. Sociable) supplied us with hot coffee from his Thermos flask, and S. B. White (4 h.p. Service) with some beef tablets, both of which were thoroughly appreciated. Finding that my exhaust valve had lengthened, I filed a piece off at the garage. In the middle of Salisbury Plain I found H. A. Cooper (Bradbury) and R. Croucher (3½ h.p. Kerry and empty sidecar) with sandwiches and hot Bovril. As time was getting on, I restarted only to be stopped very soon by Frank Thomas and O. Hill (G.O.K. sidecar) for some petrol, as they had run out, so we turned the little Alcyon over, and got some out *via* the filler cap. Then my troubles started. About one mile after leaving Thomas, the exhaust valve broke, and all my spares were too long. I here discovered that I had, among other things, lost my file, so there was nothing else to do but take off my belt and pedal. Thank goodness, not very far off I found a signal box, so went up the railway bank and knocked at

The team of Ariel riders in the 1911 M.C.C. London-Exeter-London Run. F. C. North, G. Boswell, C. B. Duberly, and S. C. Perryman. All four succeeded in gaining gold medals.

Competitors' Experiences in the M.C.C. Winter Run.—

the door. After a little searching round, the old signalman found what I wanted, and I was enabled to file a little off a valve and proceed into Salisbury. Here I found C. F. Halsall (Clyno) just getting ready to leave. Having filled up with petrol, oil, carbide, etc., I was just about to enter the hotel when H. Foote (8 h.p. T.T. Bat) arrived, having had trouble with his front tyre. I was now something like two and a half hours late, so we pushed on together.

We were travelling together at a very reasonable speed, when Foote hit a water splash, but, luckily, did not stop in the middle. After examining this for depth, I decided to risk it, so took it "all out." We then, of course, found our belts slipping, so stopped and applied some more "Belticum," which immediately stopped the slip. I had applied some of this stuff before leaving Hounslow, and I must say it is nothing short of marvellous on either a rubber or leather belt for stopping slip. A few hundred yards further on we came across another water splash, so took it "all out" again, Here we passed Halsall going very slowly, and with his engine transmission making a terrible noise. Yeovil was our next stop, where we filled up with petrol, etc., and the garage proprietor very kindly supplied us with hot coffee, etc., the Mermaid Hotel being closed.

Chard Hill.

I managed to get nearly to the top of the steep pitch, and feel sure I could have climbed to the top could I have pedalled, but, as mentioned earlier, I was minus a chain. After pushing the machine up to the cottage, I managed to get going again, and flew to the top. I was very worried again over Yarcombe Hill, but was agreeably surprised to find that I was able to get round the first two or three bends; then Foote pushed me a few yards now and again till I reached the top. About fifteen miles out of Exeter I was stopped by J. Chater-Lea (Chater-Lea sidecar), who had broken the spring of his contact-breaker, so after leaving him a new contact-breaker complete I pushed on into Exeter. Having left Salisbury so late, I had no time for food, and had immediately to turn round and come back. At Yeovil we were feeling pretty bad, not having had anything to eat since leaving Salisbury, and plenty of work to do. While Foote ordered some drinks, I saw that the machines were filled up with petrol, and bought some buns. The next stop was for oil, as I had been giving my little engine plenty. On Shaftesbury Hill Foote again helped me to the top by means of a few pushes on the shoulder. I must repeat that I am sure it would have been quite possible for me to have climbed all the hills had I been able to give a little pedal assistance. Then on to Salisbury, where we had a meal which we thoroughly enjoyed, being almost starving.

Just outside Salisbury I took the wrong road, but only for a few hundred yards, when I discovered my mistake. Nothing happened after this until I arrived back in Hounslow nine minutes inside twenty-four hours.

With the N.W. Londoners to Gloucester.

On Christmas morning I fetched my 3½ h.p. clutch Singer from Euston Station, and, never having been on a machine of this make before, I was very anxious to try it. I rode the machine straight home, and did not get a chance to try it again till Friday, when I had a short run round, and then went up to Hampstead in the evening, to be on the spot for the start to Gloucester. After trying many places, we (H. Foote and myself) eventually arranged to sleep on a sofa at the Bull and Bush Hotel, all the beds being engaged. Here we found Montague Drew, who had knocked the silencer off his 3½ h.p. 1912 Zenith.

Coffee Tin Silencer.

As the rules of the competition stated that noisy machines would be disqualified, we fixed up a coffee-tin to act as silencer. It was not till 3 a.m. that we had finished this, together with sundry adjustments to our own machines. The coffee-tin silencer was a great success, and held together during the run to Gloucester and back. We then retired to our "beds," only to rise again at 5.15. At 7.15 the first man was despatched. The road from "Jack Straw's Castle" was somewhat twisty, but very well arrowed; only once did I, in company with G. Fletcher Douglas) nearly take the wrong road. Luckily, Fletcher saw our mistake just in time. I had not been able to test the Singer's hill-climbing capabilities, and was really astonished at the way it literally flew up Dashwood with cut-out closed and nothing like full throttle.

The Writer Helps a Stranded Competitor.

About fourteen miles from Oxford one of my lamp-bracket bolts broke, and I was therefore obliged to carry lamp and bracket in one hand and steer with the other. I was somewhat late, and it was not a very nice experience, riding fast with only one hand, on a greasy road. Just outside Oxford Dickens was stopped, having run short of petrol. After giving him a couple of horn bulbs full, I proceeded to Morris's Garage. The run into Gloucester was uneventful, excepting the tramlines, which were in a terrible condition for skidding.

The most interesting part of the return journey was the ascent of Birdlip, with its long gradual gradient and then a corner, which is fairly stiff for a hot engine with cut-out closed. The Singer, however, came up here without a falter. Then for a few miles we ran through a fog.

It was now getting dark and I was lampless! However, I managed to buy an ordinary bicycle oil lamp, and with this I got into Oxford. Here, at Morris's Garage, I borrowed a very ancient Autoclipse head light.

There was a big crowd waiting in High Wycombe to see the competitors climb the fairly stiff and greasy hill leading out to Stanmore. A few miles on, I passed Griffiths on his little Alcyon, who had been delayed owing to belt troubles. After giving him a spare belt-fastenr link, I pushed on as time was fleeting. All went well till the Bull and Bush was reached, when I discovered that I was two minutes ahead of time. I decided to allow myself half a minute to get to Jack Straw's Castle. This, I found to my sorrow, was not quite long enough, as I was twenty seconds outside my maximum time.

The Runs Compared.

There is really no comparison between the two runs. Whereas in the first competitors had to climb Chard and Yarcombe in the dark, in the last, Dashwood and Birdlip were ascended in daylight, which is quite another matter. The roads to Exeter were in a far worse condition than those to Gloucester, and, coupled with the bad roads, a lightweight is very hard to get through without even any pedalling gear. I would suggest next year the competitors should all have to make a non-stop from Gloucester to the top of Birdlip.

R. G. MUNDY

R. O. Clark (four-cylinder F.N. and sidecar), one of the successful competitors in the M.C.C. Exeter run. On all hands one heard expressions of approval concerning the silence of this machine.

London to Gloucester and Back.

BELOW will be found the results of the N.W. London M.C.C. twelve-hour trial to Gloucester, on Saturday, December 30th, subject to confirmation by the committee:

SPECIAL PRIZE (solo machines).

W. Cooper (3½ Bradbury)

SPECIAL PRIZE (passenger machines).

F. W. Applebee (3¾ Scott sc.)

SILVER CUP WINNERS.

(Lost less than 30 marks.)

Glynn Rowden (3½ Triumph)
A. E. Woodman (2¾ Humber)
E. Pond (3½ Singer)
W. Cooper (3½ Bradbury)
W. Oldman (6 Bat and sc.)
H. C. Mills (3½ Premier)
R. Scott (3½ Triumph)
C. M. Simpson (7 Indian)
C. J. Burton (10-12 Mors)
A. E. Hawkins (2½ A.J.S.)
H. H. Berlandina (3½ P. and M.)
F. W. Applebee (3¾ Scott sc.)
J. Beal (3½ N.S.U.)
Eric Rose (3½ Triumph)
E. F. Lawrence (3½ Rudge)
J. W. Thomas (2¾ Douglas)
M Morgan (8 Morgan Runabout)
R. Lord (6 Rex Sidette)
J. A. Hilger (3½ Premier)
R. L. Printz (5 Bat)
H. Bean (5 Matchless)
A S. Phillips (7 V.S. and sc.)
W. C. Knight (3½ Triumph)
A. O. Rivon (16 Argyll)
P. H. Goddard (2¾ Douglas)
Gordon Fletcher (2¾ Douglas)
G. S. Drew (6 Zenith)
M. Drew (3½ Zenith)
L. S. Guiver (3½ Rudge)
R. G. Mundy (3½ Singer)
A. F. Plint (2½ Stuart)
Hal Foote (8 Bat)
A. V. Deacock (6 N.S.U. and sc.)
R. Holloway (3¾ Premier Twin)

SILVER MEDALS.

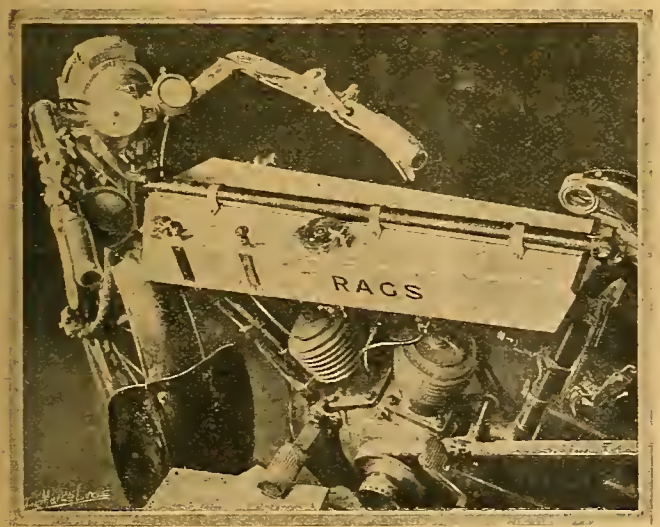
(Lost less than 40 marks.)

O. Tustin (2¾ Enfield)
W. Jacobs (3½ Rex)
Frank Smith (5·6 Clyno sc.)

BRONZE MEDALS.

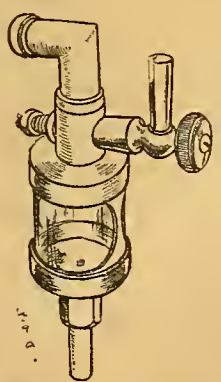
(Lost less than 60 marks.)

G. Griffiths (2½ Alcyon)
L. Cass (3½ Quadrant)
A. G. Peppercorn (3½ Bradbury)



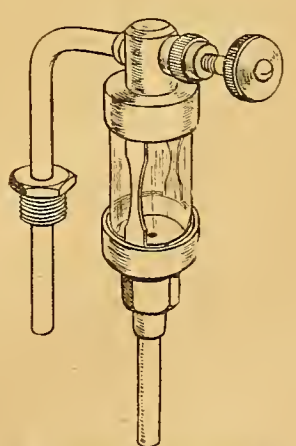
We have been asked to point out that several competitors lost all their marks through making adjustments in the control at Gloucester—a contravention of the rules.

W. Tormey, the Sydney motor cyclist who recently lowered the motor cycle record between Melbourne and Sydney (Australia). During the journey he was charged by a cow, which afterwards rolled over him. The existing time was 48 hrs. 40 mins., which Tormey improved upon by 4 hrs. 37 min. His mount is a 3½ h.p. Kerry-Abingdon.



A TAPERED TANK.

MR. A. C. DAVISON, the well-known manufacturer of tanks and other motor cycle adjuncts, has, in response to a demand for a tank of larger capacity than usual, brought out one which holds slightly over two gallons, and yet is not abnormally wide in that portion where width would be an inconvenience. The tank is pointed at the front, wide at its foremost end, and then gracefully tapers away. The width at the widest point is 7in., and at the narrowest 5½in. When mounted on the frame it has quite a neat appearance, while the advantage of carrying two gallons cannot be overestimated.



A special tapered two-gallon tank with binged stoppers made by A. C. Davison.

NEW LUBRICATORS.

Davison's positive drip-feed.

A new automatic drip-feed lubricator.

Other novelties of Mr. Davison's production are a 1¾in. hinged stopper, which is of a most convenient size and two new drip feeds (see sketches) one working by suction and the other by gravity.

CURRENT CHAT

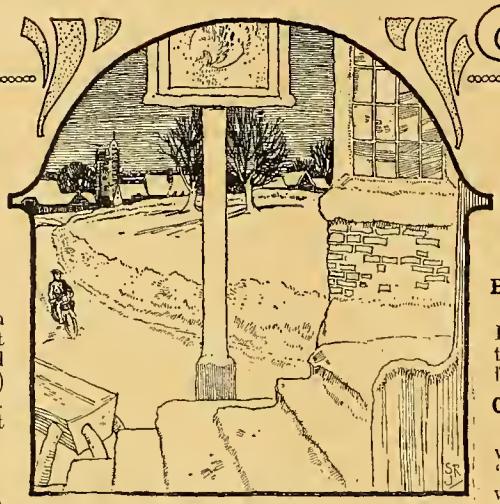
Birmingham to York and Back.

At a meeting of the Birmingham M.C.C. committee on Wednesday last week it was decided to award a gold medal to V. Busby (2¾ h.p. twin Humber) who finished second to F. A. Mc.Nab. The twin Humber was the smallest machine in this difficult trial.

The Year's Motor Cycle Records.

For hanging up in the office, we have had the list of British motor cycle records which appeared in our issue of November 30th, mounted on cardboard. Readers who would like a copy for reference pnrpeses should apply to *The Motor Cycle* offices, 20, Tudor Street, E.C., enclosing 2d. in stamps to defray postage.

French Winter Trial.



The Marseilles M.C. will hold a motor cycle competition on February 18th, which will include a hill-climb and a speed trial on the flat. The climb will be on La Cède, a hill with a maximum gradient of 1 in 8. The results will be decided on formula, and no change of gear will be allowed in the hill-climb and speed tests. A number of prizes are offered, and further particulars may be obtained from the secretary, 14, cours Belzunce, Marseilles.

M.C.C. de France Annual Reunion.

The Motor Cycle Club de France assembled on Saturday evening last to distribute the prizes won in the recent Circuit de Melun, and to participate in a banquet. Many representatives of the sport and industry were in evidence, among them visitors from the Motor Cycle Cln' de Paris. During the evening an announcement was made that the M.C.C. de France and the M.C.C. de Paris would shortly be amalgamated, the former to absorb the latter. The remainder of the evening was devoted to a lantern lecture on the beauties of the Meuse and Rhone Valleys.

A.C.U. Annual Dinner.

The annual dinner of the Auto Cycle Union will be held at the Waldorf Hotel, Aldwych, W.C., on Saturday, 20th January, at 6.30 for 7 o'clock, when Mr. Robert Todd, the chairman of the Union, will preside. As usual a most interesting musical programme, at which several well-known artistes will appear, will follow the dinner. For the convenience of those clubs which are making up parties to attend the dinner, seating accommodation will be arranged so that friends may sit together. Ladies are invited to be present. The price of the ticket is 7s. 6d., and may be obtained upon application to the secretary, Auto Cycle Union, 89, Pall Mall, London, S.W.

Australian 24 Hours' Record.

Until recently the twenty-four hours' motor cycle record was held by H. B. James, who covered a distance of 460 miles on Western district roads. P. J. O'Brien (riding a 1909 3½ h.p. Triumph) has improved upon this mileage. Starting at 4.5 a.m., O'Brien rode for 23h. 50m., in which time he covered 504 miles. His ride was not without incident. The petrol tank was punctured by a stone being thrown up, and the wire control to the exhaust valve lifter broke, thus necessitating the opening and shutting of the compression tap by hand. The roads on the whole were very bad, there being in places bad, sandy patches 6in. deep, which, of course, caused very slow going. The route taken was through Essendon, Woodend, Lancefield, and Carlsrnhe. O'Brien had one bad fall during the night on Battlepork's Hill, and, owing to his lamps failing, the trips through the Black Forest necessitated cautious riding.

P. J. O'Brien, an Australian motor cyclist, who recently lowered the Australian twenty-four hours record, covering a distance of 504 miles in that period. He rode a Triumph.

SPECIAL FEATURES.

CHOICE OF A VARIABLE GEAR.

FEATURES OF 1912 AMERICAN MOTOR CYCLES.

THE YEAR'S IMPORTS AND EXPORTS.

Birmingham M.C.C. Passenger Trial.

Mr. Herbert Austin, president of the Birmingham M.C.C., has offered a cup for that club's passenger trial, which we referred to last week.

Cost of Running.

We are obliged to hold over until next week further letters on the subject of "Cost of Running a Motor Cycle," which feature has now been running in these columns for several weeks.

A Protest.

We have received a copy of a letter written by J. J. Woodgate to the Auto Cycle Union protesting against the awards in the recent Sutton Coldfield A.C. two-day reliability trial. Mr. Woodgate contends that certain competitors placed in front of him transgressed the rules, whereas he made a non-stop run.

Ninety-two Motor Cycles in Two Years.

It is extremely likely that the record —if there is such a thing—of riding the largest number of motor cycles in a year belongs to a member of the staff of *The Motor Cycle*. The rider in question sampled no less than forty-five different motor cycles and five cars during last year, the total for 1910 being forty-two, *i.e.*, ninety-two in two years. The average distance ridden on each machine was about fifty miles, the experience of some extending to several thousand miles.

A Reader's View of the Exeter Run.

A correspondent has compiled from our columns the following list of 100% successes in the M.C.C. winter run, and sends it to us with the following remarks: "It would appear there was a gold medal for every competitor except the very unfortunate, and that the entry fee was sufficient to buy a gold medal and leave something towards the expenses from each competitor."

Douglas ...	7	entered	7	gold medals
Bradbury ...	6	,,	6	,,
Bat ...	5	,,	5	,,
Triumph ...	5	,,	5	,,
Rover ...	4	,,	4	,,
Ariel ...	4	,,	4	,,
Chater-Lea	4	,,	4	,,
New Hudson	2	,,	2	,,
Arno ...	2	,,	2	,,

Then follows a list of single successes.

Affairs in the States.

An account of an interview with Mr. George M. Hendee appears in an American contemporary. Mr. Hendee tells some interesting facts about his great business. 15,000 machines are to be made, and all are to be delivered before July 1st. The output since January 1st is one hundred machines per diem—an average of one machine every five and a half minutes.

An Easy Record.

During 1911, 7,357 motor cycles of British manufacture were sent abroad, representing with parts a value of £358.847.

The Midland Race Track.

Mr. F. A. McNab informed us last week that arrangements are well in hand for the flotation of a company to build the proposed two-lap racing track in the Midlands. Two sites are in view—one near the old waterworks at Aston, the other at Shirley; the former is the one preferred by Mr. McNab, as being more convenient for the general public.

The Proposed Yorkshire Invitation Trial.

The Ilkley M.C.C. invitation winter reliability run is not to be held, mainly on account of the A.C.U., which refuses permission to hold an open trial on Sunday, and many will support the governing body in its decision. Besides that, the Ilkley Club finds that under the rules, every participant would have to be affiliated to the A.C.U.

Winter Mudguarding.

The issue of last week containing a leaderette on winter runs had only been published a few hours when we received a message from Rudge-Whitworth, Ltd., informing us that they had experimented with our suggestion for a detachable form of mudguard extension for winter riding. The attachment had been made temporarily and tried on the road by Friday morning, and promises to be successful.

Brooklands and the Six Days' Trials.

The Motor Cycle suggestion to transfer the last days' run of the Six Days' Trials to Brooklands, which has received general approval, is unlikely to be adopted, this year at any rate—more's the pity. It appears that the chief objection is the cost of hiring Brooklands for the occasion—about £25—but surely there would be a good return from the "gate money," as it is extremely likely that hundreds would welcome the chance to witness the final, seeing that it is usual for trials machines to be fitted with new departures undergoing test for the succeeding year.

Up 1 in 8 at 10 m.p.h.

The open reliability trial on the 20th inst., organised by the Herts County A.C., is likely to attract a good deal of attention. Mr. Cooke interviewed the Chief Constable of St. Albans last week, and he is quite interested in the ten-mile per hour climb up Holywell Hill in the centre of St. Albans. It will be an interesting and instructive test, for the Mayor of St. Albans recently stated in court that he doubted whether a motor cycle could climb the hill at ten miles per hour. He happens to be an old motor cyclist, so Mr. Cooke is inviting him to be present on the day of the contest. Holywell Hill has gradients of approximately 1 in 8 in places, and a ten-mile an hour limit is imposed.

The Winter Trials.

E. Marshall, as well as the passenger of the Bounds-Jap sidecar, have written correcting H. Bashall's statement in the last issue that the Bat was the only single-geared sidecar successful in the Exeter run. The Bounds-Jap had a fixed gear, and, we are told, made a non-stop run, except for occasional lamp troubles.

A. T. Stanton desires us to make it known that the coupling of Hugh Gibson's sidecar, which gave way in the Gloucester run, was not of Bradbury manufacture. It appears that owing to the rush for delivery, Gibson had to borrow a sidecar attachment from a friend.

Jas. L. Norton assures us that he is quite a stranger to valve trouble, and that the real cause of his retirement from the Birmingham to York and back run was due to the sidecar tyre peeling off the rim, the resultant delay occupying 30m., which was the limit of time allowed, thus entailing disqualification.

In our report of the Gloucester run, W. F. Guiver was referred to as F. W. Guinness. In drawing our attention to the slip, Mr. Guiver mentions that he completed both the twenty-four hours' London-Exeter run and the twelve hours' run London-Gloucester and back without opening the toolbag of his 3½ h.p. Rudge.

A. Mabon (Rudge sidecar), who was reported in our last issue as not having arrived at Hounslow within thirty hours at the end of the London to Exeter run,

FUTURE EVENTS

Jan. 20.—Herts. County A.C. Open Trial.
" 20.—A.C.U. Annual Dinner.
Feb. 17.—Sutton Coldfield A.C. Open One Day Trial.
Mar. 2.—A.C.U. Open One Day Trial.
" 23.—B.M.C.R.C. Race Meeting.
" 30.—Derby and District M.C.C. Open Hill-climb.
Apl. 5-8.—N.W. London and Herts. County M.C.C. Joint Trial and Open Hill-climb (Yorks.) and Ladies' Competition.
" 8.—Westmorland M.C.C. Open Hill-climb at Shap Fell.
" 13.—Oxford M.C.C. Open Hill-climb

informs us that he arrived at Hounslow in twenty-seven hours. The checker, however, had left. Mr. Mabon, who had been delayed by severe tyre trouble, established proof of his arrival, and the matter is now being placed before the committee of the M.C.C.

J. C. Prior writes to say that he did finish the N.W. London Club's Gloucester run, but not until 11 p.m. His delay was due in no way to his Bat sidecar, but to the fog which caused him to run some miles off the course. Mr. Prior tells us that he climbed Dashwood on top gear and Birdlip on low gear with half throttle, and this without stopping to cool his engine at the hill foot.

It is interesting to note that although the Bowden two-speed gear is designed for 3½ h.p. machines, it successfully withstood the hefty horse-power developed by an 8 h.p. J.A.P. engine pulling a sidecar in the London to Exeter winter run, and helped to earn its rider a gold medal. Owing to an obstruction on Chard Hill, the rider came to a stop, but the engine was started by means of the kick starter, and the combination was got under way without difficulty, and without the rider leaving the saddle. This performance was applauded by those who witnessed it.

About five miles from Salisbury, a new Lucas lamp dropped off the sidecar of Hugh Gibson's Bradbury. He offers 10s 6d. reward to the finder.

Half-yearly Index.

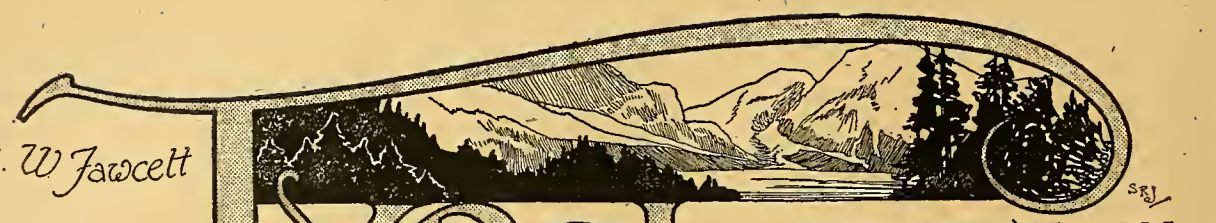
An index to the last half year of *The Motor Cycle* is now ready, and copies may be obtained for 3d. post free, on application to these offices, 20, Tudor Street, E.C.

Auto Cycle Union Notes.

TOURIST TROPHY RACE.—The Secretary has been instructed to write to the authorities concerned to learn when permission to hold the Tourist Trophy Race in the Isle of Man will be granted, and in the event of no definite reply being received within a reasonable time to communicate with one of the principal French motor cycle clubs with a view to holding this important event in France.

SIX DAYS' TRIALS.—It has been definitely decided to hold these trials in the West of England, with Taunton as a centre. The new rules have been drawn up, and after being laid before the Standing Joint Committee (consisting of members of the A.C.U. committee and the Manufacturers' Union) they will be brought before the General Committee for confirmation.

BROOKLANDS AND THE SIX DAYS' TRIALS.—The Competitions Sub-committee carefully considered a suggestion which appeared in *The Motor Cycle*, that the last day's run of the trial should be held on Brooklands Track, but, mainly on the score of expense, it was agreed that this year, at any rate, the suggestion should not be carried out.



QUADCARS.—The Auto Cycle Union has been requested to grant permits to clubs organising trials for the above type of vehicle. As these are not classed as motor cycles by the Local Government Board, the Union feels it has no jurisdiction over them, and in consequence permits cannot be granted at present to clubs to run trials for these cars. The Union has, however, asked the Royal Automobile Club if it will take steps to encourage their development.

AFFILIATIONS.—The following clubs have become affiliated to the governing body: The South Birmingham M.C.C., the Bristol M.C.C., and the Ceylon M.C.C. The latter is the first colonial club to become affiliated to the Auto Cycle Union.

MEMBERSHIP.—At a recent meeting of the General Committee, sixty-seven new members were elected.

PERMITS.—Permits to run one-day open trials have been granted to the following clubs: The Bristol B. and M.C., August 2nd, and the Sutton Coldfield A.C., February 17th. One day is considered to be twenty-four hours.

At a recent committee meeting of the A.C.U., the following resolution was passed: "That, in view of the prevalence of police traps in many of the counties throughout the country, the committee strongly recommend the members of all affiliated clubs to pay all their local taxation licences for 1912 in 'clean centres.'" Motor cyclists are reminded that the whole of the licence fees for dogs, armorial bearings, and men-servants, and part of the motor cycle, car and carriage licences, benefit the counties in which they are taken out. Many counties are making special appeals to residents not to take out licences elsewhere.

By W. Jawett

TO THE TYROL AND BACK ON MOTOR CYCLES

(Continued from page 17.)

Sunday was the next day, but we decided to get along, and left busy Dijon for Dôle, the weather being still comparatively cool.

Just before Dôle was reached we came upon the nicest village we had yet seen, which looked ideal as we slowly approached down a long twisty hill. However, once there we were too busy to admire much, for the main street was bumpy and steep, and we were in for a nice steady pull up out on to the hills again. Poligny was our next stopping place, this time to enquire our way and for Grange to tighten a nut on the carburetter. We were now faced by what appeared to be a wall of hills, and, ascertaining that the road went over them, we set off, delighted to be able to let our motors "out"; nor were we disappointed, for we soon struck something that was worth tackling. I was taking a rather nasty hairpin when I came face to face with a bullock cart and two dull-eyed bullocks. These being successfully passed, I helped my machine with a few sharp digs of the pedals, and after tackling one or two more hairpins the road finished with an almost straight long pull up, which gave no trouble. A further ten miles brought us to Champagnole, and whilst I was buying petrol Grange essayed his French at a *café* and asked for lemonade. A few minutes later he came and asked me why they brought him gin in a bottle and three tall glasses! I tried my luck to see what would happen, and got lemonade, but it was pink.

Over the Juras into Switzerland.

Leaving Champagnole, we soon came to a fork in the road. As I could not make it out on my map and the corner post gave towns or villages I could not find, we took the right-hand road, and after twenty miles reached Lons-le-Saunier-les-Bains, to give the place its full name—which, by the by, it does not deserve—in the middle of the afternoon, and there being no other place of any importance for a good distance on our route, we decided to stay the night here, the day's distance being ninety miles. We found the C.T.C. Hotel Genève excellent. Grange was rather bothered to-day with a slipping belt, but this did not cause any trouble worth mentioning.

Next morning, Monday, July 17th, was as sunny as usual. On wheeling the bicycle out, I found the saddle was loose, and on further inspection I saw the saddle-pillar was broken. I was, luckily, able to have another fitted, at a cost of two shillings, at a cycle shop almost opposite the hotel. Perhaps I had better say here that this saddle-pillar was not supplied with the machine, but was taken with saddle, etc., complete from my last year's mount of different make, as I prefer a saddle that has been ridden some time to a new one.

A very enjoyable run of thirty miles brought us to our proper road, which we joined at Laurent, the scenery now being very impressive, as in the distance we could see mountains like a dark bank of clouds. Grange was quite impressed when told we must cross over them, but no doubt we should find a twisty road and sneak through almost without knowing it. We now began to tackle the Col de la Savine in the Juras, and the going was excellent, the splendid road leading through a pine forest which gave every now and again lovely panoramas of distant mountains and valleys.

A Wonderful View.

A descent to Morez, and we were climbing again, this time the Col de la Faucille, a nice sporting climb some five miles long, amidst magnificent scenery. Very sorry were we to reach the top. At Les Rousses we stopped at the French customs, although I did not think it necessary. A look at our tickets, and we were sent on our way again, to be met by another motor cyclist who had no doubt just left Switzerland. We thought we had reached the top of the Col, but were mistaken, for we afterwards passed it, with its hotel and a number of cars that had run up from Geneva. We were now descending, and very soon came to a view that brought us off our machines in quick time, for we appeared to be on a road cut out of the cliff side, and away to the left could be seen the glittering lake of Geneva, with Geneva itself bathed in sunshine, whilst the road leading down to it appeared twisting all ways. This lovely view kept us full of admiration for nearly half an hour before we started the descent properly. Round the corners very careful driving was necessary, especially after I had seen a light racing car come tearing up, with its driver in a racing helmet and ear rolls all complete. Every now and again a house was passed flying the French flag, denoting we were still in France, although we had left the French customs house a few miles back.

Along Lake Geneva.

Through Gex and then to Grand Saconnex, we came to the Swiss Customs House, and had a chat concerning motor cycles with a customs officer who spoke excellent English. Our C.T.C. tickets were shown here, and we again had no trouble, not even undoing a strap. The roads on the borders of the two countries were in a bad state and very loose.

To the Tyrol and Back on Motor Cycles.—

Arriving at Geneva in the early afternoon, we put our bicycles on the stands, and after tea we saw more motor cycles in the next half-hour than we had seen for a week. The place was alive with them. All appeared to be lightweights, very low geared, the Moto-Rêve and Motosacoche predominating, although the latter is not to outward appearances anything like those seen at home. Our machines and luggage had meanwhile drawn quite a crowd outside, which made our departure rather embarrassing. A halt at the bottom of the street, and we were at the lakeside, with its very animated scene of white pleasure steamers, motor boats dashing about, and white-sailed yachts, etc. We were reluctant to leave Geneva, and decided to revisit it on our way home.

Lausanne was distant about thirty-five miles along the lakeside, and a remark of mine to Grange that we should have just nice time to amble along and then get a good wash before dinner called forth the advice that we must hurry. "But why?" said I; "it is only half-past four." "Rot; it is half-past five," said Grange, and pointed to a clock; then I realised the variation between Swiss and French times, and had meekly to put my watch on an hour.

A fine stretch of Swiss road approaching the Austrian frontier.

The run along the lakeside was charming, but Grange had broken another glass in his goggles, and was troubled with the midges getting into his eyes. At Morges we stopped for a smoke, and watched an angler in a pretty little harbour. Grange had overcome his belt slip just before entering Switzerland by hammering his belt rim up a bit and touching his pulley up with a file, so it did not trouble him again, which was as well, for we expected Lausanne to be on a level with the lake, and were surprised when the road took a sharp turn to the left, and we were confronted by a nasty little hill. The abruptness of the turn and the fact that half the road was up pulled us both off our machines, but only for a moment, and we very soon reached the Hotel Victoria, where we found everything that could be desired.

A Morning's Overhauling at Lausanne.

Next morning, Tuesday, July 18th, we decided to have our first day's rest, and spent it in the hotel garage. We took our cylinder heads off, scraped pistons and cylinders of deposit, and touched up the valves the least bit. I at once became unpleasantly aware that my gudgeon pin and bearings were not wearing as they should do, and I decided to give a pumpful of oil every ten miles instead of fifteen. Grange thought this a good opportunity to put in his new cam wheel, but it would not fit! This was a nuisance, as the old one had given not the least trouble, and the question was, was there sufficient metal left to hammer over again? When replaced and hammered, the old wheel looked like holding, so was left as it was, the new one being put back amongst the spares.

The afternoon was pleasantly spent by a walk down to the quay at Ouchy and thence by lake steamer to Evian-les-Bains, Villeneuve, Chateau of Chillon (which, with all due respect to its admirers, we thought a barn-like affair), Territet, Montreux, Vevey, and back to Ouchy. This trip took all the afternoon, and was well worth it, notwithstanding the inflictions of a man on the boat with a harp.

We had not had a drop of rain so far, and next morning, Wednesday, July 19th, we put on our overalls in continued sunshine, and set off along the lakeside to Vevey, but I had not gone far on this very pretty but dusty road before misfiring set in, to be cured by cleaning the plug and contact-breaker.

All along the road there were plots of land or small fields rising from the lakeside in terraces, given up to the cultivation of the grape, and the men were seen very busy with portable tanks and sprayers syringing the vines, whilst there were also what I call "rain guns"—that is, nothing more or less than a huge funnel-like gun pointing skywards, the idea being to fire it off when a rain cloud is overhead, when, with a bit of luck, one can get rain to order.

At Vevey we turned to the left and began a long climb of several miles up a twisting road, and overhauled and passed a car, much to its driver's surprise.

Along through Bulle we shortly took a road to the right, and Fribourg was soon passed, over a beautiful bridge with the river swirling beneath. Once over the bridge the road to the left was taken, leading to Berne, the Swiss capital, and about eighteen miles away.

Bad Roads in Berne.

On entering Berne I had to wait for Grange, whose petrol supply had almost given out. It was not nearly so easy to obtain petrol as in France, and with only sufficient to last for twenty miles one should begin to think about filling up.

To the Tyrol and Back on Motor Cycles.—

I was rather surprised in Berne to find that the simplest questions in French were scarcely understood, nearly everyone speaking German. The roads, or at least the roads we took through the capital, were a disgrace, and many a back street in a manufacturing town at home would put them to shame.

We were now almost through Berne, and not a sign of petrol had we found, so we asked a man where we could obtain some "essence." A blank stare. Then I tried "Petrol," "Moto-Naphtha," "Stelline," and a few more names, until at last a light dawned on him, and he exclaimed: "Ah! Benzina." We had found another name for that useful spirit. We had to go over a mile to procure it, and I gave Grange some out of my tank before we arrived at a small house with the sign, "Auto - Benzin," where we both filled up.

How hot it was! And our poor engines were hot, too, for the petrol we had bought was awful stuff, and our bicycles ran rather sluggishly on it.

Straight on, through magnificent scenery, over the river Emme, into Langnau. A halt for a cooling drink, a photograph in a pretty village that looked just as if it had been made out of a child's toy box, and we were again off, passing at times lumbering waggons with teams of horses, the drivers often holding a cherry tree branch, which they had torn off some of the many fruit trees lining the roads, and idly plucking the black fruit. The horses were relieved a good deal from the troublesome flies by perforated buckets full of smouldering leaves or some damp sacking which were attached to the pole shaft.

We soon reached another small river, which we followed for some time, when the Bradbury suddenly stopped, without a sign of misfiring. We guessed the trouble immediately, and Grange very quickly had the magneto chain cover off, then his timing gear exposed, and found that his "hammered" wheel had come adrift. A few drops of rain now came down, and as we were only a few yards from an open building, we went inside. We made a small key and replaced the wheel, and were off again under twenty-five minutes.

The rain was only two or three drops, but straight ahead it was pitch black and a thunderstorm raging. We decided to stay the night in a country hotel near by, as it was now somewhere near six o'clock, and we were about fifteen miles from Lucerne, our distance for the day being 105 miles.

(1) Looking down Maria Theresienstrasse, Innsbruck.

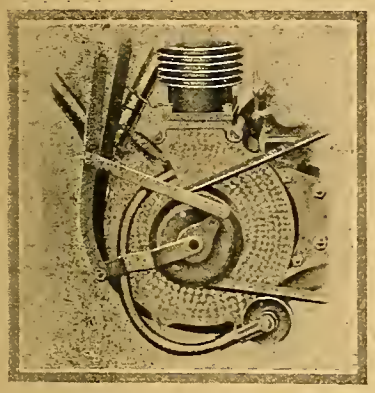
(2) The old clock in Berne, Switzerland.

Next morning we reluctantly left, and were soon approaching Lucerne. Grange was somewhere behind keeping out of the dust, and I was thinking of nothing in particular, when suddenly I saw a long cigar-shaped dirigible disappearing behind a small mountain. Grange came up, but although we waited, it did not appear again.

Lovely Lucerne.

What a picture the approach to Lucerne was that morning, with the dazzling sun on the lake. Following the lake a little, we climbed up a bit, then stopped for a smoke and to admire the magnificent panorama that lay before us. One large branch of Lake Lucerne lay almost at our feet, everything being quiet except for the steady "chug! chug!" of a motor barge in the distance.

Passing through Küssnacht, we left Lake Lucerne behind, but immediately came suddenly upon another about a third as big—Lake Zug, which is something like ten miles along each side. This was, like all the others, perfect.



A drop down to Arth, then a turn to the left, and we struck a little terror of a hill about six miles long, which, like all others, required some skill in negotiating the numerous corners. We were on the edge of a small mountain; on our right the road fell abruptly away, while below was a small lake of a dazzling blue. *(To be continued.)*

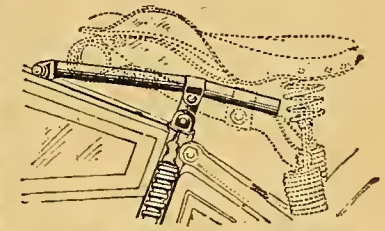
THE NEW YORK MOTOR SHOW.

FEATURES OF THE NEW MODEL AMERICAN MOTOR CYCLES.

THERE are nineteen exhibitors of motor cycles at the Madison Square Garden Motor Show in New York, which opened on Saturday last. Below we briefly describe the principal American novelties and departures from standard practice in this country.

The Aurora Automatic Machinery Co., which makes the Thor, has a new 7 h.p. V twin with cylinders set at 50°. The engine is oiled mechanically by a pump gear-driven off the cam pinion; the oil reservoir is placed close under the petrol tank. The transmission is by chain, and a new two-speed gear has been evolved, with gears always in mesh. The control of this gear is from the left handle-bar, arranged so that no gear change can take place until the clutch is released. A feature of the new Thor spring fork is that both sides of the fork are continued upwards for the handle-bars to pass through, the bars being supported by a stamped lug which fits into the fork side.

Eclipse free-engine plate clutch fitted to the Yale. Note the flat belt and jockey pulley.

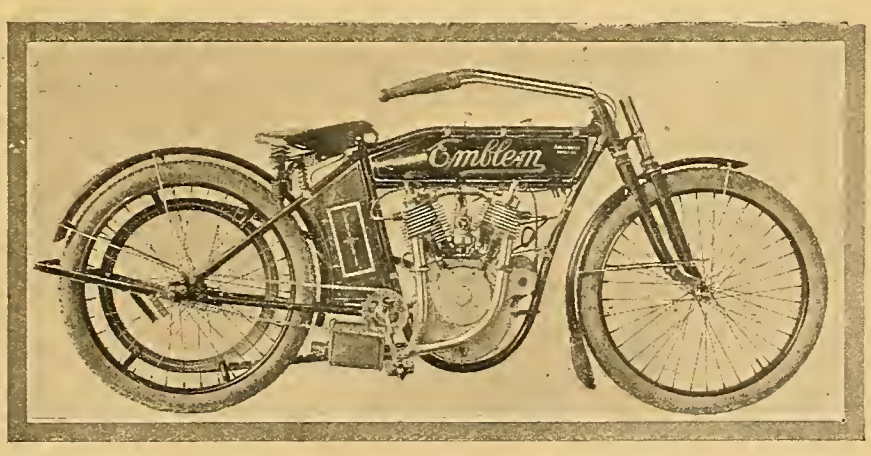


The Yale twins, which are the product of the Consolidated Manufacturing Co., of Toledo, have been augmented by the addition of a 5 h.p. model, with dual lubricating system, consisting of a positive acting gear-driven pump actuated by a continuation of one of the intermediate magneto driving gearshafts. The oil pressure is regulated, and an auxiliary hand force pump is also retained. The same idea of supporting the handle bars mentioned in connection with the Thor has been adopted for this model. The American firm responsible for this design ingeniously allow for adjustment of the belt by fitting rear wheel fork ends, which permit of an eccentric movement of the rear spindle; the total amount of adjustment of the belt is three inches. Purchasers are given an option of dry cell or magneto ignition.

Still Adhering to the Automatic Inlet Valves.

Contrary to English practice, although a newly designed model, the engine has automatic inlet valves, and outwardly follows the lines of the old type Peugeot twin-cylindered engines.

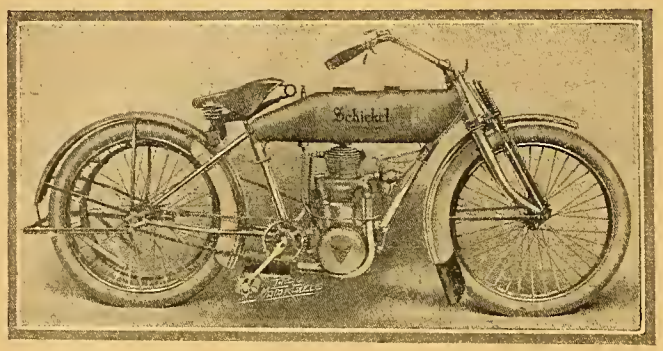
The free engine multiple plate clutch made by the Eclipse Machine Co. is adapted for fitting to the engine-shaft, and is supplied for belt or chain transmission. The mechanism consists of few parts, the clutch for engine belt pulleys having eleven discs held in place by a cover fastened with six screws. Spring pressure can be regulated by hand. The control is from the handle-bar or a side lever at option.



The Emblem Manufacturing Co. is responsible for the introduction of the machine which we illustrate. Several points about it differ from standard British practice. As in the Thor and Yale, the handle-bars are held by three stems instead of one. The saddle frame is hinged to the cycle frame at the peak, and supported on a coiled spring working over a vertical guide connected to the rear stays. This allows a radial movement of the saddle frame in addition to the usual saddle springing. The same firm exhibit a rear tandem attachment, a feature which is altogether missing from modern English exhibits. The seat of this is sprung on coil springs carried in telescopic tubes, one each side of the rear wheel. This firm still adheres to automatic inlet valves.

Showing details of the Harley-Davidson "full floating" saddle.

One of America's Best Productions.



The Harley-Davidson is one of America's best productions. These machines are made in Milwaukee, and for 1912 are fitted with what is called in the States a "full floating" seat. This consists of pivoting the fore part of the saddle frame to the dropped top tube and spring supporting it from the usual seat pillar tube, on the lines of the Emblem previously mentioned. The construction, however, differs from the Emblem in being made up with vertical flanges depending from the horizontal seat pillar and hinged to the cushioning device, which is in the seat tube, as shown in the sketch.

Twin-cylinder Emblem, a representative American mount. The saddle pillar is pivoted to the frame in front and supported at the rear by an extra spiral spring fixed to the frame.

The New York Motor Show.—

Another feature of the new Harley Davidson is the adoption of a rear hub clutch enclosed in a drum on the left side of the hub, and operated by a hand lever working in a quadrant on the seat tube. The usual jockey pulley for the belt is retained, and the width of the flat belt is increased to 2in.

The Schickel two-stroke, the mudguarding of which is worthy of notice.

The Indians are, of course, represented, but as their features were fully described at the time of the Olympia Show there is no necessity to refer to them again here. The same models are shown, but the American equipment differs from the British with regard to saddles, mudguarding, tyres, and a few other items, which enable the prices to rule somewhat lower than the models made for the English market.

An American Valveless.

The Schickel is a two-stroke engine with only three working parts—the piston, connecting rod, and combined flywheel, crank pin, crankshaft, and magneto drive. The radiating flanges are gradually increased from the cylinder base to the combustion head to allow the engine to run cool in spite of the increased number of explosions. The inlet pipe forms part of the cylinder casting, and is so arranged that the exhaust gas heats the ingoing charge. The transfer passage communicates with the crank case by means of ports cast in the rear of the cylinder, and its lower end is bolted with the cylinder to the crank case. There is a compression release in front of the cylinder obtained by means of a mushroom valve opening inwardly. The engine is lubricated by purposely mixing the lubricating oil with the petrol and allowing it to go straight into the motor. It will thus be seen that this American design overcomes the oft-repeated objection to the use of crank case compression (mixing the lubricating oil with the gas) by purposely mingling the two beforehand, and so dispensing with oil pumps and other lubricating devices. It is claimed that perfect lubrication is obtained, and it is only necessary to fill the petrol tank, charge the measure with lubricating oil, and pour it into the petrol tank, and the engine is ready to run. Simplicity itself! if no deleterious effects follow such a system. The machine to which this somewhat novel motor is fitted is on ordinary lines, except that it has a 1¾in. flat belt drive.

The American Motor Co., makers of the M.M., for which Messrs. J. C. Lyell and Co., Great Portland Street, S.W., are agents in this country, exhibit two models, a twin and a single-cylinder. The stroke of the single has been increased to 4in., but the bore remains 3in. as before. The twin has a new Schebler carburetter, flat belt, and jockey pulley. The principal improvements in other directions are four piston rings instead of two, longer pistons, stamped steel flywheels and axles in one piece. Roller bearings are now fitted to the crank axles and crank pin of the single-cylinder pattern. The leading features of the twin are an eccentric magneto drive and cylinders set at an angle of 90°.

Birmingham M.C.C. Ninth Annual Dinner.

THE above club's annual dinner and distribution of prizes took place last Friday at the Imperial Hotel, Birmingham, where seventy-eight members and friends, of whom there was a fair number of ladies, attended. Mr. Herbert Austin (president) was in the chair, and after the loyal toasts had been honoured he called on Mr. Edward Lycett to propose "The Club."

Mr. Lycett mentioned the striking increase of the club membership during the last twelve months, and surprised some of the visitors when he stated that the number of members on the books was fifty per cent. greater than it was at the last annual dinner.

The reply was by Mr. R. Vernon C. Brook (hon. secretary), who detailed the principal events to be organised by the Birmingham club during 1912, and mentioned some of the trophies that would be put up for competition, among which are the James Cup, the Evans Cup, and the Norton Cup; the Lycett trophy will also be again contested this year.

"The Visitors," proposed by Mr. R. W. Duke (captain), brought from this well-known competition rider an earnest appeal to the visiting motor cyclists of Birmingham who were present, and who thought there was little or no chance for amateur riders in their events, to join the club and come and try their skill in special competitions which would be organised for their benefit, and wherein the entries would be confined to those who had never won a prize in a motor cycle contest.

Mr. G. Shaw Scott, replying for the visitors, recounted some of his early experiences with a 1902 Singer motor bicycle, which was so well made and reliable that it ran 33,000 miles in seven years, and then one day, like "The deacon's one hoss shay," it succumbed to the potholes of the Aston Road.

Then followed the distribution of prizes, which were handed to each successful competitor by Mrs. R. W. Duke, the names being announced by the Chairman. We noticed that Mr. R. W. Duke made many journeys from his seat to the raised dais where the trophies were distributed, he being the recipient of no fewer than ten prizes and medals

Straight Talk.

Mr. S. C. Perryman, who proposed "The Governing Bodies," was a little severe in his criticism of the Auto Cycle Union, and Mr. F. Straight, the secretary of that body, must have felt some difficulty in replying to Mr. Perryman's denunciation of last year's trials organisation; but Mr. Straight assured the company that arrangements were in hand for this year's trial which would prevent repetition of past failings, and those who won medals in the A.C.U. 1912 trials would assuredly earn them.

Mr. J. L. Norton proposed "The Press," which was replied to by Mr. W. Grew of this journal and Mr. W. G. McMinnies. The toast of "The Chairman" brought the proceedings to a close at 11 p.m.

The intervals between the toasts were filled in by a musical and conjuring entertainment.

The array of prizes and trophies on a side table made a brave show, and it is seldom one sees a finer display at any provincial club's annual function.

Club News

Chesterfield and District M.C.C.

The annual meeting was held on the 8th inst. The annual dinner and smoking concert will take place on February 14th.

Glasgow M.C.C.

The second annual dinner and presentation of prizes will take place on February 8th at Smith's Restaurant, Gordon Street, at 7 p.m., followed as usual by music.

Wolverhampton M.C.C.

The next breakdown competition will be held at headquarters, King's Hall, Central Arcade, Wolverhampton, on Monday, January 15th, at 7.30 p.m. A whist drive and dance will be held on the 22nd inst. at 8 p.m.

Oxford M.C.C.

The annual dinner of this club will be held at Buol's Restaurant, Oxford, on Saturday, February 3rd. The prizes will include those awarded at the open hill-climb organised by this club last April. A good musical programme is being arranged.

Surrey M.C.C.

The annual general meeting of the club will be held at the Angel Hotel, Guildford, on Thursday, January 18th, at 8.30 p.m. It is hoped to arrange a lecture to take place after the business of the meeting is concluded.

The annual winter reliability trial in conjunction with the Streatham and District M.C.C. for the Marians Challenge Cup will be held on Saturday, February 3rd. The start will be from Leatherhead at 8.30 a.m., and the course will extend *via* Dorking, Farnham, Basingstoke, and Newbury to Andover, returning *via* Winchester and Farnham to Leatherhead.

A breakdown competition will be held on Saturday, February 17th, at the Angel Hotel, Guildford, at 8 p.m.

West Australian M.C.C. (Perth).

Following on the formation of the club, a series of picnics was held. These contributed largely to the immediate success of the club. At the first annual meeting, Mr. Naylor was elected secretary, Mr. Wigmore captain, and Mr. J. C. Cochrane chairman of committee.

Prior to the formation of the club, a run was held to the hill, where, over a difficult course, a short trial took place. R. Wigmore (Triumph) made fastest time (3m. 5s.), followed by F. W. Oats (Brown) and W. Nelson (2¼ h.p. F.N.)

The first official contest of the club was held on December 2nd. This consisted of a hill-climb, the course being steep, in good order, and exactly a quarter of a mile in length. There were three classes: (1) The lightweight class, (2) standard 3½ h.p. machines, and (3) the open class.

Punctually at 3.30 p.m., the lightweight riders were sent up the Mount at minute intervals, in the presence of a goodly muster of supporters and a "cinematograph fiend." The second event proved the most keenly contested of the day, and the time (29⅖s.) was faster than in the open class. For this R. Wigmore (Triumph) won the special prize for fastest time, his machine fairly flying up the Mount. The open event brought out fifteen starters, and was won by S. Naylor, whose performance was very meritorious, as his duties as secretary had kept him so busy that he had not had time to clean his engine. Results:

Class I.—1, J. C. Cochrane (F.N.); 2, W. Nelson (F.N.); 3, F. Lloyd (N.S.U.)

Class II.—1, Roy Wigmore (Triumph), 29⅖s.; 2, T. Norton (Kerry-Abingdon), 31⅖s.; 3, J. Thornley (Triumph), 31⅗s.

Class III.—1, S. Naylor (four-cylinder F.N.), 30⅕s.; 2, W. Nelson (2¼ h.p. F.N.); 3, T. Norton (Kerry-Abingdon).

The A.C.U. formula was used throughout. It is worthy of note that every competitor succeeded in climbing the hill, contrary to the general expectation.

Blackpool and Fylde M.C.C.

Mr. Bennett's lecture will be given to-morrow (Friday), instead of on the day previously announced.

Bedford and District M.C.C.

A meeting will be held at the King's Arms Hotel, Bedford, on the 18th inst. at 8 p.m., for the purpose of forming a motor cycle club. Over twenty names of intending members have already been handed in. All interested are requested to attend or communicate with Mr. H. A. Lock, 9, Grafton Road, Bedford.

Streatham and District M.C.C.

A lecture on the subject of "The Use of Motor Cycles in the Army" will be given by Major Phillips to-morrow (Friday), at the Royal Automobile Club, Pall Mall, commencing at eight o'clock. The annual dinner and prize distribution will take place on Saturday, the 13th inst., at the Holborn Restaurant. The president, Mr. J. W. Orde, will be in the chair.

North-west London M.C.C.

The smoking concert is fixed for Friday the 12th inst., at 8 p.m. An excellent programme has been arranged. On Friday, the 19th inst., at 8.30, Mr. W. G. McMinnies has kindly promised to give his lecture on "Speed." Both the above meetings will be held at the headquarters, the Railway Hotel, West End Lane, Hampstead, N.W., and anyone interested in motor cycling is cordially invited.

Newport (Mon.) and District M.C.C.

The first annual dinner took place on the 1st inst., after which the Chairman distributed the following prizes:

First hill-climb.—1, W. Jones; 2, G. Harris.

Second hill-climb.—1, W. Mitchell; 2, W. Browning and F. Turner.

Third hill-climb.—1, F. Turner; 2, A. Williams.

Fourth hill-climb.—1, J. Herbert; 2, J. W. Foreman.

First speed-judging.—1, A. Axcelson; 2, F. Kelly.

Second speed-judging.—1, G. Harris; 2, F. Mitchell.

Third speed-judging.—1, J. Smith; 2, J. Nurdon.

Petrol consumption trial.—1, J. Nurdon; 2, F. Turner; 3, W. Bennett.

The general meeting will be held on February 3rd.

North Middlesex M.C.C.

The Management Committee met at headquarters on January 3rd, and approved of the fixture list for 1912. Forthcoming events are as follow:

March 16th.—Opening run.
,, 31st.—Non-stop trial (members).
April 5th to 8th.—Inter-team competition with Herts County M.C.C.
,, 21st.—Speed-judging competition.

A fine array of prizes presented at the Birmingham M.C.C. ninth annual dinner.

THE YEAR'S IMPORTS AND EXPORTS.

BELOW we give tabulated figures comparing the imports and exports of motor cycles and parts for the last three years.

Imports of Motor Cycles and Parts Thereof.

	QUANTITIES.			VALUE.		
	1909.	1910.	1911.	1909.	1910.	1911.
Month ended Dec. 31 ..	89	47	77	£5,230	£4,689	£5,818
Year ended Dec. 31 ..	1,442	1,387	1,351	£70,452	£99,284	£107,797

British Exports.

	QUANTITIES.			VALUE.		
	1909.	1910.	1911.	1909.	1910.	1911.
Month ended Dec. 31 ..	317	455	876	£16,962	£17,596	£46,506
Year ended Dec. 31 ..	1,884	3,341	7,357	£105,435	£160,476	£358,847

The enormous increase in the value of British-made exported motor cycles and parts commands attention, the 1911 figures reaching £358,847. This total is considerably more than double that of last year, and over three times as great as in 1909, while the figures for the month ended December 31st show that the demand for British motor cycles is still steadily on the rise.

The motor cycle industry is rapidly becoming an important factor in British trade, and from the Board of Trade returns one cannot doubt the fact that British motor cycles have a firm grip of the market abroad and in the colonies.

A study of the import figures shows that there is an increase in the value of imported motor cycles and parts of £8,513, which comparatively small increase is largely accounted for by imported engines chiefly of the lightweight variety, for which there has recently been a large demand.

ENGLISH-DUTCH RELIABILITY TRIAL.

Thirty-two Nominations for the British Team.

THERE are now more than sufficient entries for both teams in the International Trial to be held in Holland on August Bank Holiday, and it is already apparent that the task of selecting the best team—six amateurs and six trade men—to represent this country will be a difficult one. A glance at the names in the trade team will at once show that England will not be lacking in strength in this department at any rate; in fact, it would be a good team indeed that could beat the trade representatives already nominated.

As a number of entries must be declined, in order that those who are not chosen may take part in other events during the August holiday, the selection of the teams will commence early, and at the latest the names of the teams' representatives will be known by June 30th. A committee will shortly be formed to decide upon the best scheme to select the British team.

G. H. Mansell, sales manager of the Singer Co., astride a new 4 h.p. two-speed chain-driven Singer, the transmission of which is entirely enclosed. The casing is divided horizontally just above the chain centre, and vertically through the centre of the front sprocket. The device is interesting in view of recent correspondence on the subject in our columns.

A Suggestion to Extend the Trial.

The following suggestion has reached us, and we commend it to the consideration of the organising club —the Dutch M.C.C. : "In your issue dated 28th ult. you state that Mr. Citroen expects to collect together at least sixty motor cyclists. Now why not have two teams, and at the same time make it an International Open Trial? There are a great many people like myself who would very much like to go over and ride, but who will not by any chance be chosen to form one of the team.—REX G. MUNDY."

AMATEUR TEAM TO BE CHOSEN FROM	TRADE TEAM TO BE CHOSEN FROM
W. Cooper (3½ Bradbury)	W. Pratt (3½ P. and M.)
Geoffrey Smith	J. Woodhouse (3½ Precision)
F. C. Wasley	F. W. Barnes (6 Zenith)
L. A. Baddeley (7 Indian)	W. W. Douglas (2¾ Douglas)
Vernon Taylor (3½ Rudge)	W. F. Newsome (3½ Triumph)
Seymour Smith (3½ Norton)	Hugh Gibson (3½ two-speed Bradbury)
Fred Dover (3½ Premier)	R. Holloway (2½ Premier)
A. E. Uffleman (3½ Humber)	Sam Wright (2¾ Humber)
J. C. Bennett Mitchell (2¾ Douglas)	W. H. Wells (7 Indian sc.)
Mrs. Cooke (3½ Triumph)	Frank Smith (5-6 Clyno sc.)
C. C. Cooke (3½ Triumph).	H. V. Colver (2¾ two-speed Enfield)
F. A. Hardy	R. G. Mundy
W. O. Oldman (5-6 Bat sc. or 4 Bat bicycle)	R. Lord (6 Rex sidette)
C. W. Wilson (Morgan runabout)	Roy W. Walker (3½ New Hudson)
Gordon B. McKechnie (1912 8 Dot-Jap)	H. Graham Dixon (2¾ New Hudson)
H. M. Carter (2¾ two-speed Douglas)	
Horatio Wallis (1912 f.e. Triumph)	

A number of the amateurs are anxious to witness the trial, whether chosen or not.

Mr. McKechnie says: "Should my competition experience be considered insufficient to entitle me to a place in the team, I will be pleased to accompany the English party."

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Hill-climbing.

Sir,—In your last issue a correspondent suggests that Honister is quite impossible for any motor vehicle. I know the hill very well, and I certainly thought so, but it has been climbed by a 35 h.p. chain-driven Daimler. This car had previously ascended Buttermere Hause (Keswick side), which is also very bad. G. F. WOODHOUSE.

Sir,—"Fair Play" considers Honister Pass an impossible climb for any motor vehicle. I have myself seen a small car—I do not know the make or power—climb the pass, from the Buttermere side, apparently without much difficulty. The surface makes it, I think, impossible for a single tracker, but with a sidecar, four-speed gear, and 5 h.p., there should be little difficulty. The gradient is, I think, not more than 1 in 4. I have helped a two-speed Humber over the pass, and it had enough power, but when stopped by the bad surface could not restart on the clutch without a push off.

Mr. Smith might find it better to fit the sidecar on the right-hand side, the left-hand side of the road (which is very narrow) being the firmer. The right-hand side is cut up by the skid-pans of descending coaches. I have only seen the pass in summer, and know nothing of its condition in winter.

P. A. LEWIS, 2ND LT., R.E.

Sir,—"Fairplay in All Things" objects to Honister Pass as "impossible for any motor vehicle," and characterises my suggestion to Mr. Frank Smith as not quite "sporting."

My reasons for suggesting the route were as follows: That three motor cyclists at least have so far succeeded as to be only waiting for another opportunity; that two other well-known competition riders will also shortly essay the climb; that it is descended daily during the season by coaches and motors of all kinds; indeed, I have personally ridden down both on a lightweight and a 3½ h.p. with sidecar. I was also informed at the Buttermere Hotel that a 14 h.p. car had reached the top.

To suggest any ordinary pimple for the Clyno fresh from the Porlock victory would have been absurd, and as Mr. F. Smith is sighing for other hills to conquer, I think Honister presents an opportunity for him to immortalise himself.

The readers of *The Motor Cycle* will be able to judge whether your correspondent has chosen the wrong *nom de plume*. H. NEWMAN.

The Winter Trials Results.

Sir,—Now that the winter trials are over, it would be interesting to know how many machines went through both the Exeter and Gloucester runs successfully without a repair of any sort. Personally, I noticed one or two riders in the Gloucester run who were riding different machines from those they used in the Exeter run. Were they afraid to take the same machine over both trials because there was not enough time in between to do the tinkering? One would almost think some firms would offer a special prize for the best performance of a machine ridden in both trials. Any machine winning these prizes would be much more likely to sell to the man who watches the results of the trials from a buyer's point of view, and, after all, manufacturers would not send their riders if successful results did not help their sales.

H. C. MILLS,
Capt. North Middlesex M.C.C.

Lamps and Winter Riding.

Sir,—I think perhaps Mr. Harold Brodrick would have left his letter, which appeared in your issue of December 7th, unwritten had he made himself more familiar with the subject on which he touched before giving "a word of warning" as to my second "suggestion."

I have been in communication with a firm of chemists in regard to the use of peroxide of hydrogen, and they inform me that it would have no ill effect "on metal of any kind," especially in the diluted form mentioned.

It would hardly be supposed that an article that is used internally with equal parts of water would injure metal.

Virginia, U.S.A. FRANCIS C. TURNER.

Where to Renew Local Taxation Licences.

Sir,—Recently I received the usual motor licence form from Oakham, but at the top is printed the following in red:

"Notice.—In order to relieve the county rates you are specially requested to take out your licences only at a money order office in the county of Rutland."

I was under the impression that motor licences went to the Road Board for the improvement of the roads throughout the United Kingdom, in which case the use of them for relieving the county rates is illegal. If this be true, publicity should be given to the fact, and all Rutland motorists should be warned to take out their licences elsewhere, especially as the roads of the county are kept very badly, the loose metal never being rolled in, except just in the two towns of Oakham and Uppingham. One at least of the local magistrates is a most intolerant anti-motorist. RUTLANDSHIRE.

[Our correspondent may rely upon it that Rutlandshire is not diverting, or able to divert, any of its motor licence fees from the Road Board. As the whole question of motor licences and establishment licences generally is somewhat difficult to follow, we will attempt to explain it. First of all, the motor licences go to the Road Board, but the county which collects them has a commission to recoup it for collection expenses. For collection expenses a certain sum is set aside by the taxation authorities, and if one county were able to persuade all motorists to pay their licences into it, it would have the whole of it, as it is shared out among the counties *pro rata*, according to their receipts, so that the county or county borough which collects most licences gets most commission. Prior to the passing of the Finance Act, 1910, each county into which a motor licence was paid retained the whole of the money, and the sum total of the revenue so derived was £155,000. In order that the county and borough councils should not lose this revenue it is still paid to them in the same proportion as they were receiving when the Finance Bill was passed. This means that all the motor licence money, with the exception of the commission for collection and the £155,000 referred to, goes to the Road Board for that body to distribute to the road authorities for road improvement. As to the other establishment licences, such as those for dogs, guns, game, armorial bearings, and men servants, these are still retained *in toto* by the county collecting them. To say the least of it, arrangements of this sort are very complex, and have been mainly brought about by the premature passage of the new regulations regarding motor taxation. These ought to have been held over till the whole question of local taxation was gone into by Parliament. It is a subject into which investigation and rearrangement have been promised for a number of years, but nothing has so far been done to simplify the present complicated state of affairs. —ED.]

Sir,—I was very pleased to learn that Mr. Philip S. White is in agreement regarding the penalising of unclean counties, but up to the present fail to see his point as to London being placed on a different footing.

I am, of course, fully aware of the fact that the Metropolitan police force is practically a Government institution, but the view of myself and my friends interested in this movement is that, control by county or control by Government—it matters not—the fact remains that London had twenty-three police traps in 1910, and when we have induced the bulk of London men to give this matter their sympathy and practical support by payment in clean counties, it is for the London County Council to make representations to the Government regarding the loss of revenue.

I was shown an almost pathetic letter from the Essex County Council last week addressed to motorists in general, complaining that £2,000 were lost to the county funds by residents in the said county taking out their local taxation licences in other districts during the past year.

Now this is an excellent start, and encourages one to proceed with the agitation until a remedy is offered by the withdrawal of these very mean and contemptible practices.

In thanking Mr. A. B. Bennett for his practical support, I wish to say that I do not think the postal authorities undertake to forward receipts, and that the method of procedure in the North Middlesex Motor Cycling Club is as follows: Postal orders for the amounts to be paid are sent to the postmaster of the county town of one of the various counties, together with a stamped addressed envelope for the return of the receipt, and generally accompanied by a short note stating the reason the payment is made in this way.

Then some of the members also write to the Clerk of the County Council in the county in which they reside detailing their reasons for making payment elsewhere.

W. H. BROWNE
(Chairman North Middlesex M.C.C.)

Sir,—I append a copy of a communication which I have addressed to the authorities, which will explain itself, and which may be a hint to your other readers to do likewise should they feel justified.

The present is an opportune time to vent this matter.

C.M.

[Copy.]

Birkenhead.
January 2nd, 1912.

To the Clerk to
Cheshire County Council.

Dear Sir,—I have just received a notice for the renewal of local taxation licences, enclosed with which is a circular with the request "that it is to the advantage of the county rate if these licences are obtained within the administrative county."

This is a request to pay my motor licence within this county (Cheshire), but since this county is not a clean one—police traps and methods being objectionable—I have decided to renew said licences, also that for my dog, in a county where no such un-English practices take place. I shall be glad to take these licences out in this county when the above methods are stopped. I am not a ratepayer, though residing in the county.

Multi-pole Sparking Plugs.

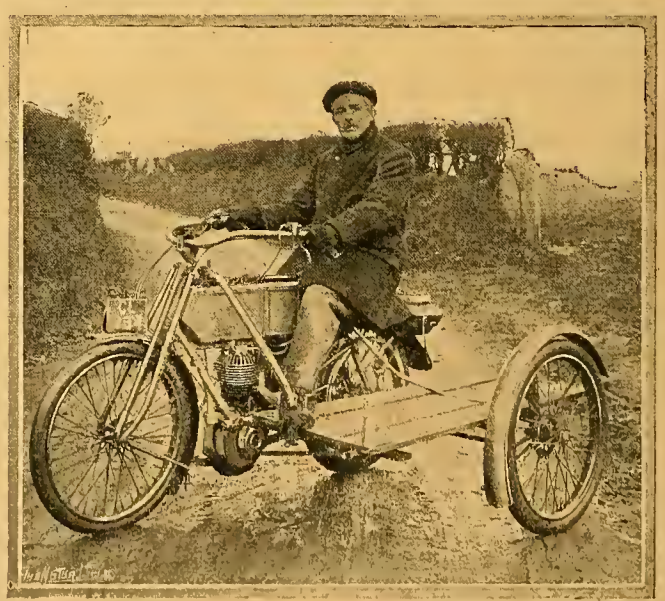
Sir,—To "One of the Seekers," and every other seeker after knowledge on this subject, we are glad to have the opportunity of replying with reference to the points raised in the letter in last week's issue.

It would really not be sufficiently convincing for us (the makers of the Lodge double-pole plug) to state, however definitely, that every ordinarily good magneto did not suffer any strain whatever by firing at two sparking plugs in series. . . . We would, however, respectfully suggest that would-be users of double-pole plugs be not too timorous, and not take the magneto vendors' statements on this subject too seriously. . . .

But really we would very much like readers of *The Motor Cycle* to feel happy and comfortable about using double-pole plugs on their machines—whatever magneto machines they may be using—as they do make such an improvement in the engine power, and the only way we can help them in this way is to ask some of the many motor cyclists who are using both Bosch magneto and Lodge double-pole plugs on their machines, if they would be so very kind as to state briefly in these columns if they have ever experienced any ill effects to their magnetos through the use of the double-pole plugs, or if all is well and satisfactory. We are sure that the trouble taken in so writing will be more than made up for by the value of the information and the benefits it should bring to other motor cyclists.

LODGE BROS. AND CO.

Licence for Sidecar.



Sir,—Having noticed the question of "Sidecar, Peckham," in your issue of December 21st, whether a separate licence is necessary for a sidecar, and your reply thereto, I applied to the chief constable in Manchester for the return of the 7s. 6d. which I paid last October. I have much pleasure in informing you that this was returned the very next day after inspection of my machine. M.O.

Waterproof Motor Cycle Clothing.

Sir,—We quite agree with the Dunlop Rubber Co. that if your readers, when purchasing their garments, would study quality before price, they would be well rewarded. The whole trouble arises from the fact that a large number of "imitation" waterproof suits are being put on the market. If people will only see when purchasing these garments that there is a trade mark of a reliable firm, they can easily fall back on the manufacturers in the event of the suit not fulfilling the purpose for which it is intended. There is one other point that motor cyclists should consider, and that is, when they are putting on or taking off their overalls, to do so with a little care, and they will soon see the benefit. Oilskins are, in our opinion, no use for motor cycling generally, as they are most uncomfortable. EXPRESS RUBBER CO., LTD.

The Motor Cycle for Postal Work.

Sir,—Having seen in a recent issue of *The Motor Cycle* a photograph of the sidecar being used by the Coventry Post Office authorities, I should like to say that a motor cycle and sidecar is easily capable of doing good work in the post office service. I have given an old 3½ h.p. Minerva and sidecar, with body removed, a good test this Christmas, doing all the extra service here (Aldborough, Norwich), carrying over a hundredweight of parcels three journeys a day, and covering thirty miles a day over very bad roads in all sorts of weather. One journey each day was to take all the mid-day mails to a station, six miles distant, and I saved about two hours each time, and, through using a motor, the outside letters and parcels were despatched by the mid-day mail, which would have been impossible had horses been used. Other years three horses were used to do the same work. J. W. FISH.

The postal sidecar referred to by J. W. Fish.

"Stealing" Water for the Lamp Generator.

Sir,—Will you be kind enough to warn those of your readers who are not aware already of the following fact, namely, that it is illegal to "steal" water from the drinking troughs for horses when a policeman who has not much to do is near?

I was filling my generator the other night from one of these troughs, ladling the water with my hand, mind you, into a paper funnel, when one of these "unemployed ones" informed me that he would have to prosecute me for stealing water. I thought he was joking, but he pressed the case, and reminded me of the way the motor 'bus drivers polluted the water with their oily cans. I granted that this was a disgraceful trick, and pointed out the way I was proceeding, but he said this would make no difference. At last I reminded the man in blue that he would be laughed at in any police court when the matter was explained, whereupon he decided to say no more about it "this time." Permit me to wish your excellent, never-missed paper every success in the New Year.

FRED A. TRIGG.

Lubrication Systems.

Sir,—Referring to the recent articles and correspondence on motor cycle lubrication and the mention of our regulated drip-feed attachment, we should be glad if you will insert this letter, emphasising the fact therein unmentioned, that our pump is protected by several patents. The numbers of same are 15481/09, 17295/11, and 14909/11.

In the original form of our patented drip-feed lubricator, the feed is regulated by observing the movement of the pump handle only. Its principle is the same as in the present type illustrated and commented on in your article on page 1394, December 21st, but the addition of a visible drip has greatly increased its popularity. We also make this pump for use outside the tank.

We may say that the Douglas lubricator is made under our master patent No. 15481/09, and that proceedings for infringement are pending in the case of another pump.

BEST AND LLOYD, LTD.

The Evolution of Transmission.

Sir,—"H.T.M.,M.D." in your issue of December 28th says: "'Criticus the Second' is condemned out of his own mouth. Why should his engine seize and so throw him over the handle-bars?"

One morning during the past summer, after riding about fifteen miles, I had occasion to make a call lasting some twenty minutes, and on again attempting to start the machine found I could only move it by skidding the back tyre. Investigation showed that a large irregular segment was missing from the lower end of the piston—bottom of crank case held several fragments of metal of varying size—and one piece, about the size and shape of a postage stamp, had become wedged between the connecting rod and one of the flywheels, thus effectually jamming the engine.

I congratulated myself, first, that the mischance did not occur while driving, and, secondly, and chiefly, that my transmission was by belt.

See "Ixion's" "Comments" in same issue.

BEN CORRY.

Sir,—"Ixion's" comments on shaft drive leave me with the impression that he has not said as much for this form of transmission as it deserves.

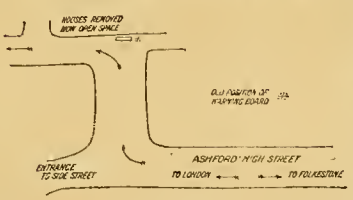
His reason for thinking that shaft drive will not become general on motor cycles for a long time, viz., that its first cost is so high, is absolutely sound, and probably the only real objection to this form of drive.

The pulley, belt, and belt rim, which has helped so much in the development of the motor cycle, still beloved of many, and justly so by manufacturers, is a delightfully simple and inexpensive substitute for (1) a really good clutch, (2) sundry universal joints, (3) cardan-shaft, (4) bevel or worm gear, and, to make a good job of it, (5) a change speed gear box. All of which must be well made, of the best possible material, and carefully designed, and all of which are necessary if shaft drive is to give its full benefits.

The objection to shaft drive on the ground of danger in the event of a seized engine, and the graver objection on the score of harsh and jerky drive, appear to me groundless. They are equally shared by chain drive, which is as rigid as shaft, and they are both overcome by the use of a good clutch, which we most of us know from experience of shaft-driven cars and chain-driven motor cycles is capable of giving as smooth a drive as any belt.

We have now most types of motor cycle engines transmitting power by chain perfectly smoothly, and very large single-cylinder engines doing the same thing with shaft drive on cars. Multi-cylinder engines are, of course, smoother in action than singles, but, given a good clutch, shaft, chain or belt will transmit the power equally smoothly.

If this point is conceded, shaft drive possesses in practice the advantages which "Ixion" admits for it on paper: (1) Shaft drive, properly made, requires no attention beyond oiling over a mileage running into tens of thousands, and costs nothing in upkeep all this time; (2) it is really weather-proof; (3) it makes it possible to mudguard the machine easily and cheaply without making it unsightly or inaccessible, so as to render it absolutely clean to ride on the muddiest day.



Anyone who uses a motor cycle every day of the year must learn in time what these advantages are worth. I think he must eventually create an important market, and manufacturers will then begin to consider his needs. I believe that shaft drive is really more necessary for comfort in bad weather on a motor cycle than it is on a car, owing to the greater difficulties of protecting the transmission, and that eventually belt drive will only survive on the cheaper machines.

I am a country doctor in a district served by bad roads, and for the last seven years have kept one or more motor cycles and a pony and cart. When I used belt drive, the pony had regular work in winter; since adopting shaft drive I have only used the pony six times in two years—in times of snow and floods. I might sell that pony and credit it to shaft drive. During these two years the transmission system has required no attention whatever, and running expenses per mile have been lower than before.

F.C.J.

Dangerous Corner at Ashford.

Sir,—I enclose a sketch plan (not to scale) of an exceedingly bad danger spot in front of my premises at Ashford.

You will notice that vehicles going towards London on reaching this spot would naturally proceed straight ahead, to the great danger of other traffic approaching from the opposite direction, straight ahead being merely an entrance to a side street leading to nowhere in particular. The large red warning board has been removed.

R 7474.

Waterproof Motor Cycle Clothing.

Sir,—The correspondence under the above heading makes claims for "rubber-proofed" material that, as a reader, I cannot pass without protest. It is claimed for this material that "it will keep out a pouring rain for days, and will be as waterproof at the end of six months as when it was bought, provided that it has had moderate care."

I ride daily, for business purposes, and I know that this material does not satisfy the above claims. As an instance, I have just returned from a thirty-five minutes' (not miles) ride in the rain, and my rubber-proofed coat has let a deal of water through at the junction of the sleeve and the front yokes, necessitating a change of clothing. This is the usual occurrence if I am out in a sharp shower, and the coat is not yet six months old.

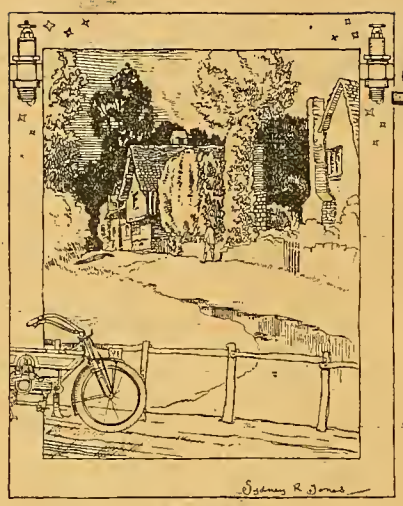
It is my contention that this material does not remain waterproof where it meets with any wear, and I know that this opinion is endorsed by practically all my riding friends. I have tried this material from time to time, but have always returned to oilskins as the best wet weather, and leather as the best all-weather motor cycle clothing. Personally, I do not mind the "sea-dog" appearance if I can keep dry.

B.W.B.

Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

Charging Accumulators with an Alternating Current.



Could you inform me of the best means of charging accumulators from alternating current mains, 105 volts.—F.N.

The current must be transformed to a continuous current, and for this purpose a device is sold by Messrs. A. W. Gamage, Ltd., Holborn, E.C. It is known as the "Union Rectifier."

Twin v. Two-speed Single.

I am investing in a motor cycle and sidecar, but I am in a fix as to which type of motor to buy. I only contemplate using it for week-end runs. I might mention that I am a novice, but have a good knowledge of the workings of a motor cycle. (1.) Would you advise a 3½ h.p. two-speed, or a 5 h.p. twin, single gear, free engine? I do not wish to spend more than £25 to £30, and it appears that 5 h.p. twins are cheaper than 3½ h.p. two-speeders. (2.) I see 5 h.p. 1910 twins for sale at about £28. Would these machines be in good working order after this amount of wear, or would they require a good sum spent in replacements? (3.) Would a two-speed gear, such as a Roc or N.S.U., on a 1910 machine give good service after this amount of wear? (4.) Does a twin require a great deal more mechanical knowledge than a single, and are twins suitable for a novice to start with? (5.) Can a twin with free engine clutch be started from standstill, or must it be used as a running mount?—E.F.

(1.) Of course, the ideal combination is a 5 h.p. with two-speed, and a 5 h.p. with free engine can be purchased for but a little less than a 5 h.p. two-speed. A two-speed gear would be of inestimable value to you, as you live in London. (2.) With regard to your remarks about the 5 h.p. second-hand machine, this entirely depends upon the condition the one you desire to buy is in, and we should not advise you to purchase unless the machine is subjected to a careful expert examination. (3.) Either of the two-speed gears referred to would give good results, provided, of course, they are not too much worn. Probably it would be better to apply to the various makers and see what they have in the way of second-hand machines in stock, as usually the makers overhaul a machine carefully before selling it. (4.) A twin does not necessarily require more mechanical knowledge than a single, but it is a little more trouble to keep up to the mark. A single is much better for a novice to start with. (5.) Yes, if the clutch is carefully used, but much depends on the gear ratio and gradient.

The Roads in Natal.

I am going out to Natal very shortly, and I should be obliged if you could inform me whether the roads outside the towns are at all suitable for motor cycling, and how the duty on imported motor cycles is assessed, *i.e.*, is it the same for new or old motor cycles, as I am undecided whether to take out my 1910 Douglas or get a new machine?—J.B.

There are many motor cyclists in Natal, though the roads are not good for motor cycling in the opinion of the average English rider. Certainly we think it would be worth your while taking the machine out. We believe the duty is reckoned on the second-hand wholesale value of the machine. The fact that it is of British manufacture entitles you to a preferential duty of 12%, the usual duty being 15%.

Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Fitting a Magneto Switch.

I shall be much obliged if you will kindly inform me which is the proper way to attach a switch for cutting out magneto on a motor cycle.—C.J.M.

Fix the switch on the handle-bar, connect the terminal on the switch to the terminal above the contact-breaker on the magneto, which is specially designed for this purpose. When the switch is connected up so that the current goes to earth through the handle-bar, the magneto is put out of action.

Automobile Law.

Can you please inform me where to purchase a book giving the regulations respecting motor licences, etc., showing on what motors trade identification marks can be used, also prices of the tax for business and hire purposes? I have enquired of our local offices and have been told a book can be purchased for a few pence showing the above, and I have tried at the bookstalls but cannot get it.—E.E.C.

The book in question is "Automobile Law Simply Explained," obtainable from these offices price 7d. post free.

LADY MOTOR CYCLISTS IN AMERICA.

There are quite a number of ladies who ride motor cycles in and around Milwaukee, Wisconsin. The Harley-Davidson machine—a local make which we illustrate—is the one most generally chosen, on account of its low build and easy starting engine.

Hertford to Clevedon (Somerset).

I should be greatly obliged if you could advise me on the best route to Clevedon, Somerset, especially if one can miss Bath and Lansdowne without making the journey very much longer; also the best way to avoid tramlines.—A.H.G.

We should recommend the following route: Hertford, Hatfield, St. Albans, Watford, Rickmansworth, Denham, Uxbridge, Colnbrook, Slough, Maidenhead, Reading, Hungerford, Marlborough, Devizes, Melksham, Bradford, Radstock, Compton-Martin, Sandford, Congresbury, to Clevedon.

Registration.

I have purchased from a dealer a 1908 Triumph, the registration number of which I have had transferred to my name. The previous owner has purchased a 1911 Triumph, and is using the 1908 number on the new machine. I am informed by the dealer that I have no right to the number, and that the other man has a perfect right to do as he pleases with the number, and that if he purchased a 1912 or 1913 Triumph he could still use the same number. If that is right, why did the authorities transfer the number to my name?—G.D.

The owner had the power to cancel the registration of his machine if he liked. If, however, he sold the machine without cancelling the number, the authorities had a perfect right to transfer this number to you on your paying the shilling fee. On the other hand, the other man has no right to use the number for a new machine unless he has the authorities' permission. In the case of a machine being sold, both purchaser and vendor should inform the authorities of the change of ownership; unless the vendor gives instructions to the contrary the number goes with the machine.

How to Solder Aluminium.

I shall be glad if you will tell me how to solder aluminium and whether it is possible to join aluminium to brass, copper, and tin with solder.—R.H.J.

It is quite possible to join either brass or copper to aluminium with S.A.L. solder. In the case of copper, it must be cleaned with emery paper and tinned with the solder. In the case of brass, this is first tinned with ordinary tinman's solder and the usual flux. Any flux used is then carefully washed off, and the aluminium to be joined is then tinned with S.A.L. solder and the two joints sweated together.

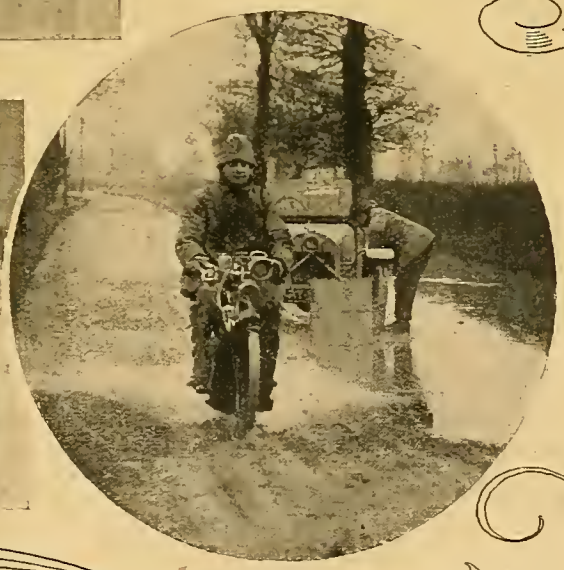
Macclesfield to Woolwich.

Could you let me know the best route to take from Macclesfield to Woolwich? I want to miss the London traffic. My cycle is a 2 h.p. Humber 1911 machine.—E.S.S.

Your best route would be as follows: Macclesfield, Leek, Ashbourne, Derby, Loughborough, Leicester, Kettering, Higham Ferrers, Bedford, Hitchin, Hertford, Ware, Waltham Cross, straight on till you get to Upper Edmonton, where turn right and go through Chingford to Woodford. Go straight on through Woodford, taking the left-hand fork at the first important road you come to, continue through Snaresbrook. When you are there, ask the best way on to Wanstead Flats, and go straight over these. When you get to Manor Park, turn first to the right and then to the left, passing near East Ham Station. Go straight on till you reach Woolwich Ferry. This avoids as much of the traffic as possible. We do not say that you will not meet some traffic, but you do not have to traverse the heart of London.

EXPERIENCES WANTED

C.C. (Hove).—Two-speed Douglas and sidecar. Is the frame strong enough?



H.T. (Edmonton).—5-6 h.p. Clyno and sidecar.

R.W.M. (Whalley, Lancs.)—3½ h.p. New Hudson, Rover, and Singer.

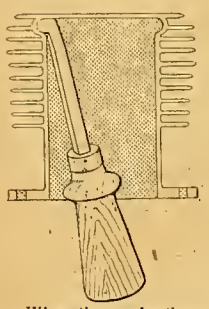
If C. E. Brownlow will send his correct address and note the rules at the head of this feature, his query will receive attention.

LONDON-EXETER-LONDON WINTER RUN. SCENES EN ROUTE.

(1) Cyril Patteson (Zenith sidecar) with George King as passenger passing through Chard.

(2) G. Stevens (5 h.p. A.J.S.-Canoelet) on arrival at Salisbury on the return journey. (3) Eli Clark at the water splash between Shaftesbury and Sherborne. He was one of the seven Douglas riders to obtain the maximum award.

A Sidecar Storm Apron.



H. Taylor and Co., 21a, Store Street, Tottenham Court Road, W., are marketing an excellent detachable sidecar storm apron. It is fitted with straps at the bottom to fasten over the footboard, and has a cape with glove button fastenings, which clips on to the apron and covers the passenger entirely up to the neck.

Lamps in the Exeter Run.

The makers of the F.R.S. lamp set, S. Hall and Sons, Wrottesley Street, Birmingham, are naturally jubilant over their success in the M.C.C. winter run. They inform us that 30% of the riders used their lamps, and that out of that proportion twenty-four riders relied on one lamp only of their make.

The T.T. Race Fund.

Louis C. Cuffe, Manager of the Car Supply Company, Coventry House, 6, Coventry Street, W., who is an enthusiastic motor cyclist, informs us that in the case of any motor cycle purchased through his company, should the purchaser wish to help the T.T. Race Fund, Mr. Cuffe will pay £1 towards the fund. The same arrangement applies to speedometers and sidecars, in which case ten per cent. of the profits received would also be given to the fund. It is interesting to note that several members of the trade are opposed to this sporting event being suppressed.

When the combustion chamber is recessed it is difficult completely to remove the carbon deposit with an ordinary screwdriver. Mr. J. Lucas, Rainhill, Lancs., has devised a tool for the purpose which we illustrate.

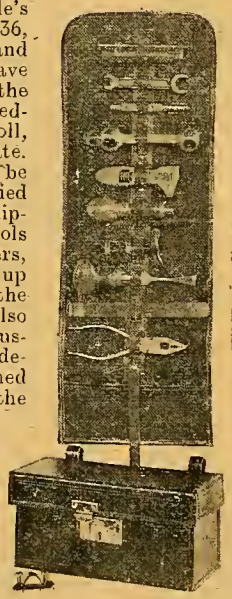
Diary of Running Costs.

We are in receipt of a neat little publication entitled "My Car," produced by the Stern Sonneborn Oil Co., Ltd., Royal London House, Finsbury Square, E.C. Despite its title, the book is as useful to motor cyclists as autocarists, as it consists mainly of ruled pages allowing the amount of petrol and oil consumed each week to be recorded, forming a useful record of the running expenses either weekly, quarterly, or annually. Other pages are devoted to a summary of expenditure for the year, foreign dictionary, spare spaces for remarks, postal information, and a calendar for 1912.

Changes of Address.

In order to cope with their greatly increased business, the "Clincher" tyre sales organisation of the North British Rubber Co. have found it necessary to move from their present headquarters to 167-169, Great Portland Street, W., where an adequate structure has been erected for them. It is expected that the building, which will be known as "Clincher House," will be completed and occupied within the next few weeks.

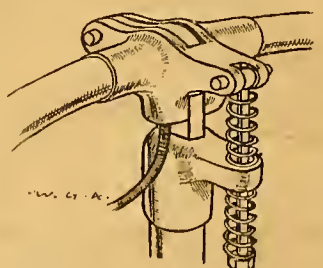
The Hanover Rubber Co. have also found it necessary to secure larger and more convenient premises at 17, Goswell Road, Aldersgate, E.C.



Magneto Branch in Coventry.

The Simms Magneto Co., Ltd., have opened a branch in St. Mary Street, Coventry. In addition to keeping a large stock of Simms magnetos and plugs, a trained staff of mechanics will be located at the above address ready to execute repairs to any type or make of magneto within twenty-four hours.

A Serviceable Tool Roll.



Messrs. Maude's Motor Mart, 136, Great Portland Street, W., have lately placed on the market an exceedingly useful tool-roll, which we illustrate. The roll, it will be noticed, is supplied with a full equipment of good tools by the best makers, and when rolled up fits neatly into the toolbag, which also appears in the illustration, and is designed to be attached to the side of the luggage-carrier.

A tool-roll of stout material is an excellent method of preventing damage to those tools indispensable to the motor cyclist's kit.

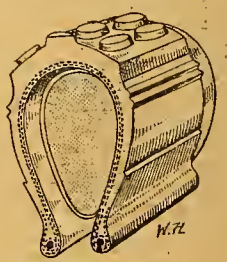
Six Thousand Pairs of Hands.

The rubber trade employs vast numbers of workpeople, and by an amalgamation recently effected in Clermont-Ferrand, the home of the French tyre trade, one factory alone will employ about six thousand pairs of hands in the manufacture, among other articles, of Gaulois tyres. These tyres are made by Messrs. Bergougnan (who have just absorbed another tyre and rubber firm), and sold in this country by the Gaulois Tyre Co.

A new design spring handle-bar patented by Scott (Birmingham).

Repairs and Renewals.

The Hubbard Tyre and Motor Co., Wharf Buildings, High Road, Ilford, which has hitherto confined its attention to tyre repairs, has now completed arrangements to deal promptly and thoroughly with every kind of motor cycle construction and repair work, and a speciality will be made of manufacturing fittings and parts to customers' own designs.



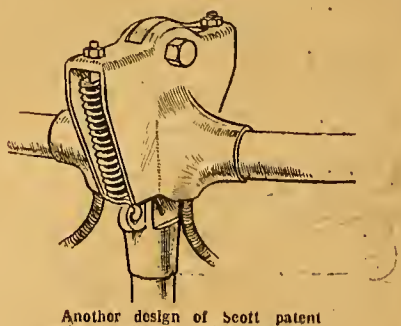
Catalogues Received.

We are in receipt of the latest Calthorpe catalogue, which is well got up and lists the various models made by this firm. The chief Calthorpe features, such as the foot starting arrangement, two-speed gear and free engine, and the principal Calthorpe models for 1912 are fully dealt with.

The catalogue just issued by R. Broadhurst, 25, Smithford Street, Coventry, lists all the best known motor cycle accessories, such as tool bags, sparking plugs, horns, lamps (of which a speciality is made), tools and belt fasteners.

Rubber-studded Covers.

The efficiency of circular rubber studs as a preventive of side-slip has long been agreed upon by practical riders. The Continental Tyre and Rubber Co. have introduced such a pattern of cover of late which appears to be rapidly gaining in popularity. It is not intended that this cover should supersede the basket tread or combination non-skids, but act as a further alternative to a fine range.



Continental rubber studded motor cycle tyre.

The Continental grooved rubber belt is likely to be heard more of in the future.

New Premises.

Nye and Co. are moving into new premises at 16, Hampstead Road, Tottenham Court Road, W. A special feature will be a showroom for accessories only, with a lounge and waiting room for the convenience of customers. There will be a night attendant, who will look after any belated motor cyclists who are in need of assistance. H. B. Willoughby, a southern motor cyclist, has joined the firm as partner.

Another design of Scott patent spring handle-bar, which is claimed to be as effective in absorbing vibration as a spring fork.

1912 CONTRACTS—

of these we hold the largest in the world we believe, and certainly of the best class, comprising such as P. & M., Scott, Zenith, Jap, Bat, Matchless, Clyno, Humber, Douglas, Premier, Bradbury, A.C. and Morgans, and we can also supply Rudge, Hobart, B.S.A., and any other good class machine. In placing your order see that the firm you propose giving it to is one **able to deliver early** as you don't want a machine when everyone else has got one. We have delivery of the above machines each week and can contract for a fixed date if booked; then being **in** the business and **not just opening, we have a sale for second-hand machines,** therefore can give you a good allowance for your old mount. **Note, we don't** offer you a price and on receipt reduce that price from £10 to £20 as many firms are now doing. This is trying to obtain your order under false pretences and a trick we have not and will not indulge in whether we gety our order or not. During the **past three years** we have built up a large business on original lines, and although many new people are starting in the business yet the old-established straightforward firm will stand and be in business when the catch-penny show is no more. Hitchen's know the value of every machine on the market, and if we agree to allow £36, then no one else can allow £46—but often enough when you have sent up your mount they will offer £30—far better to rely on the **old firm** who will give you a written agreement in good class deals to return the motor cycle to you **carriage paid** if a deal cannot be put through. The other firms rely on your letting them have the business in preference to paying return carriage. This in itself is a rotten underhand game, and one you will easily see through, as you must know no firm can give anything away. Another reason why Hitchen's is your firm, and that is, being to the front, they got hold of all the first-class agencies before the others wakened up, and now offer you a bigger assortment **than any other house in the trade,** and as many of these contracts were entered into two years ago you can rest assured **that you get your mount** up to time stated. You, of course, know we are the only firm in the world who send you goods of any kind **on approval** and if you don't like them you are at liberty to **return them within the 3 days** and **have your money back in full.** This applies to everything but new machines. Note the old address, Hitchen's Motor Exchange Co., Ltd., Morecambe, Lancashire. Telephone: 112. Telegrams: "Motor," Morecambe. Canary in full song.

Have YOU Tried THE "STANDARD"?

All Sizes, 1/- each.

COPY OF TESTIMONIAL.

December 21st, 1911.

Dear Sirs,

Just a line to let you know how thoroughly satisfied I am with your belt fasteners. You will, I think, be pleased with the following:—"I used one of your ⅞in. fasteners on my 8 h.p. Matchless J.A.P. in the recent open International Hill-climb in France, and got fastest time of the day at over 62 m.p.h. in the mud." I think your fasteners are made of the right stuff, don't you?

Yours faithfully,
(Signed) HARRY BASHALL.

HERWIN CANNY & CO.,
36, William St., WOOLWICH.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are or sale in their immediate neighbourhood before going urther afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

SECTION III.
Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

9, SHOE LANE,
FLEET ST., LONDON, E.C.

'Phone: 5777 Holborn. Wires: "Opificer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

CORONET SIDE CARS

TRACTION ENGINES

are not required to pull **CORONET SIDECARS.** 3½ h.p. motor cycles can take them comfortably. We do not make the heavy "hansom cab" type that are unsafe in a strong wind.

MODEL C.—£7 2s. 6d.

MODEL A.—£5 5s.

MODEL E.—£7.

MODEL D.—£7 12s. 6d.

Instructive Catalogue post free, giving illustrations and full particulars of all models of Coronet Sidecars. Every model certain to satisfy and save money for buyers. Full of improvements. Quick detachable joints. Latest car pattern mudguards. Wicker, cane, or coach-built bodies. Child's reversible seat. Excellent upholstery.

NOTE front arm which grips main tube of sidecar, which is the only correct mechanical method—nothing lopsided about this attachment.

Delivery from stock to suit TRIUMPHS, N.S.U.'s, REXES, P. & M.'s, BRADBURYS, etc.
Discounts to Agents.

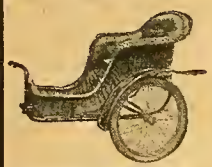
All Accessories included on S.H. at the price advertised.

THE £4-10 REY Sidecar £3-10

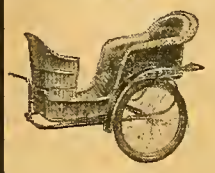


With Hutchinson or Michelin 26 × 2¼ Tyre and Tube 30/- extra.

The famous "REY" EXHAUST WHISTLE now reduced to 12/6 each.

ONLY HOUSE IN ENGLAND FOR QUICK DELIVERY.

REY, 5, HEATH STREET, HAMPSTEAD.



STILL LEADING

MODEL DE LUXE. £5 5 0.

MODEL C. with Cane Body. £6 0 0.

MODEL E, with Reversible and Detachable Child's Seat, £6 10 0

MODEL D, with Coach Built Body. £7 0 0.

Absolutely the finest value on the market.

LESS POWER.

It is admitted by experts that, owing to the unique design, far less power is required to propel Farrar's Sidecars than any other style on the market.

NOTE OUR front arm which grips the Sidecar CENTRE nothing lopsided about this attachment.

OUR quick detachable joints are a treat.
OUR cranked back axles are extensively copied.
OUR design is the safest on the market.
OUR 12 months' guarantee is honestly carried out.

ALL COMPLETE with MUDGUARD AND TYRES.

Discount to the trade.

Delivery from stock to suit TRIUMPHS, REXES, P. & M.'s, N.S.U.'s, etc.

LIGHT, STRONG, AND SPLENDID VALUE.

SPRUNG LIKE A CAR.

Round or Car pattern mudguards at customers' option.

1912 MICHELIN TYRES.

MOTOR BICYCLES FOR SALE.

DOUGLAS, 1911, fine condition; £28.—Colmore.

SCOTT, 1910, overhauled and put in good order; £38; a scarce model.—Colmore Depot, Birmingham.

DOUGLAS, model E, 1911, 2-speed, free engine, footboards, in thorough going order, only a few months old, £40; and another, more used, £38.—Colmore Depot, 27, Colmore Row, Birmingham.

MATCHLESS, 3½h.p., 1911, J.A.P. engine, a fine fast machine, runs better than when new, tuned up and guaranteed in perfect condition; £38.—Colmore Motor Cycle Depot, 27, Colmore Row, Birmingham.

DOUGLAS, 2¾h.p., 1911, nearly new, all parts perfect; £32/10.—4, Carlton St., Nottingham.

1911 Free Engine Triumph, as new, lamp, horn, and spares; £46.—Thomas, builder, Leamington.

3½h.p. Fafnir, magneto, splendid order, with or without 2-speed.—Hawke, printer, Hallaton, Uppingham.

1910 Triumph, £33: Protector mud-shield, new, 12/-; 1910 Triumph flywheel, 12/-.—Pearson, 2, Listergate, Nottingham.

TRIUMPH, 1909½, free engine, Whittle belt, F.R.S. lamp, one spare butted tube; £33.—Crowley, 11, Northey Rd., Foleshill, Coventry.

HUMBER Depot for Birmingham and district, 78, New St.—Order your 1912 Humber from practical motorists and Humber specialists.

1910 Plate Clutch Rex, 5-6h.p., free engine, spring forks, Palmer cord tyres, condition as new; £31.—103, Heeley Rd., Selly Oak.

3h.p. Fafnir, h.b.c., good tyres, new belt, just overhauled, spares; £10; seen by appointment.—R. R Evans, Heath Terrace, Leamington

1911 Humber Lightweight, adjustable ignition, complete tool kit, 2 new belts and spare inner tube.—8,624, *The Motor Cycle* Offices, Coventry.

1910 Moto-Reve, magneto, 2¾h.p. twin, lightweight, everything as new; bargain, £21.—Drapery Stores, 64, Tilton Rd., Small Heath, Birmingham.

N.S.U., 1910, 2½h.p. twin-cyl., m.o.v., magneto ignition, spring forks, h.b.c. carburetter, very fast; bargain, £19/10.—12, Bull Ring, Birmingham.

REX DE LUXE, 1911, 6h.p., m.o.v., magneto, spring forks and seat pillar, aluminium footboards, dripfeed, free engine, 2 speeds, only little used; sell, bargain, £40.—12, Bull Ring, Birmingham.

1911 Model Rex de Luxe Sidette, 6h.p. engine, free engine, 2 speeds, magneto, B and B. carburetter, spring forks, fitted with handsome coach-built sidecar; cost 75 guineas, sell turnout £48.—Brown's, 12, Bull Ring, Birmingham.

MOTOR Cycle, 3½h.p., m.o.v., Bosch magneto, h.b.c. carburetter, spring forks; bargain, £13/10.—12, Bull Ring, Birmingham.

TRIUMPH Motor Cycle, 1907 model, magneto ignition, h.b.c.; bargain, £17.—Brown's, 12, Bull Ring, Birmingham.

TWIN Rex de Luxe, 1909, 5-6h.p., Roc 2-speed and free engine, magneto, spring forks, Continental tyres, fitted with coach-built sidecar; will accept £32 lot, or sell separate.—12, Bull Ring, Birmingham.

MINERVA-ABINGDON, 2½h.p., m.o.v., spring forks, 26 wheels, very low; bargain, £8/10.—12, Bull Ring, Birmingham.

£6/10, or nearest.—3½h.p. Centaur, rehored, new piston rings, valves; seen by appointment.—Proctor, 29, Wyville St., Radford, Nottingham.

BRADBURY, 1909½, excellent condition, new Dunlop studded and Clincher, all accessories, spares; genuine bargain, £26/10.—Kilbee, 35, Wrawby St., Brigg.

1912 Triumphs, Bradburys, Rudge, B.S.A., Douglas, Zeniths, Matchless, New Hudsons; handsome present to all customers.—Clifford Motories, Eastwood, Notts.

QUADRANT (Birmingham), re-bored by Gradior, B and B., Albion adjustable pulley, new belt rim, condition good; offers.—Haugh, 29, Henley St., Stratford-on-Avon.

3h.p. N.S.U., Whittle, low, £6/10; 2¼h.p. Langham 26 wheels, £3/10; 3½h.p. Fafnir, Chater-Lea, magneto, and sidecar, £22.—Potter, Springfield Rd., Shepshed, Loughborough.

1911 Model Water-cooled Rex, 3½h.p., Dunlop tyres, Bosch magneto ignition, Brown and Barlow carburetter, spring forks, equal new; bargain, £29.—56, Sutton St., Aston Manor.

HENRY GARNER, Ltd., 78, New St., Birmingham, the Humber Midland Depot.—All 1912 models now on view; earliest deliveries with a guaranteed promise; exchanges and trials arranged.

SINGER, 3½h.p., 1911-12, with or without N.S.U. 2-speed gear, condition equal to new; price with spares and gear, £48; without gear £43.—No. 9,041, *The Motor Cycle* Offices, Coventry.

5h.p. 1909 Rex de Luxe, 2-speed, clutch, recently overhauled at works, new steel studded tyre, lamp, tools, spares, condition perfect; bargain. £25. — A. Francis, Hyde House, Leamington.

3½h.p. Rover, late 1911, Triumph free engine, only run 600 miles, bargain, 38 guineas; also new 1911 2h.p. Singer Moto Velo, makers' price £35, will take best offer over £30.—Beck, Chapel St., Rugby.

The Cut-out Again.

IT is now definitely known that the Local Government Board will prohibit the use of cut-outs on motor cycles and cars, and it will be interesting to see how it will set about what will be a most difficult task. (1.) How are the regulations to be carried out, and will their interpretation be left to police discretion? (2.) Presuming that the L.G.B. says no silencer shall have a cut-out, will the average policeman know what a cut-out is? (3.) If the decision as to efficiency or otherwise of a silencer be a question of dimensions of total cubical capacity, or area of exhaust outlet, or some other mathematical calculation, will every old and new machine have to be submitted to an examination before registration? (4.) Will the authorities who now issue the index numbers be sufficiently expert and know enough about motor construction to be competent to decide? Our reply to the second and fourth queries is an emphatic No! We would go further and say that there never was, and is not now, any necessity for further legislation on the question of silencer cut-outs.

There is already a law on the subject which the authorities could have easily tested had they felt so disposed. We refer to the statutory prohibition against so using a car or motor cycle as to cause a nuisance. This being so, is it necessary or expedient to introduce fresh legislation until the present law has been fully tried and proved ineffectual? A fresh regulation will be merely an addition to our already complex laws which are not fully understood by the people, and are often incorrectly administered because those whose duty it is to see they are properly carried out do not in many instances interpret them correctly.

No one would reasonably contend that the judicious use of a cut-out was a nuisance; therefore why not rely on the existing law with regard to excessive noise constituting an inconvenience to others, which is the meaning of the word nuisance, and prosecute those riders who by the use of a cut-out in towns and other places become a nuisance to those who have complained.

Another point that should not be overlooked is that the abolition of cut-outs will not prevent noise, some engines being so designed and made that they are more noisy than others, whether a silencer cut-out be fitted or not. Of this there is no doubt whatever, as a variation in the sound of the exhaust can be made by an alteration in valve setting.

It is announced that the Royal Automobile Club has been consulted in the matter by the Local Government Board, and has been asked to make suggestions for dealing with the question. Doubtless its advice will be largely acted upon, and we have no doubt it will, before communicating with the L.G.B., consult its sister organisation the Auto Cycle Union, as the recommendation should apply equally to motor cycles and cars. If the suggestions were to take the form of a reference to the present law, detailed above, there perhaps would be no necessity to go any further, and the prosecution of those riders who are sufficiently callous or negligent as to cause a nuisance would take the usual course. It would appear at the moment that neither the L.G.B. nor the R.A.C. is aware that the matter could be easily dealt with under the statutory powers.

Streamline Bodies for Motor Cycles.

WHY NOT?

THOUGH it may seem absurd on first thoughts to suggest a streamline body for a motor cycle, there is no question of doubt that such a wind-cutting fitment would materially aid the racing motor cyclist on the track. Racing has of late become such a fine art on Brooklands that new and up-to-date mounts are only capable of reducing by fractions of seconds the more important short distance records, consequently one's thoughts naturally turn to exterior aids to speed. So much experimenting has been done with special compression ratios, valve

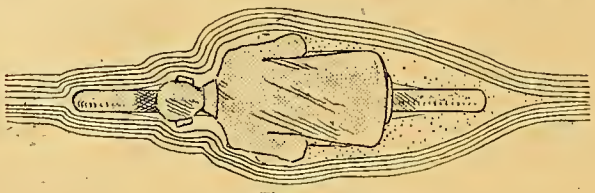

Fig. 1.

timing, cam design, carburetter fakements, etc., that it would appear strange that track racers have not turned their serious attention to wind cutting devices to envelop their body, such as we are dealing with, especially as the veriest novice knows how he must huddle himself up along the top tube to get the maximum speed out of his machine. Of course, the idea is suggested by prevalent racing car practice, and it is wonderful the big effect the streamline body and disc wheels have had upon the speed of even moderate-powered cars.

A motor cyclist's body, no matter what contortions he may perform to reduce wind resistance, is of irregular shape, and consequently has a considerable retarding effect. Air is reluctant to adapt itself to sharp corners, projections, and irregular surfaces, and some idea of the behaviour of rushing air on a motor cyclist's form is shown in the plan view fig. 1. The shaded portion at the rear indicates the region of a complicated series of currents and eddies which all absorb power, or in other words considerably reduce speed. If a body is so shaped that it has sharp corners or recesses, the fluid flows past these, leaving pockets, and forming what are known as surfaces of discontinuity.

The Advantages Derivable.

It is, therefore, easy to realise that a streamline covering to envelop the rider's body is bound to effect a considerable improvement in the matter of speed, and once records have been made by the aid of such bodies, it is unlikely that a rider on a machine of orthodox design could recapture them. The shape which has been found to require the minimum power to drive is a long fish-like surface with the blunt end facing towards the direction of motion. It was found that when the same body was placed with the thin end opposed to the wind that the driving force had to be greatly increased.

A fish—particularly a mackerel—has the most perfect streamline form in natural life. The bodies of birds are a very near approach. By referring to fig. 2 one may grasp the action of the air currents when moving past a body of streamline form such as would be used to envelop the motor cyclist. It will be seen from the second sketch that the outer jets of air curve round and flow over the sides, the greatest deflection taking place at the front edge. There is practically no loss of energy in this design due to surfaces of discontinuity. The definition of "streamline form" is that it is a body of such shape that its motion through a fluid does not give rise to surfaces of discontinuity. In other words, at no point upon the body does the fluid tend to do other than follow the contour of the body. The nearer the body is to streamline form the smaller will be the surrounding volume of fluid affected, whether air or water, and hence the smaller will be the power required to propel it at a given speed.

Power Absorbed by Wind Resistance.

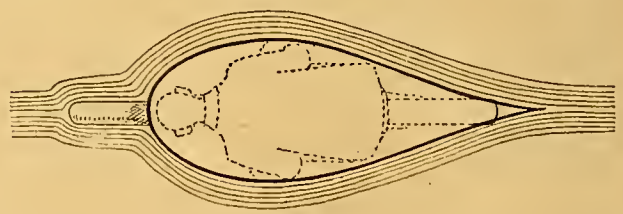
Using the Eiffel Tower formula, $.003AV^2$, which is generally accepted as the most reliable, and assuming a motor cycle and rider to have a surface of 4.6 sq. ft. opposed to the air, the horse-power absorbed by wind resistance at various speeds is as under:

m.p.h.	h.p. absorbed.	m.p.h.	h.p. absorbed.
10	.035	60	7.944
20	.278	70	12.625
30	.993	80	18.850
40	2.227	90	26.681
50	4.350	100	34.800

It is obvious from the above that the Eiffel Tower formula is much too liberal and totally unsuitable for motor cycle use. The R.A.C., realising the above fact, place the constant as .0017, which would approximately halve the powers stated above.

Naturally the question of wind resistance is of paramount importance where cars are concerned, but is almost negligible in the case of touring motor cycles at moderate speeds, which, by reason of their design, offer so little resistance to the air. With racing motor cycles the question is very different, as the power absorbed by wind resistance increases so enormously at high speeds.

Numerous experiments have proved that the resistance of air to a normal plane varies as the square of the velocity. At very high speeds the resistance



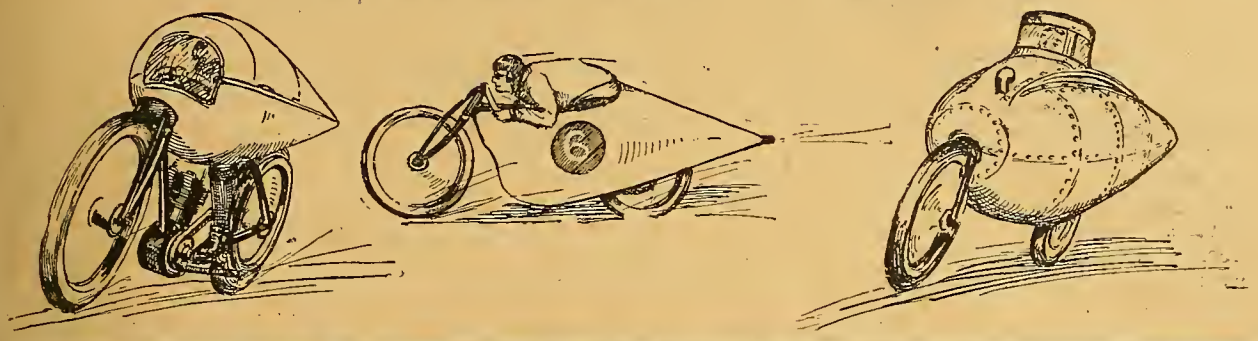


Fig. 2.

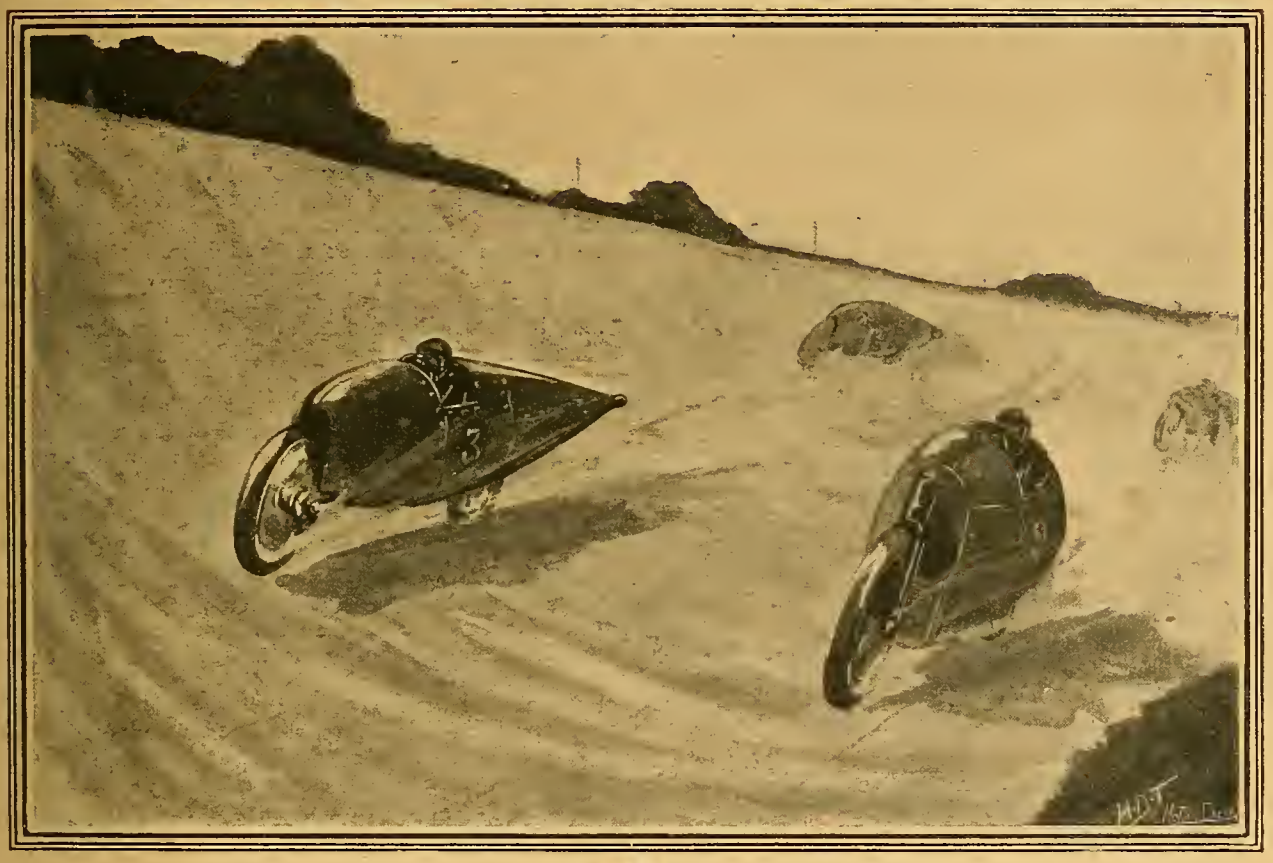
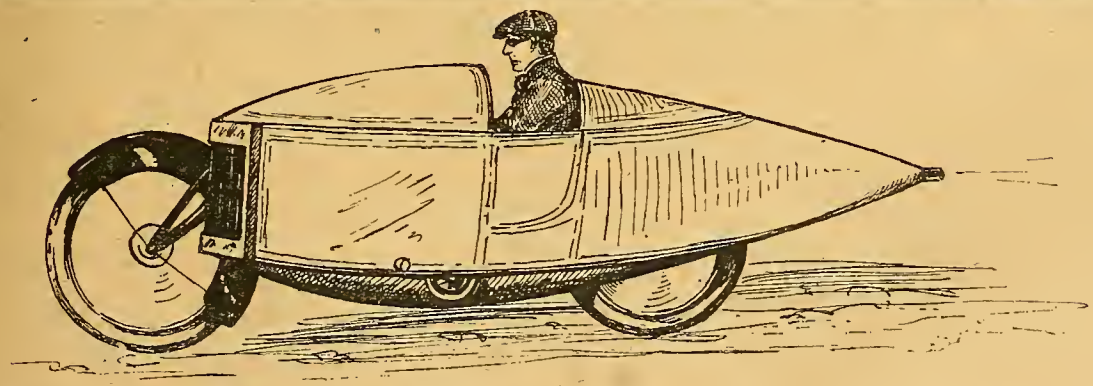


increases at a greater rate than the square of the velocity, until a maximum is reached at about the velocity of sound, viz., 1,100 feet per sec., or 750 miles per hour.



It has been estimated by one of our leading riders that almost as soon as the streamline body is tried on a motor cycle the speed will increase at least 10 m.p.h. Who will be the first to adopt this plan?

G.S.

THE STREAMLINE BODY APPLIED TO MOTOR CYCLES.

Top row—
(1) The streamline shell for track racing purposes. (See article on opposite page.) (2) The fish tail type, which might prove rather too warm for the engine ! (3) The submarine body.

In the two larger illustrations our artist has endeavoured to depict possible developments of the future on road and track in connection with streamline bodies.

The Effects of Abolishing Cut-outs.

It seems highly probable that noisy exhausts will be legally abolished within a very few months. The wails so commonly heard denouncing the innovation on the ground that hill-climbing must suffer strike me as quite beside the mark. It is gratuitous to imagine that the ingenuity of the trade cannot evolve a silent machine of 500 c.c. which will climb as well as present-day noisy models. But should the trade fail in this not very arduous task, the only effect will be a general lowering of standard gears by a small fraction. An open cut-out does not affect a greater improvement in climbing powers than the reduction of the gear from, say, 4½ to 5 to 1.

My own belief—and Brooklands experiences bear me out—is that within a single season exhaust clearance will be improved, with a great gain in silence, so that the absence of a cut-out (if the cut-out be abolished) will be imperceptible. If I am too sanguine, the effects of a legal prohibition will be twofold—first, a general lowering of gears, and, second, a growing popularity in more penetrating alarms than the ordinary booter.

A High Speed Passenger Reliability Trial.

The idea of a Manx or other T.T. race for quadcars and other forms of sociable is scarcely practicable at present. Design is not sufficiently stereotyped for such a race to fill, except on a handicap system, and the best handicaps would fail to satisfy the sponsors of the various designs on the market. But until such designs become standardised (if ever they do!), a high speed reliability trial on Brooklands Track would be wildly interesting.

Many of these tiny chassis are the productions of small workshops, and the cash at the inventor's disposal seldom allows him to put a sample chassis through a Six Days' Trial. A high speed reliability test on Brooklands would be cheap by comparison, and would cater for all horse-powers and designs, besides providing an accurate "line" to the capabilities of different makes.

To be really instructive, such a trial should continue through the daylight of two consecutive days, making up a running time of twenty-four hours in all. There need be no marking of the split second type, which is as irritating as it is useless, except in "knock-out, find-a-winner" events. We might simply set a 3½ h.p. outfit to average 30 m.p.h., a 5 h.p. to average 35 m.p.h., and an 8 h.p. to average 40 m.p.h. for twenty-four hours (divided into two twelves, on consecutive days), all stoppages, except for replenishing tanks, to incur loss of marks, and the speed set to be a *minimum*, not a timing test, with no gain or loss for excess speed. At the finish of this trial we should have a fairly shrewd idea which of the numerous runabouts are reliable for long distances and which are not.

Winter Trials.

The percentage of successes in the 1911-12 "Arctic Trials" shows that further advances have been made in reliability, though the increased nerve and experience of the riders account for something, nor can we forget that really severe winter weather might in any year reduce the number of gold medallists to zero. The condition of the men and the machines at the end of their gruelling journeys, added to a consideration of the polar garb donned by the majority, points to the need of a special winter "body" for the true all-weather rider.

I think if I were a commercial traveller, using my machine week in and week out for business purposes on compulsory rides, I should fit a permanent winter body between November 1st and March 1st, to wit, a light aluminium torpedo, resembling that on the Roc tricycle, with a high front, and sides brought well back. A light detachable steel framing, with aluminium panels, or leather shields, would serve to keep two-thirds of the anatomy warm, dry, and clean. The best of the existing winter shields seems to me to consider the machine rather than the rider; and more complete protection for the rider should be attainable without a great sacrifice of weight or convenience.

Handle-bar Free Engine Control and Side-slip.

I take a diametrically opposite view of this question to that urged by Mr. Wrowe in his letter of January 4th. He thinks that the skilful manipulation of an "h.b.f.e." (there's a portmanteau abbreviation for you!) reduces the liability of sideslip. Other things being equal, its effect is exactly the reverse of what he states.

To begin with, most handle-bar free engine controls are deficient in leverage, and their operation throws a distinct wrench on one end of the handle-bar, which spoils the easy, delicate balance maintained by two unencumbered hands. Further, the letting in of a clutch (unless the clutch be very perfect and very perfectly operated) causes the rear wheel to snatch at the ground in a much more jerky fashion than when a valve is dropped on a flexible engine with the control levers sensibly set.

For these reasons I, personally, never use my handle-bar free engine clutches when the roads are treacherous, but prefer to drive as if the clutch were non-existent. I only use a clutch on treacherous surfaces when I find it awkward to get started, *e.g.*, on a slimy upgrade with nailless boots. Even under these circumstances the back wheel is nearly sure to skid in the course of taking up the drive; but a skid does not really matter at the very low pace implied, especially with the feet trailing. I should not dream of driving any distance in this fashion, *i.e.*, at four or five miles an hour; first, because I might as well walk, and, secondly, because skids are much less probable at a higher speed.

FOOT-STARTERS.

A Review of Current Practice.

AS to whether the motor cycle, considered purely as a locomotive, has undergone any material improvement since the first month of last year there may conceivably be some little doubt, but there is certainly room for none upon the question, "Has it become more convenient and handy?" In this connection it is perhaps not going too far to say that the general and rapidly growing use of some form or other of easy starting mechanism is a step forward of such magnitude as to be worthy of classification with the introduction of variable gears, magnetos, and spray carburetters. The addition of a very simple device has already robbed the critics of the motor cycle of one of their most powerful arguments. Until lately they have been right in declaring that the average two-wheeler was a machine fit only for men of vigour and activity; now, however, they must admit that it can be mounted and ridden with practically no serious effort whatever. This, it need hardly be said, is a fact of the utmost value to the industry, for it means that the ranks of motor cyclists will be swelled in the immediate future by many who have until lately justly regarded the motor cycle as something entirely beyond their physical powers. In a few words, the foot-starter has made the motor cycle a practical vehicle for ladies and men of some years; at the same time it has proved an added comfort to those who were motor cyclists already.

Will Foot-starters become Universal?

There were few firms of any note amongst the first flight who did not have at Olympia at least one model fitted with a kick-starting apparatus, and I question whether any general tendency was ever so welcome to all and sundry. It is true that one big, but conservative, manufacturer advanced the opinion, as an excuse for retaining it, that the run-and-jump-on-"ares," but in order to rope in the "mightbes."

This much, however, is at least certain. No one who has ever used a foot-starter would willingly start by any other means. In getting a start up hill it is a paramount necessity, in traffic it is a perfect blessing, and at all times it is most eminently desirable. When it comes to sidecar work its value is even better demonstrated, for who can deny that even the strongest of us find the pushing of a heavily loaded sidecar combination a very big physical effort against the smallest gradient; indeed, even in my own small circle of acquaintances there are three people who have either temporarily or permanently denounced the sidecar for this reason alone.

Faults in Design.

Turning to the examples of foot-starters at the Show, exclusive of those used with ordinary pedalling gear. These, whilst being upon a single principle, exhibited a variety in application, yet nearly all were open to much the same common criticism, viz., that, if anything, they were, for the most part, upon the right side, and that in only very few cases was there any sign that the mechanism was eventually intended to be covered in. Another objection is that with the larger engines sufficient precaution was not taken against backfires. It is all very well to say that if large car engines can be started by hand as easily as they are there should be no difficulty about starting smaller motors by foot, but the conditions are by no means the same. First of all, with practically all the foot-starters that have yet appeared the starting pedal is geared up to crankshaft, in order to get at least a complete revolution of the latter with half a revolution, or one thrust downwards of the former. The result of a backfire is, therefore, proportionately exaggerated. Next, car engines have big flywheels, which enable them to be "swung"

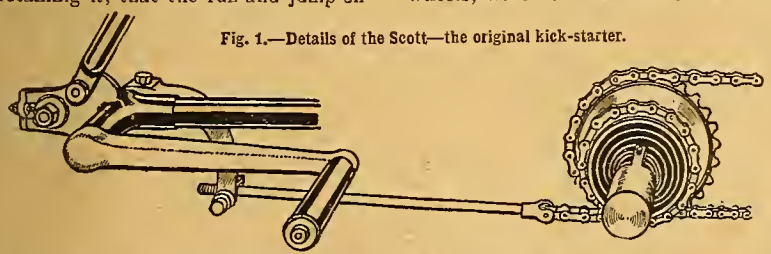


Fig. 1.—Details of the Scott—the original kick-starter.

mount was, under all the circumstances, the best possible, the easiest, the quickest, and the most reliable, and that nothing better was wanted by the average motor cyclist; but this, at best, is a prejudiced view—the view of a man who fails to realise that development is made not so much to benefit the "has beens" and the over compression, whereas the smaller motor cycle engine must be forcibly pushed over compression.

To overcome this difficulty with the bigger sizes of engines one of two things is necessary, either some form of half-compression device must be employed, or the starting pedal must be arranged to throw itself out automatically with a differential clutch arrangement. The former device is adopted on the Scott and the latter on the Indian.

Before describing the various mechanisms in detail, one point deserves mention, namely, that it must not be supposed that the mere use of a foot starter gets rid of all starting troubles. It requires some address and knack in its operation to be entirely successful, otherwise it is likely to cost as much effort as a push start. For this reason it is of the greatest importance that it should be placed in such a position that the maximum purchase can be obtained upon it, for if not it is likely to be more trouble than it is worth. As to which is the better side for it, that is a matter of taste, but considering that the majority of sidecars are fitted on the left, there is a good case for the right side.

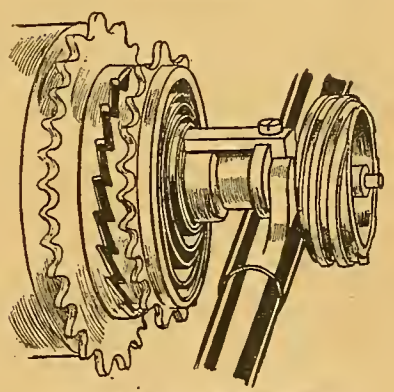

Fig. 2.—Scott ratchet on clutch drum.

A Prototype.

The Scott mechanism is shown in figs. 1 and 2. Needless to say it is dealt with first, as Mr. Scott was without doubt the originator of the kick-starting gear for motor cycles. With patent rights I am not particularly concerned, but I imagine that whether any of them were infringements or not upon it, Mr. Scott must have been gratified to find his original idea so manifestly vindicated at Olympia.

As shown in fig. 1 it consists of a bell-cranked foot lever supported in a bracket attached to the chain stay close beside the back hub. The lever starts the engine by driving the two-speed counter-shaft through a free-wheel clutch. The chain sprocket for this purpose is provided with an internal spiral spring for rewinding the chain about itself, whilst the bell-cranked lever is returned by a separate spring. This bell-cranked lever was formerly carried as a sleeve on an extension of the back hub. It has now been placed as shown in order

Foot-starters.—

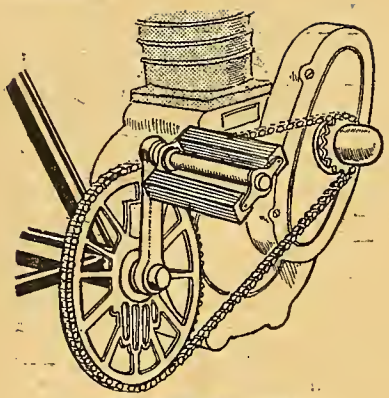

Fig 3.—Rudge pedal starter.

to avoid the necessity of adjusting the starting chain when adjusting the rear-wheel driving chain. This adjustment is, however, necessary when the engine chains are tightened.

The position of the pedal is excellent in every way, as it allows of a strong backward and downward kick—the direction in which the greatest strength can be exerted—and it is also out of the way.

get a start with the exhaust lifted and drop the latter as soon as a reasonable speed of rotation is reached. The same thing applies to several of the other starting gears, but it is not, in my opinion, so good a precaution against backfires as a half compression device, for the reason that a tolerably full cylinder of rich mixture must be used to make sure of an explosion, and in these circumstances there is some possibility of a backfire following any carelessness in handling. Further it must be borne in mind that the higher the gear ratio employed the more vigorous must the kick be, as continuous rotation such as one gets when pedalling the engines round is not possible.

Details of the Rudge clutch mechanism, which is highly ingenious and effective, are shown in fig. 4, the parts being placed in their correct assembling order, but extended. A is the tapered and rough-fluted end of the timing wheel spindle, C having an internal taper of the same degree but smooth. B is the bearing carried in the wall of the timing gear case, the slot in its larger diameter serving to anchor the up-turned end of a small brake spring which runs in a groove of C. The last named is provided with a quick-thread drum which is engaged with a similar quick-thread

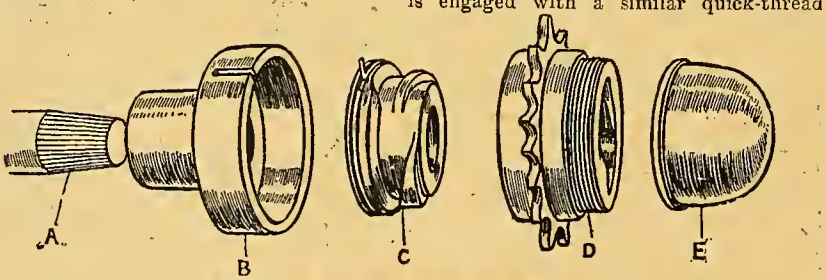

Fig. 4.—Details of Rudge clutch starting device.

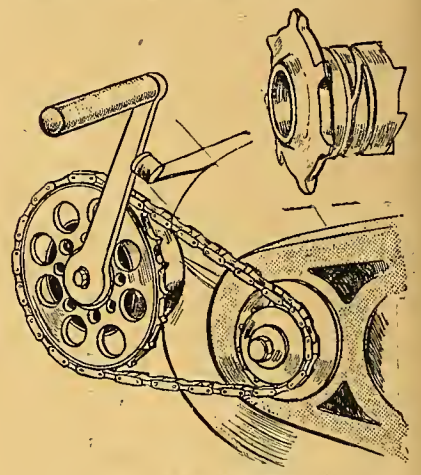
Fig. 2 shows a detail of the countershaft, namely, the free-engine clutch, the driven ratchet being applied to the high-gear clutch drum which is geared down to the engine about 1½ to 1. The clutch runs loosely as a sleeve upon the countershaft spindle, the bracket of which carries a finger which supports the inner end of the spring. This is of the "clock" type, but it is pulled outwards axially so that it exercises a side thrust upon the clutch as well as a rotating moment. Inside the free-wheel sleeve the spindle carries a cam, which, when the starter is out of action, brings the two ratchets entirely clear of one another, so that there is neither noise nor wear. The compression release used with the starter consists of a small mushroom valve in each cylinder at what is practically the bottom of the stroke.

An Ingenious Starting Clutch.



The Rudge foot starter, although employing the same principle, is carried out in an entirely different manner, the pedal being attached to a large chain sprocket which is carried at the bottom bracket and drives the engine through a small sprocket mounted upon an extension of the intermediate timing pinion spindle. The gear between the sprocket and the engine is thus about 6 to 1—a ratio sufficient to give three complete revolutions of the crankshaft for one push down. There is thus time to

nut cut internally in D, which is the driven sprocket. E is simply a dust cap. The operation of the mechanism is as follows:

C being inside D and having a left-hand thread, clockwise rotation of D tends to force C to the left as its rotation is resisted by the brake spring above mentioned. This causes it to be forced on to the taper of A, which it immediately grips and drives, the friction of the engine only serving to lock it tighter. Directly the engine fires C commences to rotate, and if D be held stationary (the foot being at the time upon the starting crank), C screws itself into D and thus disengages the cone clutch, after which the mechanism is quite free of the engine, none of the parts rotating at all. The sprocket D takes a bearing upon the larger diameter of B.

The Prevention of Damage by Backfire.

A device which is in some ways rather similar to that of the Rudge is employed in the Indian foot starter. This is placed in front of the engine from the left-hand side—a position which, from the leverage point of view, might be possibly bettered, although the starting pedal itself is well out of the way. This pedal is connected up to the large chain sprocket with a double set of clutches—the arrangement of which I am unfortunately not permitted to describe in detail—which in the event of a backfire occurring throw the crank free of the sprocket altogether. In other words the crank can drive the sprocket but the sprocket cannot drive the crank. The contrivance is very cleverly designed, though it did not appear to me to be any too strong for so large an engine. The crank case, it will be noted, carries a fibre-headed stop, against which the pedal is returned by an internal spring.

Figs. 5 and 6.—Indian.

The method of clutching up to the engine-shaft is simple and effective. The principle is similar to that of the Rudge, except that, instead of a quick-thread drum, a "tram-way" is employed. This is illustrated in fig. 6. The small chain sprocket—the chain is for some reason a block one of one inch pitch, and, therefore, rather clumsy looking—is supported by an extension of the crankshaft and also by a bush carried by the driving chain case. In this outer bush is a spring ball-headed plunger which runs into the semicircular tramway grooves of the sprocket sleeve. In the normal or "out" position of the sprocket the plunger is in the right-hand line of the tramway, but upon the sprocket being rotated clockwise the plunger runs into the cross-over tramline, which is cut much deeper than the other and so propels the clutch sleeve sideways into engagement. When the engine fires, the ratchets force one another apart, with the

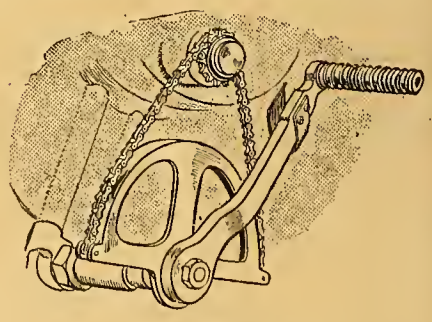


Fig. 7.—P. and M.

result that the plunger jumps from its tramline across the track into the right-hand one again, being helped in this action by the cross-over line into which it is brought upon the release of the pedal. The pedal stop is so arranged that

Foot-starters.—

the tramway comes into action immediately pressure is applied by the foot.

When the engine is running all the parts of the starting gear are free.

A Simple Starter.

One of the simplest forms of starter is the P. and M., a sketch illustrating the general arrangement of which is given in fig. 7.

Fixed immediately underneath and behind the crank chamber is a bracket which carries a semi-circular drum, to each end of which is anchored a short length of chain which passes over a small sprocket runing loosely on the crankshaft, which is slightly extended for this purpose. This sprocket has a free-wheel at the side of the sleeve, of which it forms a part, the teeth of this being considerably undercut, so

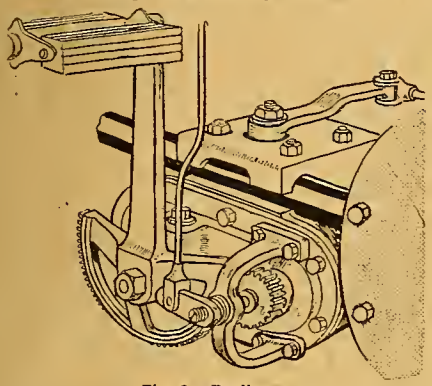

Fig. 8.—Bradbury.

that when driving the engine the teeth of the sprocket ratchet force themselves into engagement. Normally they are held out of engagement by a small spiral spring. The pedal crank of the chain drum is, however, arranged so that when it is out of use it lies a little above and beside the sprocket, opposite which is fitted a U-shaped spring blade, which, as the pedal is forced downwards, presses against the end of the sprocket and forces the teeth of the ratchet into engagement. When the engine has started these teeth cannot, of course, engage, so that on its return stroke

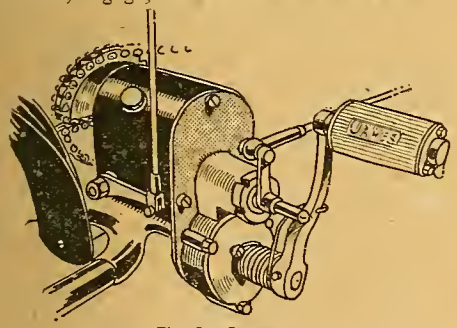

Fig. 9.—James.

the pedal passes freely by the sprocket, and when back to its "home" position everything runs clear and free

The commonest place for the foot-starter is to be mounted upon the counter-shaft gear box, examples of which are to be found in the Bradbury, James, Douglas, Clyno, and Calthorpe machines, and also in the Bowden counter-shaft gear box, which has already been fully described in *The Motor Cycle*.

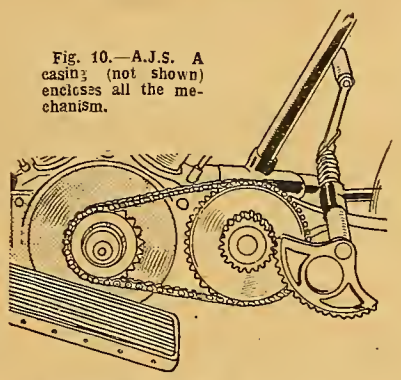

Fig. 10.—A.J.S. A casing (not shown) encloses all the mechanism.

Fig. 8 illustrates the Bradbury device. In this case the primary gearshaft is extended through the non-driving side of the gear box, and supports a loose gear pinion, on the side of the boss of which is an undercut ratchet engaging with a similar one fixed to the gearshaft. A small spring serves to throw them into action when the gear pinion is rotated by the starting pedal, which is attached to and forms

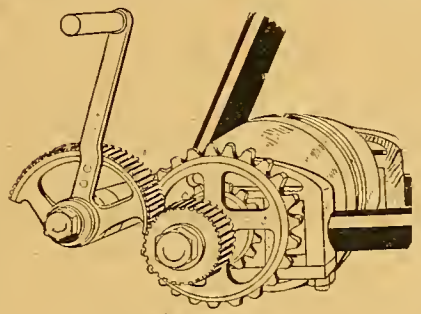

Fig. 11.—Clyno.

part of a semi-circular rack, supported by a special bracket cast on to the gear box. The pedal is operated by a downward and backward kick, and returned to its normal position by a spiral spring.

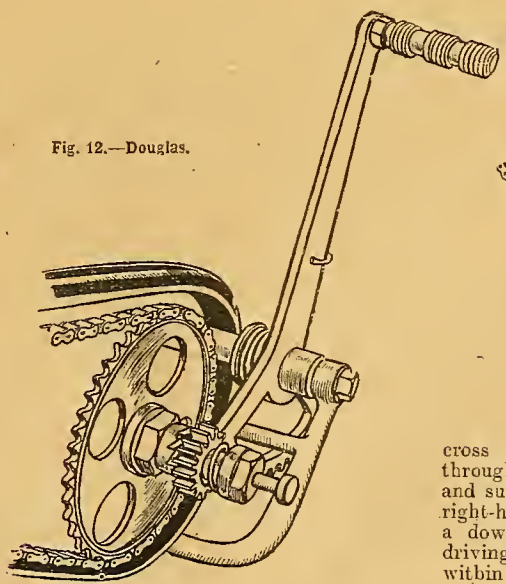

Fig. 12.—Douglas.

Enclosed Gearing.

The James starting mechanism is shown in fig. 9. Here the side of the gear case is prolonged downwards to form a housing for an enclosed driving pinion, and an intermediate pinion meshing with a pinion carried on the end of the primary gearshaft (which is also the clutchshaft). The driving pin is connected to the pedal-shaft by an ordinary circumferential free-wheel, the crank being returned by a spring. The ratio between the pedal pinion and the engine is about 3 to 1. It will be noticed that the pad of the pedal is furnished with pendulum weights to keep it always floating in the right position for the foot. It need hardly be said that the James starter is worthy of the greatest praise for one fact above all others, namely, that it is one of the only two which are adequately protected both from rain and

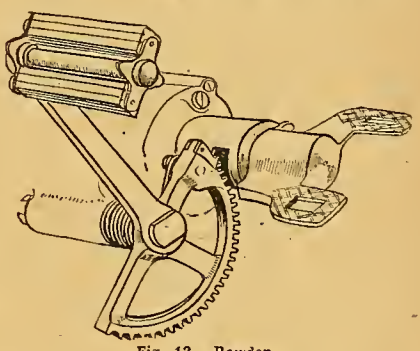

Fig. 13.—Bowden.

mud, and also from the liability of mangling overalls and bootlaces. In starting the James a forward kick is used.

The other protected one is the A.J.S. (fig. 10), which also applies to the chain-driven counter-shaft, which carries on its extreme outside a gear pinion engaged with an ordinary free wheel. This pinion is driven by a ratchet sector, carried by a

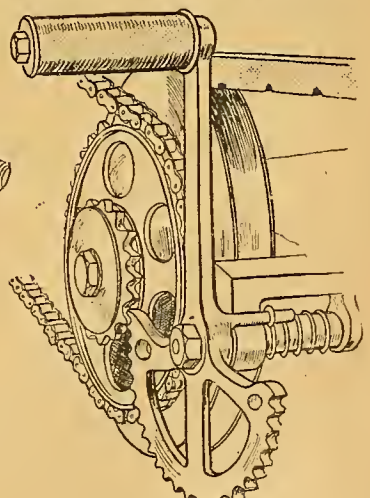

Fig. 14.—Calthorpe.

cross shaft, which passes as it were through the bottom bracket of the frame and supports a spring loaded pedal on the right-hand side. This is operated with a downward and backward kick. The driving pinions of the above are contained within the counter-shaft chain case.

Foot-starters.—

The Clyno arrangement is shown in fig. 11, and is applied to the chain-driven bottom bracket counter-shaft. This carries a gear pinion, beside which is a ratchet with slightly under-cut teeth. The starting pedal, which is to be pressed backwards and downwards, is fixed to a semi-circular rack, which is quite clear of the pinion when the engine has started and the pedal has been returned by its spring. It is carried in an eccentrically mounted bush, thus providing an adjustment for the gear when the counter-shaft chain has to be tightened. To make this bracket as strong as possible, it is further supported by an outside stay from the frame.

Fig. 12 illustrates the Douglas device, which after the previous explanations is sufficiently obvious. The pedal, to which is attached a crank and rack, is kicked backwards (the step appears to be rather on the small side), and drives a ratchet pinion on the primary gearshaft. The pinion and rack are completely free of one another when the engine is running.

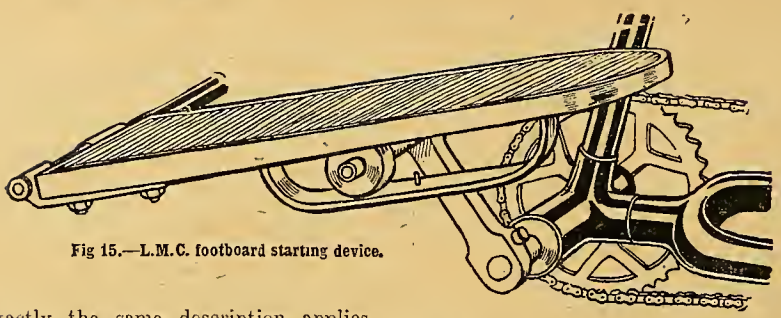

Fig 15.—L.M.C. footboard starting device.

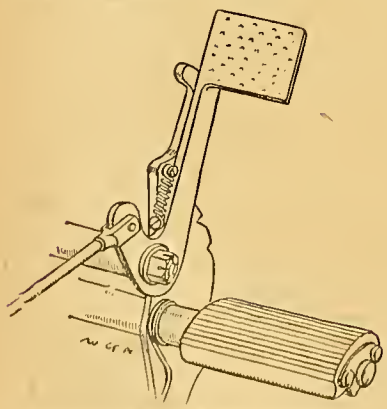
Exactly the same description applies to the Bowden (fig. 13) and the Calthorpe (fig. 14). In the former, the pedal rack springs clear out of engagement with the covered-in pinion on the engine-shaft, and in order to make re-engagement the less harsh is furnished with a spring tooth, whereas in the latter the rack and pinion are always in engagement.

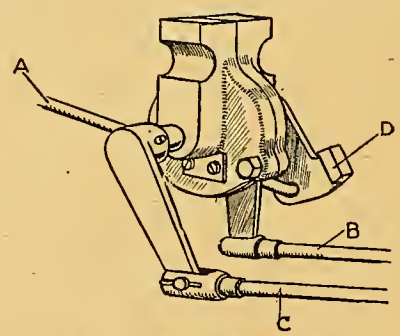


Another Method.

The L.M.C. foot-starter is more a method of using footboards instead of pedals than anything else, though in its way it is extremely effective, although, of course, unless a special hub be fitted it requires the back wheel to be jacked up clear of the ground.

The drawing (fig. 15) makes its construction easy to understand. The left footboard is hinged in front, and drives an ordinary sprocket wheel through a crank, by means of a metal roller running between guides. It is obvious from the construction that a very large leverage is obtained.—W.G.A.

PEDAL CONTROL OF THE BROWN & HINGSTON GEAR.

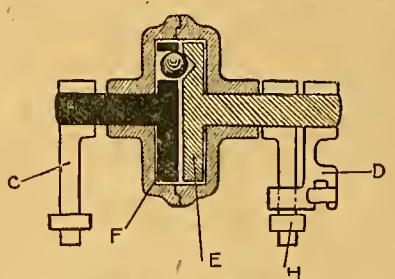


This gear, the mechanism of which was illustrated and described in our issue of October 26th, page 1128, has recently had embodied in its design an ingenious and simple form of control. In this gear there are two clutches, one a band brake for holding a portion of the epicyclic gearing stationary (and so being in effect a low gear clutch), whilst the other is a metal-to-metal clutch which is used solely for the high gear. These clutches are separately worked—one on one side of the hub, and the other on the other. It is, therefore, not an easy matter to devise a simple form of single pedal control to operate the two movements at one time. However, the designers have overcome all difficulties, and have devised a neat contrivance which accomplishes the end.

Operating pedal of the Brown & Hingston gear.

The first sketch shows the single pedal control, provided with a ratchet catch working over a quadrant fixed to the footrest rod, and partially held in position by the silencer bracket. It will be understood, of course, that this quadrant can be adapted to meet the requirements of any machine.

The rod proceeding from the shorter arm of the bell crank is shown as A in the second sketch, and is connected to a lever, which is provided with a trip catch, and which, as will be shown, can be



B. & H. two-speed gear operating rods.

used to operate either the rods B or C, the former being for the low gear clutch, and the latter for the high gear clutch. These levers are pivoted on rods which pass through a hollow box, a section of which is given in the third sketch. The trip lever D is connected to the disc E, whilst the lever C is in one with the disc F. These discs are not connected to one another, except as in the manner to be described, and are quite free to revolve with the levers. The lever H, which carries the rod B, hangs free on the shaft which connects the lever D to the disc E. The disc E has a conical depression in it opposite to a hole drilled through the disc F, and these two discs are held together by a ball which is placed between them, as shown, and is prevented from coming out of engagement by the left-hand wall of the box.

The normal position is for the direct driven, high speed to be engaged, this being accomplished by a spring inside the hub. The first movement of the gear pedal obtains free engine by the following means. The lever D is locked to the crank of the rod C by means of the two discs and the ball, and accordingly when the gear is in high-speed position pressure on the pedal puts the gear into free engine, the lever C withdrawing the high gear clutch.

The next movement of the pedal is, of course, to engage the low gear, but it is necessary in this connection to ensure that the high gear clutch is held out of engagement. When, in obtaining free engine, the gear pedal is moved to a certain point, the hole in the disc F containing the ball comes opposite a conical depression in the left-hand wall of the box, and since the pedal is applying pressure to the lever D, the result is that the ball is forced sideways by the sloping sides of the depression in the disc E, and in doing so locks the disc F to the wall of the box. This prevents the rod C moving, and the high gear clutch is accordingly held out of engagement. In the meantime, the ball having left the depression in the disc E, the lever D is free to continue its movement, which it does when the control pedal is pressed further forward beyond free engine position. In these circumstances the trip lever D engages with the loose crank H, and operates the low gear brake drum through the lever D. In passing from low to high gear the operations are, of course, exactly reversed.

A New Method of Repairing Outer Covers.

WHAT is claimed to be a certain and permanent method of repairing small holes and bursts in tyre covers has been introduced by Brown Brothers, Ltd. The Sampson plug or clamp, which is the invention of a Canadian of that name, has been in use for some years in the United States and Canada, and although the idea of clamping cuts and bursts in covers was ridiculed when it was first introduced, over 200,000 per month are now being used, which is a proof of efficiency. The clamp holds the edges of a cut together and covers small holes.

The Sampson plug for repairing tyre cuts.

The device consists of a plug varying in size according to the extent of the cut or hole which is to be repaired. The plug has attached to the centre of it a screwed wire which is bent to form a lever by which it can be turned. Screwed on the wire is a metal washer coated with rubber. To fit the plug the washer is unscrewed and the wire inserted through the hole or burst from the inside of the cover; the washer is then screwed down the wire to the outer surface of the cover and can be tightened down on to the rubber by turning the wire to the left, until the washer is embedded in the tread. The wire is then broken off by nicking it close to the washer with a file and bending it backwards. In the case of long cuts two or more of the plugs may be used at intervals. The device may be seen at 15, Newman Street, Oxford Street, W

The Nominal Horse-power of Motor Cycles.

SURELY it is time that we cease to call the popular single-cylinder machine of the day 3½ h.p. It has been 3½ h.p. for some years now—in fact, ever since it was a baby—and has been getting larger and stronger ever since. This being so, it is time it went into knickers, as it were, for it is a baby no longer. Why not call it by its cubic capacity, or divide the different sizes as they do at Brooklands, calling one a Class A motor cycle and another Class C? This would be much better than lumping machines of varied capacity together under the not even approximate title of 3½ h.p. The most popular size is probably 85 × 88 mm. The horse-power of this size is variously given as follows:

The calculations are made in centimetres reckoning 2,000 revolutions per minute, except in the S.M.M.T. and Lanchester formulæ, where the inch is the unit.

R.A.C.	$\frac{D^2N}{16}$	4.55
Dendy Marshall	$\frac{D^2SN \text{ revs.}}{200{,}000}$	6.36
Hospitalier	$\frac{r^2SN \text{ revs.}}{75{,}000}$ (r = radius)	4.24
S.M.M.T.	$.197\,D\,(D-1)\,N\,(R+2)\;R=\frac{S}{D}$	4.7
Rüde	$.006\,D^2SN$	3.82
Coventry and Warwickshire M.C.	$\frac{D^2\sqrt{s}\,N}{18}$	3.76
Lanchester	$\frac{.5\,D^2N}{\sqrt{\frac{1}{R}+.3}}$	5.0
Poppe	$\frac{DSN}{16}$	4.67

It may be inconvenient for makers to test their engines on the brake and give us the b.h.p. in their catalogues, a consummation devoutly to be wished, but I contend that every maker can and does make an engine which, in the usual motor cycle sizes, is capable of giving 1 h.p. for every 100 c.c. capacity, and that in ordinary touring trim. What these engines are capable of when specially tuned up and adjusted to give their utmost power for limited periods is little short of marvellous, and can be arrived at by simple calculations. Some years ago I rode a 3 h.p. motor cycle having an engine 75 mm. bore by 80 mm. stroke, 353 c.c. Now if this engine could develop 3 h.p. in 1905, and it most certainly did, what can be said of a modern engine of 200 c.c. more which only develops 3½ h.p.? Of course, we all know that it is far more powerful than that, therefore, as Ko Ko once remarked, "Why not say so?" One well known engine is said to give 7 h.p. on the brake, and I can well believe it, judging from its performance on road and track. This engine is the popular 499 c.c. size, and it gives this power in touring trim. When specially tuned up, I should be rather afraid to say what it does give even if I produce "corroborative detail to give verisimilitude to a bald and unconvincing narrative."

Cost of Running a Motor Cycle.

A Selection of Replies to a Reader's Query.

See also pages 1197, 1247, 1318A, 1357, 1380, 1422 (1911), 5 (1912).

Sir,—The following may be of interest from the fact that it includes the running of an ordinary push-cycle attached to a motor cycle:

Capital outlay—

Second-hand 3½ h.p motor cycle and driver's licence	£28 15 0
Lady's ordinary second-hand bicycle	7 0 0

	£	s.	d.	d.		
Carbide		3	4	= .02 per mile		
Oil, lubricating, 7 qts. ...		8	6	= .05 ,,		
Petrol, 23 galls.	1	6	5	= .18 ,,		
General repairs, tax, and proportion of cost of one suit of overalls	3	0	0	= .40 ,,		
Tyres: Retreading one cover and proportion of new one	1	5	0	= .17 ,,		
Belt, proportion of new one		5	0	= .04 ,,		
				.86 ,,	£6	8 3
Lady's cycle (ridden 1,000 miles): Proportion of new cover, repairs, and coupler				= .36 ,,	1	10 0
				1.22 ,,		
Total running expenses ...					£7	18 3
22% depreciation on motor only... Lady's machine too old.				.80 ,,	6	0 0
				2.02 ,,		
Total cost for season's running					£13	18 3

Miles run: Motor cycle, 1,800; lady's cycle coupled, 1,000.
Consumption: Petrol = 78 m.p.g.; oil = 1,040 m.p.g.

REGD. ALLENBY.

Sir, — The letters from readers appearing in *The Motor Cycle* on cost of running a motor cycle are very interesting though divergent in the various estimates, yet there is one noticeable feature in them all. None of the writers refer to the train fares that they save by this means of travel. Surely before entering the arena of motor cycling, the writers would have to travel by train, hence though their estimates of cost of running may be correct, are they not to allow some credit for what has previously been spent on train fares? C.M.

Sir,—As I have seen weekly in your most excellent paper various opinions as to the running cost of a motor cycle, may I be allowed to give mine? My machine is a 1910-11 Douglas. I have run last year 4,972 miles at a cost of £17 6s. 6d. My chief trouble during that period was tyres. The ones fitted to the machines originally are now replaced by a Michelin on front and Palmer cord on back. Both tyres are perfect and will run all this year; also I have had two tubes which should not have been necessary. My chief trouble was leaking butt-ends. Never again butt-ends for me. I have also included £6 for depreciation. Repairs to the engine are nil, and the expenses under this head are two inlet and exhaust valve springs, also a tin of grinding powder and getting valves trued up on lathe.

Mileage run, 4,972.	£	s.	d.
Tyres and tubes	3	8	8
Engine		3	4
Two belts and fasteners	1	10	11
Petrol and oil	3	1	1
Extras		1	6
Sundries	1	15	0
Depreciation	6	0	0
Licences	1	6	9
Total	£17	6	6

Cost per mile = .836d.

I see in the issue of December 28th "A.F.W." can only manage 1.42d. per mile for a greater mileage than mine.

A. E. W. WEMYSS.

Sir,—Seeing that several readers of your valuable journal send the running costs of their motor cycles, I would be pleased if you could include mine. The machine is a 1910 F.N. 2¼ h.p. two-speed shaft-drive. I am middle aged (about fifty), and my average speed is about twenty miles per hour with an occasional burst on open roads up to thirty-five miles per hour. My expenses for tyres are rather heavy, as I have only just fitted new ones at an outlay of £3, and only used the machine eighty miles since.

Cost of running a 2¼ h.p. two-speed shaft-drive F.N. 4,926 miles, thirty-six gallons of petrol (140 m.p.g.), five gallons of lubricating oil—

Tyres, new last month	£3 2 0
Licences	1 5 0
Engine, frame, and fittings	2 6 9
Plug	3 6
Petrol and lubricating oil	3 3 4
Extras, new lamp, cyclometer, overalls, etc.	2 13 9
Total expense	£12 14 4

Approximate cost, ½d. per mile. A. POTTERER.

Sir,—The following statement of running expenses of a 1910 (July) P. and M. during 1911 may be of interest:

Clothing, taxes, and insurance	£7 5 11
Equipment (head light, parts, etc.) ...	4 14 7
*Tyres, tubes, and repair outfit	7 2 4
Oils, carbide, and chain grease	1 11 2
Repairs and renewals	7 15 6
Petrol	6 18 10
Depreciation, say	10 0 0
	£45 8 4

*Both the covers on the bicycle are practically new, and will run on well into 1912, but I have counted the whole cost of them in this statement.

From January 1st to December 31st the machine ran 7,365 miles solo and 1,946 miles with a sidecar, making a total mileage of 9,311. Therefore the total cost works out at under 1½d. per mile, which, I think, is very good.

The petrol expenditure is unduly high, owing to twenty-six "centuries" run "on the Continong," where, as you know, "essence" is from double to treble the price it is in England. SKY PILOT.

Sir,—Herewith I beg to send you particulars of cost of running a 5-6 h.p. four-cylinder F.N. (494 c.c.) with sidecar; weight with passengers about 700 lbs.

Mileage (period, May 19th to December 31st, 1911)—

Solo (single gear)	100	miles (approx.)
With sidecar (single gear) ...	2,700	,, ,,
With sidecar (two-speed gear)	400	,, ,,
Total as per cyclometer	3,300	,, ,,

Petrol consumption = 66 miles per gallon.

Capital account—

Motor bicycle	£52 10 0
Sidecar complete	8 7 6
Two-speed gear	10 10 0
Motor house (10ft. × 7ft. × 6ft.)	9 0 0
Extras on machine	5 17 0
Total	£86 4 6

A summary of my expenses is as follows:

				Pence.
Tyres and tubes ...	£6 7 0	on 3,300 miles	=	.4 9
Petrol	4 5 8	,, ,, ,,	=	.311
Engine and ignition ...	11 4	,, ,, ,,	=	.041
Transmission	2 1 9	,, ,, ,,	=	.151
Extras	3 7 3	,, ,, ,,	=	.244
Licences	1 15 6	,, ,, ,,	=	.129
Depreciation	5 16 0	,, ,, ,,	=	.421
Total ...	£24 4 6	Total per mile		1.736

With regard to the depreciation costs, since these machines wear so well, I consider that 20s. per 1,000 miles is ample, if not too much. FRITZ C. SCHOVE.

CURRENT CHAT

TIME TO LIGHT LAMPS.

January 18	...	...	5.20 p.m.
,, 20	...	...	5.24 ,,
,, 22	...	...	5.27 ,,

North-west London-Gloucester Run.

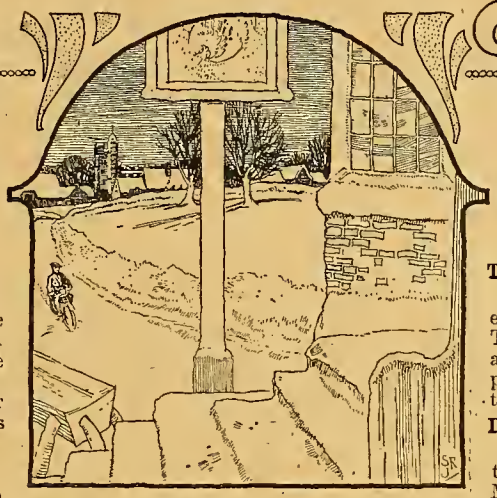
The machine ridden by J. Beal in the above twelve hours' trial was a 3 h.p. twin-cylinder N.S.U. fitted with the firm's two-speed gear.

A. V. Deacock, who won a silver cup in the London-Gloucester Run, was mounted on a N.L.G.

Auto Cycle Union.

A lantern lecture, entitled "Speed and Power," will be given on the 1st prox., at 8 p.m., at the R.A.C. Associates' Room, 89, Pall Mall, S.W. The secretary of the A.C.U. will be pleased to send any reader a ticket of admission.

French Reliability Trial.



Our French contemporary *L'Auto*, which is always to the fore in organising motor car, pedal cycle, and athletic events, will organise a big motor cycle trial this year, the date of which is not yet decided.

Beach Racing in Yorkshire.

Motor cycle races have been suggested on the fine stretch of sands at Saltburn-by-the-Sea (Yorks). The Yorkshire A.C. holds speed trials there every year for cars, and high speeds are attained. The 200 h.p. Darracq is credited with 121 m.p.h. over a measured kilometre. In addition, going to and from the sands, there is a sporting hill with S bends which would make a good test hill if it was decided to run a speed trial and a climb together without change of gear. Secretaries of adjacent clubs and others who are interested should write Mr. J. H. Baines, Mayhouse, Saltburn, who will be pleased to assist or provide further particulars.

Hotel Keepers and Motor Cyclists.

During the hot weather last summer, two motor cyclists entered an hotel, which held the A.A. and M.U. appointment. The travellers were dusty and travel-stained, and on their asking to be served with tea, the proprietor told them they were too dirty to be served, although one of the motor cyclists mentioned that they intended to remove their overalls before entering the coffee room or sitting down to their meal. The motor cyclists naturally resented the tone used towards them, and the landlord then insulted them, and forcibly ejected one of them from the house. The one who was ejected could have probably summoned the proprietor for assault. However, the matter was reported to the A.A. and M.U., who took it up strongly with the proprietor of the hotel, and after the report had been gone into by the A.A. and M.U Committee, it was decided to cancel the appointment. The A.A. and M.U. are to be congratulated for taking up the matter successfully.

The T.T. in America.

The British Tourist Trophy, won by O. C. Godfrey, was exhibited on the Hendee Manufacturing Co.'s stand at the New York Show, which closed last Friday. It is being transported to the Chicago Show.

Silver Medal Winners in the Exeter Run.

The winners of silver medals in the M.C.C. London-Exeter and back run are: S. Browne (3½ h.p. James sc.), A. Mabon (3½ h.p. Rudge sc.), S. Sawer (3½ h.p. Premier), and F. Thomas (7 h.p. G.O.K. sc.).

A New Form of Winter Sport.

The latest invention in the form of winter sports is the "Bicycle Luge," of which we give an illustration on this page. A Swiss reader, in sending us the photograph, says: "The speed up to which it will travel is 60 to 70 m.p.h. on a good run. The steering is the same as an ordinary cycle, and corners may be taken with ease. Brakes are not necessary, as one can stop easily by dropping both feet to the ground. The rider's feet are supported by a crossbar, extending right and left of the frame. It is steadily gaining favour amongst the English people in Switzerland."

The "Bicycle Luge," which has a diamond frame of wood.

SPECIAL FEATURES.

STREAMLINE BODIES.
A Novel Suggestion.

THE CUT-OUT AGAIN.

THE HORSE POWER OF MOTOR CYCLES.

This Year's T.T. Race.

The French daily sporting press is enthusiastic over the idea of running the Tourist Trophy Race in France this year, and urges French manufacturers to prepare themselves in the event of the race taking place there.

Dieppe or Douglas.

We hear that with about two exceptions the whole of the members of the Manufacturers' Union have signed the bond not to compete in a T.T. race in the Isle of Man. It would therefore appear that even if the A.C.U. obtain permission to hold the race in the Isle of Man it will have little or no trade support. The signing of the bond does not prevent makers taking part in a similar race if it be held elsewhere, say in France. *Vive la France!* It looks as though we shall have to polish up our French for this event.

Tour on the Continent.

An interesting lecture was given on the 9th inst. by Mr. H. Meyer, the editor of *De Kampioen*, a Dutch motor cycle journal. The subject was a recent tour taken by the lecturer and Mr. W. W. Douglas, which, starting from Arnheim on October 3rd, extended through Germany, Switzerland, and Italy, as far as Bologna. The Alps were crossed several times by the St. Gothard, Simplon, Mont Cenis, and Tenda passes. On the return journey the coast was followed to Marseilles, from which place Paris was reached in two days. The machines used were 2¾ h.p. two-speed Douglases.

Brooklands and the Six Days' Trials.

Messrs. the Stewart-Precision Carburetter Co. have read with interest our suggestion regarding the finish of the Six Days' Trials at Brooklands, and noticing the chief objection of the Auto Cycle Union to the scheme, namely, that of expense, they have generously offered to guarantee the Union against any loss resulting from the engagement of the track. We think it would be impossible for any firm to have come forward with a more generous and sporting offer, and we sincerely hope that now the principal objection has been removed, the A.C.U. will see fit to fall in with the idea. In the event of the offer being accepted, the Stewart-Precision Carburetter Co. will deposit the sum of £25 with *The Motor Cycle*.

At a meeting of the Manufacturers' Union, which was held in London last week, the question of transferring the final day's run of the Six Days' Trials to Brooklands was discussed, and received the approval of the majority of those present. Surely the arrangements at Taunton cannot have progressed so far as to prevent this very sporting offer of the Stewart-Precision Carburetter Co.'s being accepted by the A.C.U.

The Number of Motor Cycles.

A careful estimate based upon official returns places the number of motor cycles at present in use in the British Isles at 63,000 (see page 60).

The Proposed Reliability Trial in France.

Matters are taking shape for an international reliability trial in France at Eastertide. The suggestion is to hold a two days' trial, one day being devoted to the reliability test, the other to a sporting hill-climb.

Globe-girdlers on Motor Cycles.

Wm. Strieff and Joseph Esler, the American tourists mounted on a N.S.U. and Indian respectively, who were in England last summer, are at present touring through Europe, and were recently entertained by the N.S.U. and Peugeot Co.'s.

International Motor Cycle Race in America.

There is a movement on foot in America to promote a two-hundred miles international sweepstake on the Indianapoli Course. The promoters hope that the F.A.M. will support the scheme by holding a race meeting jointly with the event.

The Wintry Weather.

A non-stop run from London to the Glasgow Show was arranged for the beginning of this week on a 3¾ h.p Premier sidecar with a member of our staff as passenger, but the severe weather and deep snowdrifts up North rendered the ride quite impossible.

Liability of Road Authorities.

We are constantly receiving queries regarding the liability of road authorities. Therefore a decision of the Swansea County Court should be noted. The case was that of a motorist who was awarded damages against the Glamorgan County Council for injuries caused to his vehicle through a portion of the road between Swansea and Mumbles being improperly repaired after an excavation. The case was fought by the A.A. and M.U., and the Judge apparently attached considerable importance to the fact that the defendants could not call evidence as to the condition of the road immediately after the accident, and that after the matter was reported to them the hole had been properly filled in. This decision should benefit all road users.

A Brooklands for Berlin.

Germans are fertile in projects that fail to materialise; consequently we take the liberty of contemplating with the eye of scepticism a scheme to construct, at the Berlin-Johannisthal flying ground, a three-mile track, or, to be more precise, a circular course over which push-cycle and motor cycle races could take place, notwithstanding that we are assured of the construction being taken in hand early in April. Bankings would hardly be necessary, in view of the great radius at the turns. Whatever becomes of the scheme, there is no doubt that cycling Berlin stands in great need of a course of the kind, the opposition of the authorities to road events, more especially those concerning the mechanically-propelled machine, helping in a large measure to keep down a sport already handicapped by a severe liability law and vexatious licensing arrangements.

An Enthusiastic Trio.

Ever since Harry Bashall witnessed Sam Wright reel off laps at Brooklands at sixty miles per hour, he has hankered after one of the little twin Humbers. He and his youngest brother A. B. T. have just got one each, and they are having a tiny little sidecar fitted to one of them.

J. T. Bashall is contemplating a twelve hours' ride on his record-breaking Bat sidecar early in the spring.

English-Dutch Reliability Trial.

Entries continue to reach us for the above trial. Mrs. Wade, of Cardiff, is the second lady competitor. She will ride a 3¾ h.p. Scott. Further amateur entries are André Manheim (T.A.C. sidecar). E. B. Ware (Chater-Lea sidecar), and Richard Cussons (3½ h.p. New Hudson). The latest trade entry is F. C. North (3½ h.p. Ariel). R. G. Mundy will ride a 2½ h.p. two-speed Singer if chosen.

FUTURE EVENTS

Jan. 20.—Herts. County A.C. Open Trial.
" 20.—A.C.U. Annual Dinner.
Feb. 17.—Sutton Coldfield A.C. Open One Day Trial.
Mar. 2.—A.C.U. Open One Day Trial.
" 23.—B.M.C.R.C. Race Meeting.
" 30.—Derby and District M.C.C. Open Hill-climb.
Apl. 5-8.—N.W. London and Herts. County M.C.C. Joint Trial and Open Hill-climb (Yorks.) and Ladies' Competition.
" 8.—Westmorland M.C.C. Open Hill-climb at Shap Fell.
" 13.—Oxford M.C.C. Open Hill-climb

The Cut-out Abolished.

In view of the amount of space we have devoted to silence and silencers in an earnest endeavour to reduce the noise of motor cycles, it is interesting to note that one large firm, to wit the Hendee Manufacturing Co., has set an excellent example by deciding to abandon the fitting of cut-outs to their machines in future. Let us hope that this is the beginning of the end of the noise outcry.

Illumination of Number Plates.

The *Aberdeen Journal* of the 12th inst. says a motor cyclist was summoned and fined at Elgin, N.B., on the 11th inst. for failing to have the tail lamp of his motor bicycle lighted. Possibly the reporter may have mistaken "motor bicycle" for motor car. If this be not the case, the conviction is a wrongful one, and can be quashed at any time. A summons could only hold good if the defendant had been driving a tricar bearing motor car numbers.

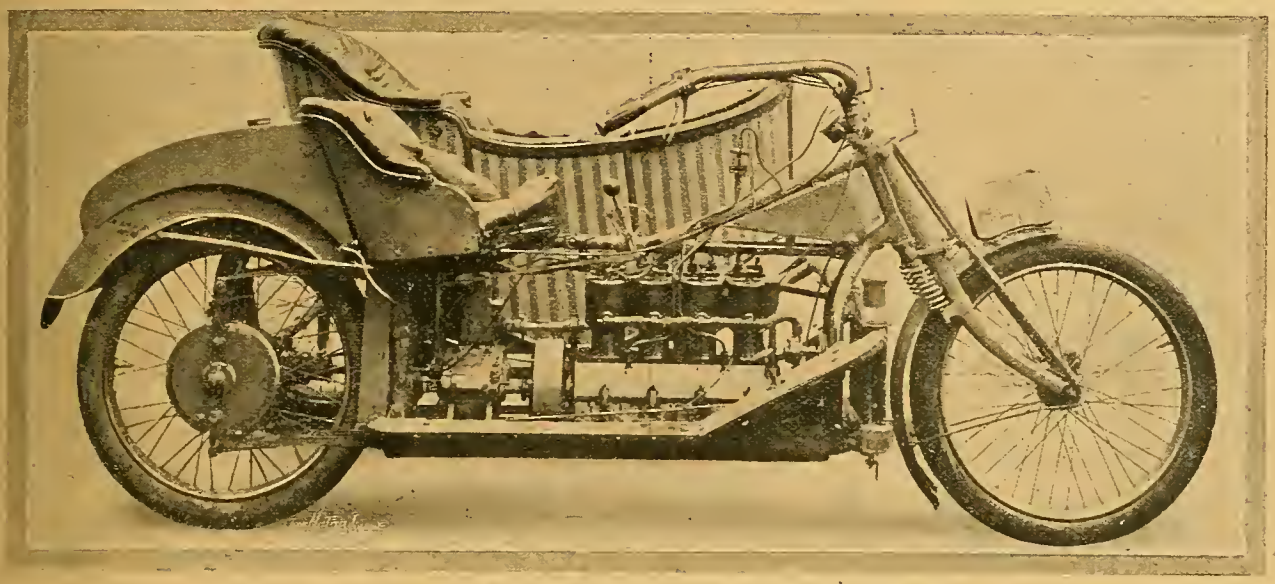
Entries for Saturday's Open Reliability Trial.

The first of the series of four 100 miles open reliability and sporting trials for motor cycles of all kinds, organised by the Herts. County A.C., will be held on Saturday next, the 20th inst., starting from the Chequers Hotel, Uxbridge, at 9.30 a.m. prompt. On account of the large entry, the start has been put back half an hour to ensure competitors finishing in daylight.

The route is *via* Denham Avenue, Rickmansworth, Watford, St. Albans, Harpenden, Luton, Sharpenhoe, Dunstable, Ivinghoe, Tring (lunch Rose and Crown Hotel), Aston Clinton, Wendover, Princes Risborough, Missenden, Amersham, Rickmansworth, Uxbridge.

There will be two timed hill-climbs, as well as an observed ascent of Holywell Hill, St. Albans, at 10 m.p.h.

The series of Herts. County trials will to all intents and purposes fill the gap occasioned by the abolition of the A.C.U. Quarterly Trials, although, of course, private owners will predominate in the Herts. County events.



Entries are as under:

V. Wilberforce (2¾ Douglas)
T. E. Seear (2½ Motosacoche)
J. Holroyd (2½ Motosacoche)
E. A Marshall (S.I.A.M.T.)

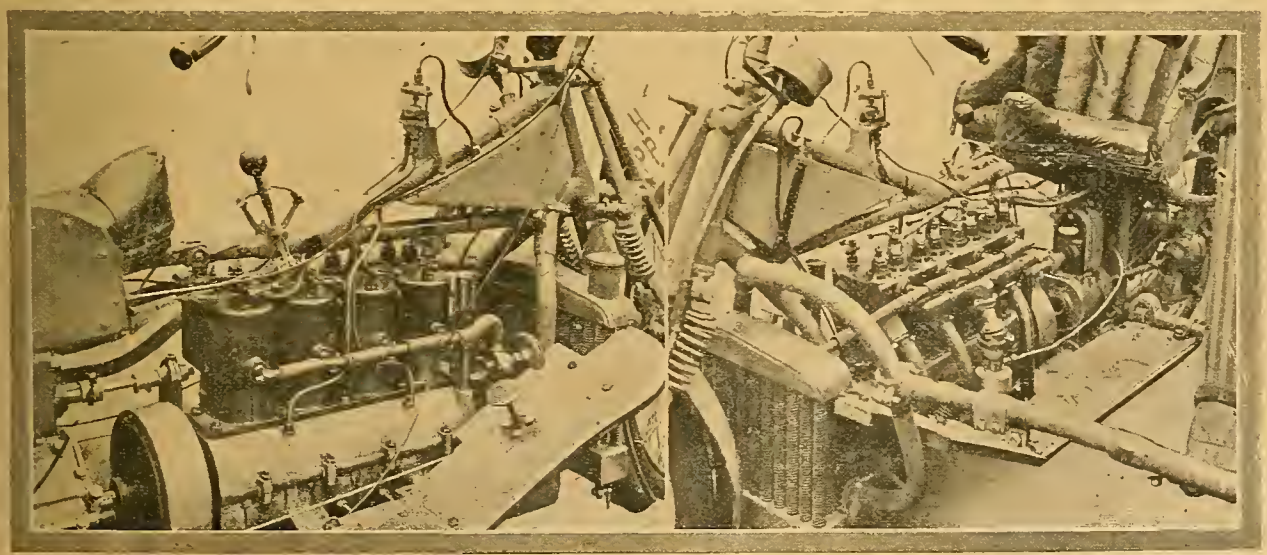
An illustrated description of the trial will appear in our next issue.



THE 1912 MODEL T.M.C.

A New Water-cooled Engine with Mechanically-operated Valves.

The new model four-cylinder water-cooled T.M.C. with coach-built sidecar attachment.

ON page 1352 of our issue of December 7th last we gave some preliminary details of the new 7 h.p. T.M.C. On the occasion of our visit last week to the Wilkinson Sword Company's works, Southfield Road, Acton, we were, through the courtesy of Mr. Kirschbaum, able to see one of the new models undergoing its preliminary road tests. These are almost complete, and in April the first batch of machines will be ready for delivery. The machine being almost complete we were able to see it in practically its final state, and are enabled to elaborate on the description in the article referred to above. The rotary oil pump driven off the camshaft delivers air pressure to the oil reservoir, forcing the lubricant through a sight feed direct to the crank case by two separate pipes leading to the two crank case divisions. Any excess of oil is returned by the pump to the reservoir. The water pump is driven off the camshaft by means of a wire belt. This pump, which is of the gear wheel type, delivers the water to a gilled tube radiator neatly carried in front of the machine. The leather-to-metal clutch, with springs under the leather to allow the drive being taken up smoothly, has its internal portion made of a spring steel pressing. It is provided with six longitudinal equally-spaced slots in its periphery, which cause it to contract when forced into the outer portion and at the same time to exert an internal pressure which ensures a steady grip, and con-

Views of the engine which, as will be seen, has the valves all on one side. The left hand illustration also shows the change speed lever and sight-feed lubricator. The right shows the carburetter and its connections, also the sidecar fixings.

The 1912 Model T.M.C.—

sequently a positive drive. The clutch is provided with three external springs (following car practice), allowing easy adjustment and permitting the clutch to be readily dismantled.

Undergoing a Long Road Test.

During our visit the Stewart Precision carburetter was undergoing its final tuning preparatory to the machine entering on a series of prolonged road tests. The control is arranged as follows: Off side a pedal controlling the clutch and internal expanding brake. On the handle-bar a lever controlling the external contracting brake working on the same drum, which is ribbed and lined with Raybestos, the pedal on being depressed first withdraws the clutch and then applies the brake. Near side, accelerator pedal on footboard, and lever on handle-bar controlling clutch. The object of the hand clutch control is to facilitate starting from rest. With pedal control a rider may upset his balance, inadvertently extend his foot to save himself, and let in the clutch against his will, with disastrous results. The gear sector is brazed on to the top tube of the frame. The gear actuating rod in the gear box is provided with holes in which a spring plunger engages, so that in case of wear on the control rod joints the gears will stay in position independently of the notches on the sector. The magneto, neatly carried on the top of the gear box, is coupled to the end of the driving-shaft (it is gear driven) by means of a sleeve. By undoing one bolt the sleeve may be rotated in relation to the shaft, and the magneto timed with the greatest facility. As far as one could judge from its running at this early stage of its career, the engine gave every indication of being excellently balanced, while its silence and smoothness left nothing to be desired. It was fitted to a T.M.C. sidecar, which is mounted on laminated springs like the bicycle, and reverting to the latter it may be pointed out that by undoing the four spring shackle bolts and the brake connections the rear wheel can be removed quickly and without difficulty for tyre changing. To sum up, the new water-cooled four-cylinder T.M.C. gives every indication of promising to be one of the most luxurious and practical sidecar machines on the market. Our next reference to this ambitious two-wheeler will deal with its behaviour on the road.

THE NUMBER OF MOTOR CYCLES.

WITHIN the last few days it has been stated in a motor cycle paper that the number of motor cycles registered in the United Kingdom is 106,000 odd.

We believe we know the unacknowledged source of these figures, but they are entirely wrong, as may be gathered from the fact that the total number of motor cycles officially returned as paying licence was 48,857 for the year ended 31st of March, 1911.

It is quite safe to assume that since March last a record number of new motor cycles have been registered in comparison with the corresponding period of any other year, but it is equally certain that their number does not amount to anything like 58,000; probably, 15,000 is a considerable over-estimate, as a very large number of 1911 models would have been delivered and registered prior to March 31st.

63,000 Motor Cycles in use.

However, this estimate has been arrived at after careful calculation and comparisons with previous years, so we will assume that there were 15,000 more; that brings the total up to 63,000. This is a very long way short of 106,000, and it is therefore obvious that, if there are 106,000 registered motor cycles in the United Kingdom, somewhere about 43,000 owners are evading the payment of licences. We think we are safe in assuming that the tax-gatherers have not been so lax as to let a revenue of approximately £43,000 slip through their fingers, and we may regard the total of 106,000 as another evidence of the absolute uselessness of figures based upon the total number of registrations issued, for the simple reason that so many of the registering authorities have no record of the cancellation of many of the numbers they issue. Some, we know, keep their registers most carefully, others do not, and, therefore, any totals based upon registrations are hopelessly misleading, as they form no guide to the actual number of motor cycles in use, for our figures based on the official returns show that the alleged total is 59.43% in excess of facts.

Unfortunately the figures are noticed and often seized upon for quotation, without any consideration of verification or accuracy.

A WINTRY SCENE IN THE PEAK DISTRICT.

The above photograph was taken during last week's cold snap.

By W. Fawcett

TO THE TYROL AND BACK ON MOTOR CYCLES

(Continued from page 42.)

A Kindly Swiss Girl.

A drop down to Sattel, with Lake Aegeri on our left, and we were climbing in earnest again. However, the descent came at last, and with it another lovely panorama of Lake Zurich, away down below. We stopped here for some time admiring the view, perched on a bank in the shade of some pine trees.

Once on the lake side, the road to the right was taken, the one on the left leading to a bridge over the lake to Rapperswil. At Lachen we decided to take in petrol, and, whilst I saw to the machines, Grange had his overalls sewn up by the proprietor's daughter, who saw the tear first and very thoughtfully came out with a needle and thread.

Leaving Lake Zurich, we turned to the right, and were on a long, straight road bordered with tall trees. With no town of any importance on our main route, we decided, in the late afternoon, to go a little out of our way to Glarus, and now entered a valley with towering peaks on either side.

Glarus was soon reached, the day's run being seventy-five miles only, but the odd half hours we spent in admiring the scenery, a bumpy road, and the difficulty of finding the way, made the run seem long. We stayed at the Hotel Eidgenossen, which we found rather dear, but good.

Next morning—Friday, 21st July—we set off to retrace our steps a bit, and Grange, having lowered his gears, set off with a roar, whilst I was hot on his heels when my engine started misfiring, until I put in a new plug, and, although there seemed nothing wrong with the old one, the trouble was cured straight away. The descent was very twisty, but the view superb, and down below in the distance, on our left, like a shining emerald, was the romantic Lake Wallen.

Sargans was quickly reached, and a little further on Bucks, where, crossing the Rhine, we went through a barn-like bridge, and nearly ran over a customs officer, for we had just left Switzerland, and were now in Austria.

C.T.C. Unrecognised in Austria.

We walked into the Customs House, where another officer took our C.T.C. tickets, which were separate ones for Austria, and began to fill in particulars on a form. When he came to the words on our tickets, "Motor Zweirad," he suddenly stopped, went outside, where the other officer had, meanwhile, affixed seals to our machines, and began shaking his head. At last we understood that our tickets were of no use, for, he said, the C.T.C. was for cyclists, and not motorists. In vain did I try to explain that we had paid £7 for the two of us to the secretary, to be returned when we got our papers discharged, but it was of no use. Then an idea seemed to strike him, for, sitting on the steps, he folded his arms and said: "Tuff! tuff! Sh! sh!" As Bucks was only a few yards off, and we had just passed the station, it seemed quite likely to associate his behaviour with playing at trains. At last we understood that if we went to the Frontier Customs Officer at the station he might let us through.

At the station we were lucky in finding a very decent fellow who could speak fairly good English, and we tried to get through without paying duty, but after half an hour it was of no avail, so we returned to the first Customs House and paid about £9 in duty, which, we were told, would be returned at any Frontier Customs House we cared to leave by.

Seals were re-affixed, and pieces of very stiff cardboard were given to us for the Matchless and Bradbury, about six times the size of our number plates, bearing the numbers ZWI 540 and ZWI 541.

This incident having taken a very long time, we decided to spend the night at the next place of any importance. The road was very bumpy and loose, and soon finding Grange was not following, I waited, then returned, and found him with his back wheel out, putting in a new inner tube, having had a puncture and run out of solution. This done, we again set off and soon came to Feldkirch, with a short bridge over a deep cleft, and a river swirling below. Up and down the main street of this quaint Austrian town we rode looking for an hotel, until someone in buttons raised his hat, and, looking up, we found the Hotel de la Poste et d'Angleterre, where we decided to stay. Only fifty-five miles to-day, but it seemed a long run and full of interest.

Steep Hills and Lowered Gears.

Next morning we had breakfast with an American who was driving a Packard car, and had been to see the Stelvio. I think what impressed him most, and ourselves for that matter, was that he had been halfway up the pass, and in returning had to reverse on twenty-two corners out of twenty-four to get round, so it could have hardly been a joyful ride.

Requiring petrol, we stopped at the first shop—it was a small garage—and both filled up. The owner was quite interested in our machines, and a statement that the machines were capable of a speed of 60 m.p.h., if properly tuned up and the conditions were all right, brought an incredulous smile to his face. Taking us to a corner of his workshop, he showed us parts of an engine he was making. We had great difficulty from laughing outright, for he had a connecting rod with tremendous ball bearings, whilst the little end holding the gudgeon pin was *welded* on!

To the Tyrol and Back on Motor Cycles.—

We followed the river out of the town, then turned to the right over a bridge, and were soon in country that must have lately been swept by flood, for there were tree trunks and driftwood all over the fields. We were now making for the Arlberg Pass, and the mountains on either hand were impressive.

The road began to rise gradually, and on a short steep patch I pegged out, much to my astonishment and Grange's amusement, who lowered his gear and smiled knowingly the while I reluctantly cut my belt and lowered my gear from 4⅓ to 1 to about 4¾ to 1; this was the first time I had touched my belt or lowered my gear since leaving home, and although the pass did not appear so stiff, on taking a backward look it seemed a hill indeed. At Stuben I could see a nice mix-up of twisty zigzags up the mountain side, and again decided to reduce my gear to 5¼ to 1. We adjourned to the hotel at the summit and had a nice cool lemonade each. For the descent we raised our gears, and soon met a car slogging slowly along uphill with steam coming from the filler cap four feet high; then another one was passed with a horrible smell of burning brakes. A nice stretch of perfectly straight road through fine trees, with the peak of a mountain at the end, now came into view.

Hereabouts the Arlberg Railway leaves the bowels of the earth, and was our companion at intervals for several miles.

A small stream may be noticed near the summit of the pass, and it is more than interesting to watch it gradually swelling until a few miles down it is a swirling torrent, and in parts appears to be nothing but foam. The scenery is magnificent. The road does not descend as quickly as the river, and in one place in particular, where the river is joined by another, it is spanned by a magnificent single span bridge; the sight from a great height up as one looks over a wall bordering the road is one not easily forgotten.

A turn to the left at Landeck, then a straight run to Imst, where we decided to fill up with petrol, six kronen, or about five shillings, being charged for a gallon and a half. Soon after leaving Imst I passed Grange running with his belt slipping, and noticing later he was not following I returned, and found him putting a new butt-ender in, as the one he had been using was splitting all the way round, presumably where it had been folded in his box.

(A) A halt at a village shop near Langnan, Switzerland. (2) At the bottom of the Arlberg Pass Austria. (3) Old castle on the Brenner Pass, Tyrol. Note the sign in foreground warning tourists of the dangerous corner.

Help for the Helpless.

We met a perspiring individual pushing a very old crock with the front tyre flat. The poor chap was nearly wet-through with pushing on this hot day, so we took out his tube. Oh! dear! what a tube! If it had one it had quite twenty-five patches all ready for coming off. A split was repaired with one of my biggest patches, and at last we got him off after many expressions of thanks.

To the Tyrol and Back on Motor Cycles.—

The road now got frightfully dusty, and we were nearly choked by an overtaking car, which, however, we soon repassed in trouble as we rode into Innsbruck. We put up at the Arlbergerhof; this hotel was good, but the arrangements for meals most unsatisfactory, the system being that you had to have them in an adjoining restaurant and pay for them separately, provided the staff were not too busy to wait upon you.

Innsbruck and the Brenner Pass.

Innsbruck seemed very prettily situated, and was full of climbers, or, perhaps I had better say, those apparelled as such in wide knickers made of fancy leather or velvet, a fancy waistcoat over a white shirt, whilst the furry green hats with feathers, or what appeared like a gigantic shaving brush, stuck up saucily behind the crown, "capped the lot."

Our run to-day had been 106 miles, and the petrol bought had cost over 10s.

Next day, Sunday, the 23rd, we again set off on another glorious but hot day, and before we were out of Innsbruck I struck a villainous gutter. Hastily putting up my hand, I was too late to stop Grange, and he caught the long exhaust pipe of his Bradbury and broke it beyond repair, so he wrenched it off and threw it into a field.

The Brenner Pass starts straight away, and as one sweeps round bend after bend gives fine views of Innsbruck nestling on the plain below. We both lowered our gears, and tackled a steady climb of twenty-three miles over a road very loose in parts. After ten miles I pulled up with a puncture caused by a sharp flint, and then after another ten miles of steady pulling I saw a nice long steep bit to finish with. Opening the throttle to the full, I shot along, but the hard work was taking it out of my plucky bicycle, and on pulling the pump up I found I had no oil in my tank. First came back air, then a notch or two of ignition, and, although I pedalled for a few yards, I pegged out within a hundred yards of the top. Propping my bicycle up, I sat in the shade and waited for Grange. Shortly he came along, and I could hear his engine settle into a steady hum as he caught sight of the steep bit. Gradually it slowed down, until he stopped some two hundred yards below. He had practically no petrol left, but had noticed a sign in a village lower down, so, refusing some out of my tank, he free-wheeled down, whilst I completed the remaining small distance.

At the hotel at the top I had something cool in a glass, replenished the petrol tank, and filled up with oil for the very first time. This I consider very good, as I had been giving a pumpful every fifteen miles with clockwork regularity to Lausanne, and after that one every ten miles; this, I think, shows the advantage of the drip feed pump over the ordinary "full up one minute and starve the next" variety.

A Long and Refreshing Descent.

Continuing our way past the summit, which is denoted by the prettily-situated village of Brenner, we kept company with a river for a long distance, and now and again passed a monastery or castle perched high above our heads on a peak or rock, as well as a few monks in their brown cassocks and cowls, with a tasselled silken rope round their waists. We also noticed an open-air church or chapel by the roadside, only the pulpit and altar being under cover.

We never seemed as if we should finish the descent, and even yet I cannot say where it ceased. Swiftly we bowled along, crossing and re-crossing the river, and now and again passing through pretty villages, past the fortress of Franzensfeste, through Brixen, with its right, left, right turns, on to Klausen, with its awfully narrow street which makes you instinctively tuck your elbows in, into the open air again, and a view of a Benedictine nunnery perched high on a hill top.

We called a halt to enjoy a cool smoke, and I explained to the nervous "Billy" that a tremendous "boom" was not thunder, but only what I have referred to before as a "rain-gun."

Resuming, we entered a narrow gorge, with the river for company. But what is this coming? Surely it is not? But, yes—and we pass the first bicycle and sidecar, a twin N.S.U.; and also, to complete the wonder, what appears to be the exact counterpart of a "Davis Double." Then into Bozen, which Mr. C. L. Freeston so aptly describes as the oven of the Tyrol.

We found the Hotel de l'Europe excellent, and very welcome after a hot ride of eighty-two miles. The evening was spent in dining out of doors, and then drinking lemonades and ices for the rest of a very sultry evening, to the strains of an outside orchestra playing "Poppies" and "Yip-i-addy-i-ay."

Petrol we again found was very difficult to obtain, and very dear, and Grange said that when he returned to fill up on the Brenner he was asked 10s. for a tank full, and, in the end, he paid 6s.

Fitting a Spare Cam.

Next day, Monday, the 24th, as luck would have it, it rained nearly all day, so we set to and cleaned our pistons and cylinder heads and changed exhaust valves to save grinding in. I changed my tyres over, whilst Grange put his new Dunlop on his back wheel, as it was not being improved with rubbing against his pillion seat. He also brought out his spare cam, and decided to make a proper job of it; so off he set, and, coming to a chemist's shop, after much difficulty persuaded the chemist to let him have some prussiate of potash. I think the man behind the counter thought he was going to commit suicide. Then Grange found a nice little workshop, and put a blow lamp on to the cam, softened it, eased it a trifle, case-hardened it, and it then fitted perfectly and gave not the slightest trouble; not content with this, he also altered the timing of his valves for the next day's climb, whilst I had another look at my gudgeon pin, and found that the rapid wear was being arrested somewhat.

May I here give a word of thanks to Messrs. Price, who very kindly paid carriage and duty on three quarts of their "A" oil, which were waiting for us at the Post Office, and so enabled us to have our favourite brand at the ordinary retail price, as if we were in England, instead of Austria.

(To be continued.)

LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost and Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and, should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Waterproof Motor Cycle Clothing.

Sir,—For some time I have had a rubber-proof suit. It has been a great success; at no time has it become sodden or allowed any water to come through. I find it very much more comfortable and handy than oilskins and just as effective. Therefore I always intend to use the rubber-proof suits in future, as I think there is no doubt about their superiority. H. G. GALBRAITH.

Sir,—I again beg to claim a little space in your valued paper. It is ridiculous for the Express Rubber Co. to say that oilskins are "no use for motor cycling generally as they are most uncomfortable." Probably they have not yet tried wearing oilskins, or, if they have, it has been their own fault for not choosing comfortable fitting things. There has not yet been put on the market any cloth that will keep out rain for so long a time as an oilskin. Therefore, "B.W.B." is quite right when he says it is "the best wet weather clothing." I do not suppose anyone would mind the "sea-dog" appearance if he were "warm, dry, and comfortable."

Another point the Express Rubber Co. and the Dunlop Rubber Co. seem to forget is that motor cyclists want to ride in fine weather as well as wet, and I am sure most riders will agree with me when I say that I would not like to ride eighty or a hundred miles in a rubber-proofed suit on a boiling hot day.

Wishing *The Motor Cycle* the success it deserves, IT 49.

Silence and Silencers.

Sir,—I have keenly appreciated your recent remarks on the noise created by motor cycles. I watched a large number of the competitors passing through this city (Oxford) on the 30th ult., and the amount of noise caused by some of the machines by the perfect gun-like reports of the exhausts made me feel ashamed to own myself as a motor cyclist. At one time I noticed three machines within twenty yards, two at least with free engines, racing while crossing the very centre of the city. They made no attempt to close the cut-out, which, I suppose, all machines are now supplied with.

I hope you will continue to pass the strongest remarks on the subject until the manufacturers are compelled by public opinion to improve in this direction. The present silencer is exactly the same as it was in 1907, and even earlier. I suppose some of the manufacturers think that a free exhaust will disguise a multitude of sins and noises which should not exist in the timing gear, etc. A.H.P.

Do Records Appeal to Buyers?

Sir,—I, like "C.B.R.," find that records do not appeal to me in the least. One fancies that they are made on special machines tuned for the purpose. One wants a machine to carry one daily, bad weather and fine, over hill and dale, on highways and byways, one which can be brought out of its shed and a journey taken on it with the full conviction that it will run out and home without any tinkering on the road, or require overhauling before another journey has to be taken. Even the Six Days' Trials do not appeal to me on account of seeing so much written about men adjusting their machines for hills, etc., and doing repairs and making replacements on the q.t. The trials should be run without tools or replacements of any kind except what are required for punctures.

What appeal to me are the accounts of tours by owners of machines which you publish in your valuable paper. They give one a good idea how the machines behave under working conditions. YORKSHIRE.

Lubrication Systems.

Sir,—After the great interest shown in one side of the question of motor cycle engine lubrication, namely, the introduction of oil into the crank case, one naturally took it for granted that the other side of the problem, namely, the getting of the oil into the bearings, was a matter that was settled beyond question of discussion.

It was therefore a matter of considerable surprise to me to find that in the case of every connecting rod which I examined at the last motor cycle exhibition at Olympia the oil holes had been drilled in the top of the big end bearing. Some had had the mistake aggravated by the addition of a system of oil grooves, also on the upper side of the bearing. No wonder one hears of rapid wear in big end bearings!

That the top is the wrong place to introduce oil is obvious from a short consideration of the problem. Every millwright knows that to lubricate a bearing efficiently the oil must enter at the point of lowest pressure. In a shaft journal bearing there is generally one side where the pressure is zero. The oil must obviously be introduced at that side. In a big end bearing the pressure varies cyclically, but the top is where the pressure attains by far its greatest force, due to the explosion. During a part of the cycle the oil is forced out of the bearing by this pressure, and in this case the oil grooves help the oil to get out, while only the viscosity of the oil tends to keep it in the bearing. That the oil is actually forced out has been proved, as the force has in the past been made use of to send oil up to the gudgeon pin, and so lubricate it and the piston. This could easily be done in motor cycle engines, and would

F. B. Roper (5 h.p. single speed Indian sidecar) who gained second prize in the Sheffield and Hallamshire M.C.C. winter reliability run to Bridlington and back (170 miles). The roads were thick with mud, and Mr. Roper mentions in a letter to us that the chain drive was ideal under the circumstances.

A False Rumour.

Sir,—May we trespass on your space to contradict a rumour which we have heard persistently of late to the effect that we intend marketing a 6 or 7 h.p. twin motor bicycle. We cannot imagine what has given rise to this rumour, unless it is that our 500 c.c. single-cylinder engine has developed over 8 h.p. at 3,000 revolutions.

RUDGE-WHITWORTH, LTD.
JOHN V. PUGH.

The T.T. Race Fund.

Sir,—With reference to the offer made by Mr. Cuffe and referred to in your last issue on page 54, we think it should be pointed out that so far as the leading makes of motor cycles are concerned, the offer referred to is a form of price cutting to which the makers would take exception, and this also applies to speedometers and other proprietary articles, otherwise no doubt many other dealers would be glad to do business on the terms referred to.

THE SERVICE CO. (LONDON), LTD.

Hill-climbing.

Sir,—Being intimate with both sides of Honister Pass, Frank Smith, and the behaviour of a privately-owned two-speed Clyno in the Lake District, I have no hesitation in proposing that the four-speed Clyno and sidecar will climb the Buttermere side at the first attempt, provided the surface is no worse than it usually is from, say, March to November. The greatest difficulty on Honister is to keep straight and prevent the machine from diving into the ravine on one side or into the gutter on the other. I should think the extra wheel and weight of the sidecar will greatly help the rider in keeping a straight course. It will be interesting to see if this is so, despite one wheel having to plough through the loose stuff. In any attempts I have witnessed or made there has been plenty of reserve power if the single track machines could have been held up in the loose metal. When at Olympia in November, I arranged with Mr. Smith to come North and climb all our "pimples," including Tow Tup, which I consider steeper and longer than Honister, but the surface is much better, except at one corner. This hill was once suggested for the 1912 annual open climb of the Westmorland M.C.C., but was voted too difficult.

LEWIS PENNINGTON.

Sir,—In your issue of the 28th ult. I notice a letter from Mr. A. Newman, in which he mentions a certain route embodying such formidable hills as Honister Pass and Buttermere Hause, and expresses a desire to see me climb these hills.

In reply thereto, nothing would give me greater pleasure, as I am really anxious to find hills with sufficient gradient to prove the limit of the hill-climbing powers of the Clyno. I am always open for such suggestions as Mr. Newman makes, but in your issue of the 4th inst. I read a comment on Mr. Newman's proposition signed by "Fair Play in all Things," and, in passing, I must say that this gentleman seems to be a thorough sport, and, in his opinion, Mr. Newman has asked me to do something outside the bounds of possibility. However, as already stated, I intend tackling this ascent, and, provided I am given a surface to carry my wheels, I enter upon it with every confidence of success.

I would esteem it a favour if Mr. Newman, who is on the spot, would be kind enough to let me know how soon I can attempt these hills, bearing in mind the weather conditions, as I expect they are covered with snow at this time of the year.

FRANK SMITH.

Sir,—May I again enter the lists in defence of my statement with regard to Honister Pass. I said that in my opinion it was impossible. To those who have seen cars ascend or know of those which have ascended I offer apologies. Nevertheless, until I see it done I shall still maintain my opinion both from what I know of it and from what the proprietor of the Buttermere Hotel said to me after I told him of the 90 h.p. racer's attempt. Mr. Newman says that three riders at least have so far succeeded as to be only waiting another attempt. I can quite understand any good low-geared machine might climb most of it. It is the last fifty yards, just after a very nearly right-angled bend to the left, where the test really comes, and here I believe, but I am open to correction, the gradient is 1 in 3½ to the top, with a deep covering of loose slag over which the driving wheels cannot get a good grip. Mr. Newman also says that coaches and motors "descend" daily in the season; but how many "ascend," which is the point in question? I hope as usual to be staying at the Buttermere Hotel next Easter week, and I should then enjoy nothing more than to watch attempts, and also to try my luck on my Scott machine. Either Mr. Newman's remark in conclusion is very subtle or else I am very dense, because, although Mr. Smith's Clyno is a wonderful hill-climber, there are limits if not in gradients, at least, in road surfaces, and therefore why not "Fair Play" as a *nom de plume*? FAIR PLAY.

[Two readers have written offering to accompany Mr. Frank Smith in his sidecar when the attempt is made.—ED.]

Proposed Silencer Trial.

Sir,—The Auto Cycle Union, to our thinking, is to be warmly congratulated for considering the running of a silencer trial, and while we agree that such a trial would help to determine the respective efficiency of silencers, we would suggest that in addition to noise, other important points such as back pressure, facility of attachment, ease of cleaning, lightness with strength, capacity and low manufacturing cost, be taken into consideration.

Needless to say, if a silencer trial be organised along these lines, we shall be happy to enter our Sharpe universal model.

BARRIMAR, LTD., C. W. Brett.

The Abuse of Cut-outs.

Sir,—In view of the agitation that exists at the present moment against noisy motor cycles, and feeling that the abuse of the cut-out by a certain class of irresponsible motor cyclists is bound to increase this agitation, we have decided to supply our Indian motor cycles in future with the foot lever which operates the cut-out fitted to our silencer entirely removed.

We have found from experience that the opening of the cut-out does not materially increase the speed or help the running of our standard touring machines in any way whatever. In fact, we are quite convinced that the long, tapered exhaust pipe which we fit on to our silencer, and which extends well towards the rear of the machine, instead of retarding, tends to improve the running of the engine, inasmuch as it apparently creates a vacuum in the silencer.

We hope you will publish this letter in your columns, and trust that other manufacturers of motor cycles will adopt this policy in the near future.

THE HENDEE MANUFACTURING CO.

Mr. and Mrs. J. C. Piddock of Isleworth, and their 8 h.p. Chater Lea-Jap. Mr. Piddock is the proprietor of "Sketches," and uses the combination in his business. The machine has been driven about 4,000 miles in all weathers, and the owner is very pleased with its behaviour.

"Clean Counties" and Local Taxation Licences.

Sir,—In your issue of January 11th you mention several "Clean Counties" in which no police traps have been worked during 1911. I would point out to you that the county of Durham should be included in this list. Such a thing as a police trap is not known in this county, and I shall be pleased if you will mention this fact in your next issue.

W. T. WALTON, JUN.,
Hon. Sec. Hartlepools and District M.C.C.

Sir,—In response to my letter under this heading, which you were kind enough to publish, quite a number of licences have been sent to me to pay here. Will readers who send revenue forms in future give registration numbers? I have also had enquiries as to how this can do any good, as the whole of the money paid ultimately finds its way to the Government. Now I take it the facts are as follows, and if not, I shall be glad of your corrections. Previous to the 1910 Finance Act, the whole motor cycle licence, 15s., went to the county fund of the county in which the licence was paid, but at the present time the county still receives the 10s., and the extra 5s. put on in 1910 goes to the Road Board, which was created at that time. But, I hear someone say, it is impossible that Mr. Lloyd George would let the motorist take all the benefit of increased taxation—and quite right. The extra petrol tax introduced under the same Act would recoup the Government to the extent of £1 per annum in the case of a motor cyclist doing mileage of seven thousand miles or so, and this distance is, I should say, exceeded by most men using their machines regularly.

A. B. BENNETT, Hon. Sec., Derby and District M.C.C.

[An explanation of the method of dealing with the licence money was published last week. See page 49.—ED.]

This Year's Tourist Trophy Race.

Sir,—My attention has been called to a leader contained in your issue of the 11th inst., on the subject of this year's T.T. Race for motor cycles, in which you make certain statements which are hardly fair to the Manx authorities. For instance, you say: "Though several applications have been made to the Isle of Man authorities for permission to hold the race, no reply which will lead one to suppose that consent will be given by the Tynwald Court has been received up to the present."

This statement is not correct, and perhaps you will allow me to give you the actual facts.

In November last, the Secretary of the A.C.U. in a private letter to the Chairman of the Highway Board of the Isle of Man thanked the Manx people for the facilities given for the holding of the race, and in a casual way asked if they might hold the race here in 1912. From that date up to January 10th, 1912, no further letter has been received by the Isle of Man authorities on the subject of this race, and no intimation in any shape or form has been conveyed to the Isle of Man authorities which would lead them to believe that their decision on this matter was urgently required.

In former years the permission for the holding of the race has been granted about February, and there was nothing to lead the Manx authorities to believe that the decision for the 1912 race would be required any earlier.

It may interest your readers to know that this matter will be decided upon by the Tynwald Court on January 23rd.

I might say that, in my opinion, if permission for the race be refused, the fault will not lie with the Manx authorities or the Manx people, but with the A.C.U., who know full well the amount of misbehaviour of some of the competitors here in June last, and the way their conduct was annoying—and rightly so—to the people in the island, and neither the A.C.U. nor its Secretary took any steps whatever to stop such proceedings, and although they had before them the names of some of the competitors who were the cause of all this trouble, the A.C.U. did not either censure or disqualify them from any of the competitions.

If the races are to take place in the Isle of Man this year—and Manx people, after all, are sportsmen—it will only be on such conditions as will give the Manx authorities power to prevent such disgraceful proceedings taking place as took place here in June last.

As regards the other paragraphs in your article as to whether a course more suitable than the Isle of Man is to be found in the North of France, anybody who has been there knows that such a course does not exist.

Why is the British motor bicycle the best machine in the world? Because the T.T. Races and competitions have been held in the Isle of Man.

GEORGE J. A. BROWN.

The M.C.C. London-Exeter Run.

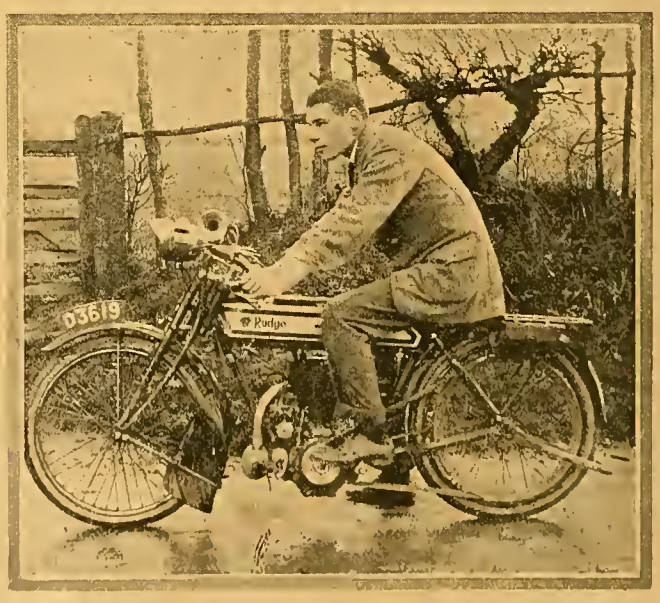
Sir,—Referring to the paragraph "A Reader's View of the Exeter Run," on page 40 of the last number of *The Motor Cycle*, I should be very glad to learn, and so, no doubt, would the committee of the M.C.C., how to give each of eighty members a gold medal costing over £1, and yet have a balance in hand out of 119 entry fees of 10s 6d. each. As a matter of fact the club will make a loss of something like £50 over the event, and if it were not that we are in a fairly strong financial position the club could not undertake these big competitions.

SOUTHCOMB MAY, Hon. Sec. M.C.C.

Sir,—A contributor's list of the 100% successes in the M.C.C. twenty-four hours' run to Exeter is published in "Current Chat" of your last issue. The writer has, however, omitted the two Service machines which were entered and successfully ridden by Mr. W. C. Hémy and myself, and which were the only two machines of that make in the trial.

He, furthermore, goes on to say that the entrance fees practically bought the medal for all but the very unfortunate. I am not aware as to whether your contributor was a competitor or not, but as his letter gives the inference that the run was a pantomime ride, I should say not, for I am sure that all the competitors will agree with me that any machine which was successful in that run reflects the highest credit upon its manufacturer, and that the element of luck was very minor indeed.

STANLEY B. WHITE.



Multi-pole Sparking Plugs.

Sir,—Noticing that Messrs. Lodge Bros. are soliciting correspondence *re* "Double-pole Plugs" in your columns, I thought my experience with them would prove interesting.

I have not found them to have the least effect on the magneto, but the one great fault they have is that they cause a machine (particularly a big twin) to be very hard starting, and for this reason I only use the double-pole plugs when I want to get the last ounce of power. I consider the plugs give about five per cent. more power and speed.

By the way, while speaking of magnetos, I should like to enquire if it is possible to time the new twin Bosch magneto with enclosed sides, except by the contact breaker. As far as I can see to get at the inside, the magneto sprocket would have to be taken off and the whole of one side of the magneto.

E. F. BAXTER.

W. Erlam Garden, mounted on his 1912 Rudge. At the Wanderers Motor Cycle Club's Hill-climb, on Cudham Church Hill he made fastest time in the class, and was first on formula.

Horse-power Rating.

Sir,—As your hospitable and widely read columns are always open to any remarks that may be of interest to motor cyclists, may I draw your readers attention to an article in one of your contemporaries? In *Engineering* of December 15th, there is an article which discusses a paper on "The Rating of Petrol Engines." This paper was read before the Institution of Automobile Engineers some time ago, and definitely shows that the R.A.C. and Treasury formulæ for horse power are not satisfactory from a racing man's point of view.

The writer of the article in the journal draws attention to the fact, as did the writer of the paper, that horse-power formulæ based on bore or stroke alone can be evaded, by producing engines in which unhandicapped dimensions are accentuated. They go on to show that a capacity of cylinder rating is the only method at present in practical use by which anything like fairness in handicapping can be approached. Furthermore, in order to prove it to their professional brethren they draw upon the motor cycle T.T. method as illustration. *Verb. sap.* T.M.L.

The Evolution of Transmission.

Sir,—In reply to "F.C.J." In his whole-hearted advocacy of shaft drive, your correspondent omits to mention two important matters. He does not say if his district is hilly or well supplied with good roads. I, too, am a country doctor, who, for six out of the past eight years, have done the work by motor cycle, entirely without assistance from horses. In fact, in that period of time I have not kept a horse. I tried shaft drive for six months, with poor results so far as I was concerned.

The horribly unsatisfactory results then to be obtained with direct belt drive had persuaded me to try gear transmission. I then lost heart altogether, and in despair took to a car. This I drove for two winters. I had the following objections to this mode of progress:

1. The expense was about five times as much.
2. The car could not go where many of my patients lived.
3. The work took longer.
4. The nuisance of water-cooling in the winter.
5. The danger of meeting fast cars and heavy traffic (on the wrong side of the road) in the narrow lanes.
6. The exertion of stopping and starting frequently.

I now ride a two-speed lightweight (which I have had three years), with chain to counter-shaft, 6in. pulley on this, and thence by belt to back wheel. I have no clutch (which is down in the dirt with a motor cycle), and can change up and down on any hill that the engine, so geared and at the same number of revolutions, will tackle. My belt never slips, and has not required shortening in the last 1,000 miles. I used two belts in the last twelve months (10,000 miles). For over 600 miles this belt dragged the machine (130 lbs.), myself (217 lbs.), (trailer (40 lbs.), and load (121 lbs.)—within 2 lbs. of 500 lbs.

Your contributor says that the great danger of shaft-drive is a seized engine. What about a big end of the connecting rod going? This happened to me on both a gear-driven motor cycle and on my car. On another occasion a stone got wedged between the back sprocket on the car and the chain, and I flew over the steering wheel and a hedge into a field. CHAS. S. PATTERSON, M.B., M.R.C.S.

The Swiss Rain Guns.

Sir,—Allow one of your regular readers to express his experience concerning a statement of your contributor Mr. Fawcett about what he cal's "rain guns" in Switzerland. Does Mr. Fawcett seriously believe that Swiss peasants are so uncivilised as to think they can frighten away a rain cloud with a pop-gun?

The guns he mentions are erected in great numbers and with great expense against the hailstorms, which are so terrific and so sudden in Switzerland. I was attending a picnic once, with Swiss friends, on the top of those mountains which Mr. Fawcett mentions as being covered with vines. It was in August, and the grapes were very abundant. The day had been hot and stormy, and by two o'clock a small black cloud was seen pointing out over Geneva.

Swiss people know what a cloud over Geneva means. In a wonderfully short time that cloud had spread over the lake and the colour being that of lead, it was evident a formidable hailstorm was approaching. In fact, from our high position we could distinctly see the surface of the lake hammered by hailstones just under the cloud, the edge of which was now reaching the lake banks. At that moment the air was shaken suddenly by formidable detonations, as frequent as one per second, and in looking down we could see hail guns in quantities, erected upwards, and firing their gaseous projectiles.

I had been wondering for some time as to the efficacy of these, and was awaiting anxiously the results. The storm was soon above our heads pouring in torrents. There was a tremendous roar of thunder and the lightnings were tearing the darkness, but no hail could be seen. P. MINAULT.

THE MOTOR CYCLING CLUB ANNUAL GENERAL MEETING.

The annual general meeting of the Motor Cycling Club was held at the Inns of Court Hotel on the 10th inst., at 6.30 p.m. Mr. Charles Jarrott, the president of the club, was in the chair, and we regret to say he was in a very poor state of health. Only his devotion to the club brought him to the meeting. After the very satisfactory annual report and statement of accounts had been passed, the officers of the club were elected, and next followed the election of the executive. The 1912 committee stands as follows: Messrs. H. G. Bell, A. Candler, E. B. Dickson, S. H. Fry, C. Gibbons, E. Gwynne, R. H. Head, J. van Hooydonk, F. J. Jenkins, C. J. Seed, W. H. Wells, and A. J. Moorhouse. Mr. B. Marians was elected captain of the club. Mr. Arthur Candler, the popular ex-hon. sec., was elected a life member.

A capital smoking concert followed the meeting, at which a number of well-known artistes displayed their talent. Among the professionals, Mr. Ernest Cherry, a M.C.C. member, gave some selections from his clever impersonations; while among the amateurs Mr. F. Gillett, accompanied by Mr. Hal. Hill, sang some humorous topical songs of his own composition. A refrain, "We don't want more letters from Archibald," and "We've a very good sec. in Southcomb May," went down very well.

THE MOTOR CYCLE IN WARFARE AND ON MANOEUVRES.

UNDER the auspices of the Streatham and District M.C.C., an instructive lecture was given at the Royal Automobile Club, on Friday last, by Major Phillips, R.E., on the above subject.

The lecturer explained what constitutes a division on the march, and showed how in marching the force might tail out to twenty-five miles in length. Men and horses are supposed to keep to the left hand side of the road, but the space on the right is generally too narrow for a motor car, and it is in the transmission of instructions from one end to the other of the division that the motor cyclist might be most effective.

Major Phillips, in referring to the pedal-propelled cycle, pointed out that, while this means of locomotion offered advantages over rough ground, the motor cycle had immensely the advantage over long distances. In comparison with the horse, too, the motor cycle offered enormous advantages.

To work along a line of march satisfactorily, a motor cycle must, however, fulfil certain requirements. It must be quiet, and it is most important to keep down the dust or mud as much as possible. In suitable countries and in a modified way, it might be employed for scouting purposes, for medical work in bringing up light stores and instruments, for keeping two divisions in touch, and the rapid transit of troops from one point to another.

To meet the requirements of such work, a motor cycle with interchangeable parts would have to be used, and one that could use paraffin as fuel would be at an enormous advantage.

In concluding, Major Phillips mentioned that, while it was desirable for the soldier to have a thorough knowledge of his motor cycle, it was also most important that he should have a sound knowledge of military work. If they could not join the Territorials as motor cyclists, let them prepare themselves for that rôle by acquiring a groundwork of military knowledge in other branches of the force.

Derby and District M.C.C.

A winter run will take place on the 20th inst. The annual general meeting will be held at headquarters on the 24th inst.

Ipswich and District M.C.C.

A lecture on "Carburation" is to be given to the members of the above club by Mr. W. Low on Saturday, the 20th inst., at 7.30 p.m.

West Essex A.C.

The annual dinner will be held at the Great Eastern Hotel, Liverpool Street, on Saturday, the 27th inst., when the prizes in connection with last season's competitions will be distributed.

Yeovil and District M.C.C.

The first annual dinner will be held at the Half Moon Hotel, Yeovil, on Thursday, the 25th inst. After the dinner the prizes won in the past season will be presented, and a musical programme will follow.

Sheffield and Hallamshire M.C.C.

A meeting of the club will be held on Thursday, January 18th (to-day), at 8 p.m., at headquarters, King's Arms Hotel. Everybody present will be invited to address the meeting on "Strange Faults and how I remedied them." All motorists, whether members of the club or not, are cordially invited to be present.

Western District M.C. (London).

The annual meeting of the above club will take place on Monday, the 22nd inst., at headquarters at 8 p.m. A winter reliability trial will be held to Stokenchurch on the 21st—starting at 10.30 a.m. from the horse trough on Ealing Common, the route will be *viâ* Uxbridge and High Wycombe. Two hours' stop will be allowed at Stokenchurch.

South Birmingham M.C.C.

The first annual general meeting was held at headquarters, the Mermaid Hotel, Sparkhill, on the 11th inst. There are now about seventy-five members. A vote of thanks was passed to the following donors of prizes: Messrs. W. Allday, E. J. Spark, P. J. Evans, E. R. Lycett, J. J. Woodgate, F. W. Merrick, H. Shaw, H. Joyce, and the Singer Co., Ltd. The committee will meet on the last Thursday in every month.

Winchester and District M.C.C.

The annual meeting of the club was held at headquarters, the Royal Hotel, on Tuesday, January 9th, the president, Major the Hon. G. V. Baring, M.P., taking the chair. It was agreed to arrange competitive events to supplement those arranged by the Hants Motor Cycle Union, of which this club is a section. Major Baring kindly offered to arrange for the club to have the use of an excellent private road in the county for one of its competitive events, and the venue and particulars relating to this will be published in due course. Mr. G. S. Tungate, of 49, Parchment Street, Winchester, was elected hon. secretary.

Ilkley and District M.C.C.

The annual general meeting of the above club was held at the Crescent Hotel, Ilkley, on Wednesday, January 10th. The president, Mr. T. A. Pearce, was in the chair. The officers for 1912 were elected as follows: President, Mr. T. Archer Pearce; hon. treasurer, Mr. W. A. Robinson; hon. secretary, Mr. J. Norman Longfield, Laurel Bank, Ilkley.

The following events were arranged for 1912: January 30th, breakdown competition; February 6th, paper on reliability trials by the Hon. Secretary.

In future the club will have a private room at the Crescent Hotel, Ilkley, for the use of all members, from 7.30 to 11 p.m.

Nelson and District.

It is proposed to form a club in this part of Lancashire. All motor cyclists interested are requested to meet at the Bull Hotel at 7.30 p.m. on the 23rd inst.

Newcastle and District M.C.

There was a supper and smoking concert at the club house on the 11th inst. During the evening the prizes won during the season were presented.

Middlesbrough and District M.C.C.

At the annual general meeting, held recently, the following officers were elected: President, Mr. L. F. Gjers; captain, Mr. J. Gilchrist; hon. secretary, Mr. G. Goult. On the 12th inst. Mr. J. R. Sorrell lectured on "Dos and Dont's for Motor Cyclists."

Bristol B. and M.C.

An inter-team competition will take place on February 17th with Westbury as a centre. The first big event will be the open hill-climb on April 27th.

Finsbury Park C.C.

At the annual general meeting, held at headquarters on the 10th inst., Mr. G. R. Barrett was elected captain of the motor cycling section, and Mr. C. W. Cooke, 47, Mount View Road, Crouch Hill, general hon. secretary.

Coventry and Warwickshire M.C.

Members and their friends who propose to attend the eighth annual dinner and prize distribution, on Friday, February 2nd, at the Masonic Hall, should notify the hon. secretary without delay. Tickets are 5s. each.

Streatham and District M.C.C.

The winter programme is as follows:

Jan. 24th, Feb. 9th, Feb. 16th, and March 1st.—Lectures at headquarters.

Feb. 8th.—Bohemian concert at Hamilton Hall, Balham.

,, 23rd.—Annual general meeting at headquarters.

Cardiff M.C.

The annual dinner took place at the Park Hotel, Cardiff, on Wednesday last. Mr. A. Williams presided, and was supported by a goodly number of the members and officers of the club. During the evening the prizes and medals won in competition during 1911 were distributed by the chairman.

The annual general meeting will be held at the Park Hotel, Cardiff, on Tuesday, January 30th, when the programme for 1912 will be considered. There is promise of considerable discussion, and an interesting evening is anticipated. All motorists are cordially invited to attend and take part in the discussion. Application for membership should be addressed to the hon. sec., Mr. H. B. Jotham, 12, Duke Street, Cardiff.

North-west London M.C.C.

The annual general meeting of this club was held at headquarters on the 10th inst. Mr. Rowden (captain) and Mr. Stern (secretary) having resigned from those offices, the following officers were elected for the present season: Captain, Mr. H. J. Pooley; vice-captain, Mr. Frank Thomas; hon. treasurer, Mr. G. H. Hollis; hon. secretary, Mr. O. P. Hill.

After a long discussion, it was resolved that the rules be altered to make the entrance fee henceforth 7s. 6d. and the annual subscription 12s. 6d.

A very full programme has been provisionally arranged, and details will appear in due course.

A rather small attendance greatly enjoyed a most excellent programme at the annual smoking concert last Friday. There was not a weak item during the evening, but the following deserve special mention: The St. James' Glee Singers, Messrs. Arthur Melrose, Fred Rome, Stuart-Debnam, and Gregory Jones

Club News.—

Wimbledon M.C.C.

The first run of this newly formed club will be to Guildford on the 21st inst., starting from Wimbledon Town Hall at 10 a.m.

Newcastle M.C.

The annual general meeting was held at the Central Exchange Hotel. Mr. W. Dunn (hon. sec.) presented the annual report of a very successful season. The following officers were elected: President, Mr. J. R. Scott; hon. treasurer, Mr. T. G. Atkinson; hon. sec., Mr. W. Dunn.

Mersey M.C.

The first annual general meeting was held on Thursday, January 11th, at headquarters, St. George's Restaurant. The following officers were elected for 1912: President, Mr. P. J. Robinson; captain, Mr. G. H. Lake; hon. treasurer, Mr. G. Morley; hon. secretary, Mr. S. W. Carty, 'Bankfield Road, West Derby, Liverpool. A highly interesting and instructive discussion took place regarding the programme for 1912, and many novel and valuable suggestions were made for the benefit of the club and to the advantage of its members. A vote of thanks to the president terminated the proceedings.

THE TOURING TRUMP.

We are officially informed that Mr. F. A. McNab has disposed of his interest in Trump Motors, Ltd., and has resigned his position as director and sales manager. The registered trade mark for motor cycles, the "Trump," was purchased by the above company, and the business will be continued by that concern. We are asked to allay the impression that the Trump motor cycles are made only as racing machines.

ANOTHER NEW MACHINE.

Mr. Harold Williamson, formerly with the Rex and Singer Companies, is starting a company to manufacture a motor cycle to be known as the "H.W.S." This machine will be made in two sizes—2¾ h.p. and 3¾ h.p.—both single-cylinders; the former will have an engine of 76 × 65 mm., and the latter 86½ × 85 mm. Both will have overhead valves and half compression starting devices. These two sizes will be again subdivided into T.T. and clutch models, the latter will have a Doherty clutch, consisting of a large band-expanding into a drum formed on the rear hub. The address of the new concern is the Harold Williamson Motor Supply Co., 26, Sherlock Street, Birmingham.

HERTS. COUNTY A.C. (MOTOR CYCLE SECTION) ANNUAL DINNER.

THE annual dinner of the above mentioned prosperous club was held at the Holborn Restaurant on Friday evening last. Mr. Otto Thomas (*The Motor Cycle*) occupied the position of chairman. At the conclusion of the dinner a very large number of prizes were presented by Mrs. C. C. Cooke, the wife and energetic helper of the honorary secretary.

In proposing the toast of "The Club," the Chairman said he was pleased to see how the club had prospered. Two years ago it had but twenty members; now its membership exceeded 200, and it held the proud position of being the largest club affiliated to the A.C.U. As a Hertfordshire resident, he hoped it would long continue to prosper. The club consisted of true sportsmen. The movement should endeavour to gain a reputation for everything that is good and nothing that is bad, and the club should strike a high note in all its undertakings. It should exist not only for the sport and pastime, but for good fellowship and co-operation. Such a club spurred on the manufacturers to the attainment of a high standard of efficiency, and at the same time gave the manufacturer his reward by attracting more people to the movement. He was glad to see that the club encouraged ladies to participate in the pastime, and, in this connection, he had pleasure in announcing that *The Motor Cycle* would present another cup for a ladies' competition to replace the one won outright by Mrs. C. C. Cooke last year.

Mr. C. C. Cooke, the energetic hon. secretary, in reply, said that the Chairman had shown himself to be a good member of the Herts club. He was glad to announce that the first competition of the year, an open reliability trial, to be held next Saturday, had received between sixty and seventy entries. A handsome silver cup rested on the table, which was one of two which would be presented for the best performances in the four open reliability trials held by the club.

Mr. F. A. Hardy then proposed "The Visitors," which was responded to by Mr. F. Gillett in an amusing speech.

Mr. Pratt, in a speech in which he had to contend against continual, though friendly, interruptions, proposed the toast of "The Ladies," and announced that he would give a prize for a lady's competition. Mr. Hal Hall then replied on behalf of the fair members present.

Mr. R. Rice Pyle proposed the toast of "The Press," which was responded to by Mr. E. M. P. Boileau *(The Motor Cycle)*.

Mr. C. C. Cooke proposed a hearty vote of thanks to the Chairman.

The speeches were interspersed with an excellent musical programme, one of the most appreciated features of which was a series of topical songs by Messrs. Hill and Gillett.

THE STREATHAM AND DISTRICT M.C.C. ANNUAL DINNER.

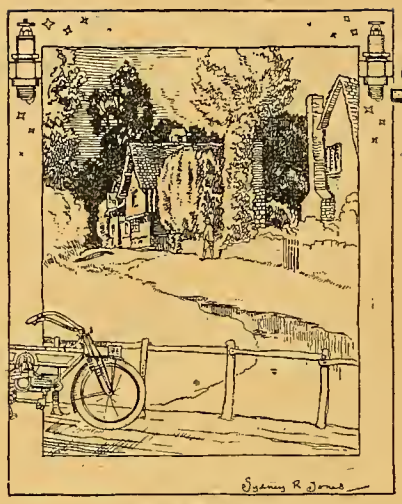
THE annual dinner of the Streatham and District M.C.C. took place at the Holborn Restaurant on Saturday last. The attendance was good, and indicated that, though the club was young in years, it was an energetic and really live institution. Mr. J. W. Orde, secretary of the R.A.C. and president of the Streatham Club, was in the chair.

In proposing "The Club," the Chairman said he must congratulate them on their work during the past year. Touching on the benefits of affiliation, he said that very few members of the Streatham and District M.C.C. had applied for legal assistance. Did that mean that very little riding was done by Streatham motor cyclists? (Laughter.) Anyhow, those who had applied had got off. The motoring movement had developed a new race of people. Previous to its inception there were comparatively few mechanical engineers in this country; now everybody said they knew all about everything connected with internal combustion engines, and what they did not know about them they did not say. (Laughter.) This new race was courageous, *vide* the splendid courage shown in competition held on both track and road, and courteous in that due consideration was extended to other users of the highway. In conclusion, he must congratulate the club on its officers, Mr. H. P. E. Harding the chairman, Mr. Ayres the treasurer, and Mr. J. H. Jeffery the hon. secretary.

Mr. J. H. Jeffery (hon. secretary), who was greeted with deafening applause, spoke of the club's successful season, mentioning the chief events of the past year, and thanking the donors for the prizes they had presented. The club's success, both on the social and competition sides, he said in conclusion, had been due to the excellent work of the committee.

At this stage the Chairman presented the prizes, of which Mr. F. W. Barnes received so many that he employed an assistant with a basket to carry them away.

Mr. V. Hart proposed "The A.C.U." He remarked that its membership was close on 5,000, and that number did not nearly approach the possibilities in this direction to which the Union might attain. Touching on the A.C.U. competitions, he mentioned the possibility of holding the T.T. race in France, a remark received with loud applause.



Mr. F. Straight (sec. A.C.U.) in reply spoke of the work of the A.C.U., how that body, appreciating the growth and strength of the affiliated clubs, was this year leaving the majority of competitions to them. Other subjects touched on were the military motor cyclists' scheme, the evils of central tramway standards, the use of reflex lights, etc.

Mr. H. Hunter then proposed the toast of "The Visitors" which was responded to by an amusing speech from Mr. B. H. Grey. The toast of the press was given by Mr. W. Pratt and responded to by Mr. E. M. P. Boileau *(The Motor Cycle)*, Mr. W. G. McMinnies and Mr. V. P. Winkoskie. The toast of "The Chairman" was proposed by Mr. H. P. E. Harding. Mr. Orde in the course of his reply expressed his best wishes for the club in 1912, and said he would present another prize this year to be won outright. (Applause.) The programme was interspersed with music

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Daventry to Southwold.

(1.) I should be much obliged if you would tell me the best and quickest way from Daventry (in Northamptonshire) to Southwold (in Suffolk), with distance. (2.) How long would it take me on my T.T. 1912 Rudge?—A.J.M.

(1.) Your best route would be as follows: Daventry, Weedon, Northampton, Wellingborough, Higham Ferrers, St. Neots, Cambridge, Newmarket, Bury St. Edmunds, Haughley, Stowmarket, Framlingham, Saxmundham, Blyburgh, to Southwold. The distance would be approximately 155¾ miles. (2.) It would take you a day to cover, and you would have to travel fairly fast to do it at this time of the year.

Too Much Petrol.

My engine is always overheating even on level roads, and will take full air always, slow or fast. Would the fact of the weights (balance on needle valve) being worn where they come in contact with float be the cause, and do you think that if I lowered the petrol level in carburetter it would make things better?—E.I.

Yes, the trouble is due either to too much petrol through too high a level, or through too large a jet. Why not check the level as mentioned in the hints on carburetter adjustment in "Motor Cycles and How to Manage Them"? Try lowering the level first of all, and if this does not bring about the desired result try a smaller jet.

An Adjustable Tappet.

I see, according to some of your correspondents, that there appears to be some trouble to get a satisfactory adjustable tappet rod. I have thought of an idea so that I could make an adjustable tappet that could be adjusted in a second without spanners or tools of any kind, and could never shift, as it would be self-locking in any position, or could be made adjustable from the tank. Do you think this idea would be worth patenting or not? The cost would only be a few shillings. Should I make one and put it on my own motor first, before troubling any further about it?—S.G.B.

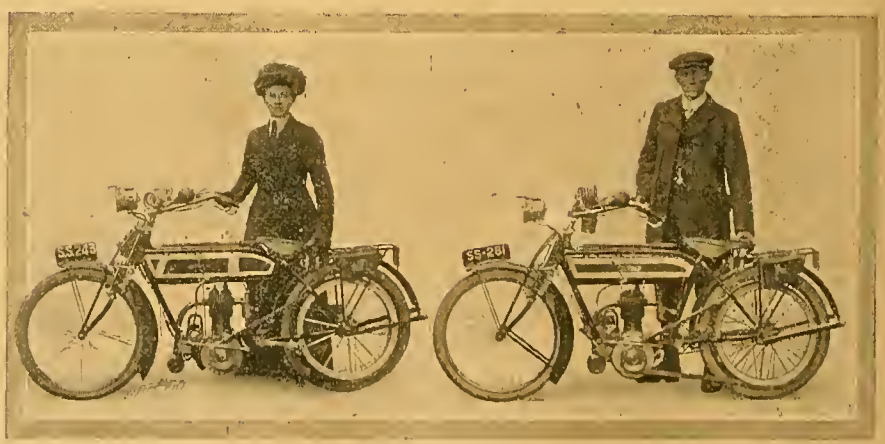
If you can make the device adaptable for any make of machine, and sell it so that amateurs can fit it themselves, it would probably be worth patenting. We should certainly advise you to make one and put it on your own machine first of all, and then, if it is successful, send details to us and take out a provisional patent.

Two-cycle Engines.

When examining a 1911 Scott machine (second-hand)—(1) Where should I specially look for signs of wear? (2.) What special risk is incurred from much worn parts on this machine as distinct from a four-stroke machine? (3.) How long will the chains run without replacing? (4.) Does this machine become less reliable and more difficult to start after considerable wear? (5.) Is the back wheel easy to remove? (6.) How far will a Scott take a sidecar and light passenger (9 stones) on ordinary roads per gallon of petrol?—L.B.C.

(1.) Examine the roller bearings and look for vertical play in the connecting rod, gudgeon pin, and mainshaft bearings, as in the case of a four-cycle engine. Also examine the transfer gauzes to see if these are in good order, the chain sprockets and tyres; also look for leaks in the circulation system. (2.) We do not know of any more risk being incurred than in a four-cycle machine. (3.) The chains should run about 5,000 miles without replacing. (4.) We do not think so. (5.) The back wheel is fairly easy to remove. (6.) About fifty m.p.g.

Leicester to Hereford.



Please give me the best route from Leicester to Hereford, also total mileage. I have done this journey once *viâ* Coventry, Birmingham, and Worcester, but wish to know if there is not a better route. My machine is a 3½ h.p. two-speed and sidecar, therefore I want to avoid very bad hills. I am at present using a No. 32 jet in carburetter—would it increase power to fit one larger?—H.S.

Your best route would be as follows: Leicester, Wolvey, Coventry, Kenilworth, Warwick, Stratford-on-Avon, Alcester, Evesham, Tewkesbury, Ledbury, to Hereford. There are no hills on this route which should worry you. The distance is approximately 107 miles. You might try a slightly larger jet.

Double-spark Plugs.

Will you kindly advise me on the following points: (1.) Would it be advantageous as regards ease of starting from cold, general running, etc., to use any of the double spark plugs advertised in your journal on my 1911 Douglas? Would there be any disadvantages? (2.) What alarm or warning fitment is there on the market suitable for the above machine to be worked by the right foot?—T.W.

(1.) Undoubtedly a little improvement would be obtained by using a two-spark plug. (2.) Possibly an alarm bell or an exhaust whistle to be operated by the foot might suit your purpose.

MARRIED COUPLES WHO MOTOR CYCLE.

Mr. and Mrs. O'Donovan, of Bedford, riders of free engine Singers. Mrs. O'Donovan has had a Kerry, a Rex, and a Singer Moto-Velo. Her husband was the first to successfully complete a long-distance trial with engine valve caps and other parts sealed.

A Spring Frame Machine.

I am considering buying a P.V. motor cycle, and I should be very much obliged if you will answer me the following questions: (1.) Do you consider it a thoroughly reliable machine? (2.) Is the spring frame comfortable and efficient? (3.) Is the N.S.U. two-speed gear easy to manipulate and foolproof? (4.) Do you advise me to get a 3½ h.p. single-cylinder or a 5½ h.p. twin-cylinder for solo work? (5.) Would the 5 h.p. take a sidecar? According to your Buyers' Guide of 1912 models issued on November 16th, the weight of these machines is very low. (6.) Is the frame a good strong one?—E.H.

(1.) We consider the machine in question to be quite reliable. (2.) The spring frame is comfortable and efficient. (3.) The two-speed gear referred to is easy to control and satisfactory. (4.) Whichever you prefer. If capacity were identical we should choose the twin. (5.) The 5 h.p. would take a sidecar. (6.) The frame is strong enough, but we are not sure of its suitability for attaching a sidecar owing to the springing.

Sidecar Machine for North Wales.

I contemplate purchasing a motor cycle this year, which I require for sidecar work as well as solo, and I shall be much obliged for the following information: -(1.) Do you consider 3½ h.p. Bradbury with two-speed gear chain drive a safe machine for sidecar, weight of self and passenger 22 stones? I live in North Wales, and, no doubt, you are aware of the hilly nature of the district. I was at the recent Show, and I was rather impressed with the above machine. (2.) If you do not consider 3½ h.p. strong enough in frame construction and power for sidecar work is the 5 to 6 h.p. F.N. a reliable machine, and what will be the extra cost of the up-keep of the four-cylinder against the 3½ h.p. or against the 5 to 6 h.p. twin? (3.) I have been offered a 4½ h.p. Quadrant for a reasonable price—is this machine reliable, and likely to give satisfaction for sidecar work? This machine is also fitted with a change-speed gear. (4.) With a chain or gear drive will the wear and tear of tyres be any heavier than with belt transmission? I expect chain or gear will last as long as half-a-dozen belts.—O.W.

(1-2.) We think the machine about which you specially enquire would be quite suitable for the purpose for which you require it. Unfortunately, however, there is not very much reserve of power when you have to use a sidecar in a hilly district. It is quite strong enough as regards frame construction. On the other hand, the four-cylinder would not be any more suitable, as the engine is of smaller capacity by 60 c.c. than the first machine. To enable you to get up all hills with single figure gradients in Wales you would require a change-speed 7-8 h.p. twin. (3.) The machine mentioned here is reliable and likely to give satisfaction. It is not so suitable for sidecar work as the first named, as it is not chain driven. (4.) The tyres will wear a little more perhaps with chain drive, but then this is practically essential if you are going to carry two people. On the other hand, the chains or gears will outlast belts.

A Novice's Queries.

(1.) Are Premier motor cycles reliable and good? (2.) Can a 3½ h.p. single-cylinder free engine with two-speed gear pull a sidecar (as shown by Griffin and Co., Birmingham, with screen and hood and reasonable amount of luggage) up any hill, without the passenger having to get out? (3.) Is there much vibration and strain in riding a motor cycle?—P.H.

(1.) The machines in question are certainly good and reliable. (2.) 3½ h.p. is not enough. You would want about 7-8 h.p. if you wish to carry so much with you. (3.) No, there is practically no vibration from modern motor cycles.

Sidecar Machine for Derbyshire.

Will you kindly advise on the following? I am about to buy motor cycle and sidecar. (1.) Is 3½ h.p. powerful enough? (2.) Is Triumph, New Hudson, or Bradbury the best, or do you recommend another make? (3.) Is chain or belt drive the best? It will be used exclusively for sidecar work. (4.) What sidecar do you suggest? I do not care for the basket car, and want one reasonably weather-proof for passenger. (5.) What clothing do you suggest for wet weather use only? In conclusion, I want a cycle more for reliability and economy than speed.—J.D.

(1.) 3½ h.p. is enough if you do not intend to tour in exceedingly hilly country where there are many single figure gradients. (2 and 3.) It is against our rules to differentiate between the makes mentioned. All are good, but we may tell you that for your district (Derbyshire) a variable speed gear is essential, and preferably chain drive. (4.) Any well-known make of sidecar would do. One has a fairly good choice of bodies nowadays. (5.) Either oilskins or a good waterproof suit would be the most suitable clothing to wear.

Horse-power Rating.

Could you tell me (1) how much difference in power as regards hill-climbing lies between two engines A and B of similar construction? A cubic capacity 499 c.c., bore and stroke 85 × 88 mm. B cubic capacity 997 c.c., bore and stroke 86 × 96 mm. I assume that each machine is fitted with a reliable three-speed gear, and is to be used for sidecar work? (2.) Does the expression "mm." which I have once or twice found written "m/m." refer to millimetres? (3.) How is the cubic capacity of the engine obtained from the dimensions of the bore and stroke?—HARICOT.

(1.) B should have an advantage of about ½ h.p. A well-known formula gives the horse-powers—A 4.67, B 5.16. It is possible that, by careful tuning, special timing and design of valves, etc., the smaller engine might be made to give more power than the larger. (2.) Yes, mm. means millimetres. (3.) To get the cylinder capacity, square the bore, multiply by .7854, multiply by the stroke, and divide by 1,000.

EXPERIENCES WANTED.

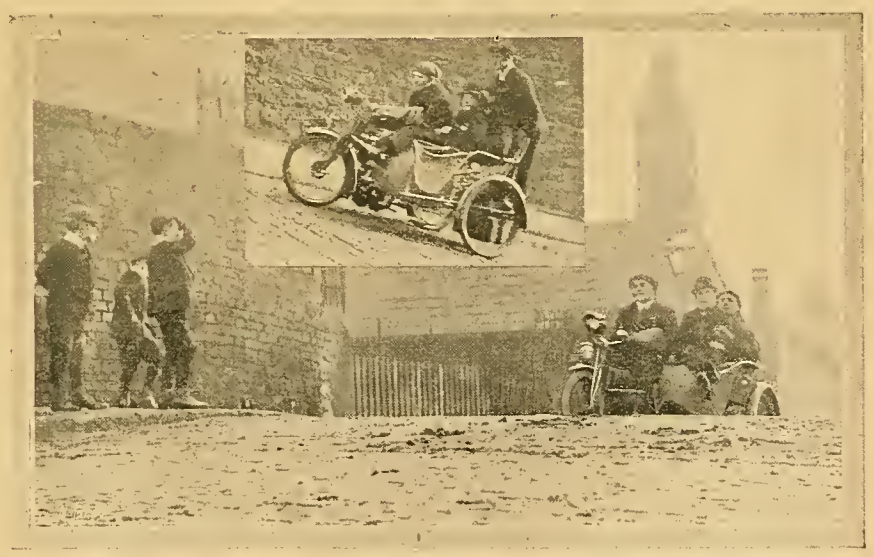
"T.R.T." (Cardiff). (1.) 3½ h.p. Lincoln-Elk. (2.) Any 2¾ h.p. lightweight, both with sidecar.

"D.H.W." (Bath). A modern reliable 3 h.p. engine suitable for fitting to a 1906 Triumph frame.

"G.J.B." (Middlewich). 3¼ h.p. 1912 Rudge with and without sidecar.

"A.L.C." (Lee). L.M.C. Auto-varia gear with free engine on 3½ h.p. machine and sidecar.

"G.O.F." (Epsom). 4 h.p. Indian, control, reliability, consumption, wearing qualities.



"F.C.C.K." (Devonport). Two-lever carburetter fitted to 7 h.p. Indian.

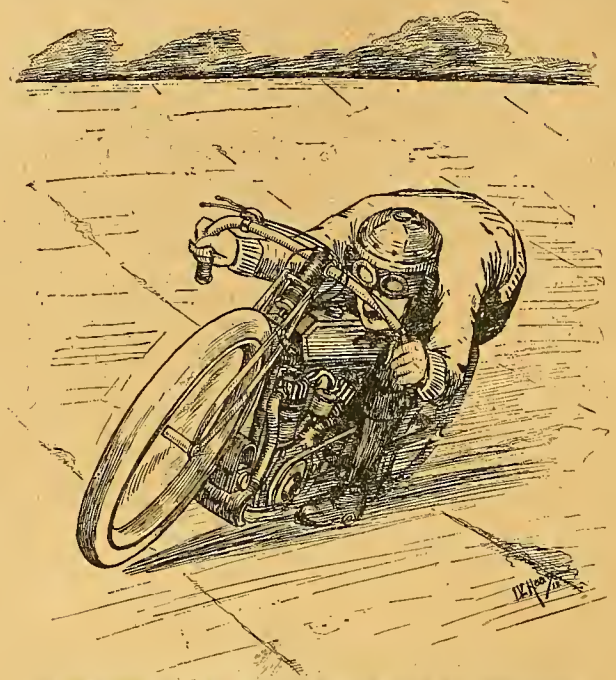
"C.H.P." (Sparkbrook). 2¾ h.p. (two-speed) Enfield.

C.P. (Tooting).—6 h.p. Matchless twin, belt drive, reliability and control.

"C.L." (Chelsea). Two-speed Douglas.

MANCHESTER'S WORST HILL.

Stoney Brow was recently climbed by Harry Reed, mounted on an 8 h.p. Dot-Jap, from a standing start with three extra passengers. The gradient is 1 in 7 and the surface shocking, as the name implies. The larger photograph was taken at the hill summit, the inset about half way up.



A Chat with Mr. H. Collier, Sen.

WE found Mr. Collier at the new premises, 44, Plumstead Road, Greenwich, two minutes' walk from Woolwich Arsenal gates. It is not generally known that Mr. Collier served his country years ago by working at the big lathes in the naval gun factory at the Arsenal. His experience with "explosion engines" therefore dates from early days.

The new Matchless works should greatly facilitate the turning out of the 1912 models. It is a compact little factory, well equipped, well lighted, run on up-to-date lines, and capable of extension—a real credit to the hard work of Mr. Collier and his sons, who might well share the motto of another famous business man, "Great oaks from little acorns grow."

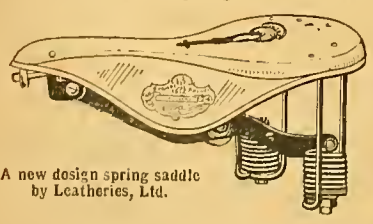
Unlike many other manufacturers, Mr. Collier is a hearty supporter of races of all kinds. In 1902-3, Charlie and Harry were making rings round their rivals, at Canning Town, using a 2¾ h.p. De Dion engine slung in an inclined position on the frame—an engine which was tuned out of all recognition. The two keen brothers learned their trade in the excellent school kept by Dame Experience, and now what they do not know about engine tuning, and making for that matter, is not worth talking of.

1912 Matchless machines are now being fitted with Matchless engines, made by Messrs. J. A. Prestwich and Co. We mention this fact, because it shows how much the Matchless firm has benefited by racing experience. Mr. Collier therefore seems to be thoroughly justified in what he says about the value of racing.

An impression of C. R. Collier at speed on his 8 h.p. Matchless-Jap. It is interesting to note that this Englishman's speed of 91.37 m.p.h. remains the fastest ride ever accomplished on a motor cycle.

"Where are France, Austria and Germany," said Mr. Collier, "who gave up racing five or six years ago, and at the time they gave it up could beat us? We have never given up motor cycle racing, nor have the Americans, and American or English machines can safely take on any Continental make."

Asked about Charlie's proposed visit to the States, Mr. Collier said he was quite willing for him to go, only he wisely insisted that the money guaranteed should be deposited, preferably with the Auto Cycle Union or some independent party, before he would allow his son to leave the country. Whether or not he could go would also depend on the date of the Tourist Trophy Race, and the number and date of competitions on the Continent this year.



In conclusion, Mr. Collier told us he felt the motor cycle boom was only just beginning, and that in the near future the use of the motor cycle would be vastly extended.

The College Patent Leather Mudshield.

Beard, Brown, and Co., College Street, Wolverhampton, the makers of the College mudshield, send free to all enquirers a full size model of the shield with samples of the leather of which it is constructed, and of the apron material. The model can be fitted up immediately by the rider, and by its means he is able to see at a glance how it adapts itself to his machine.

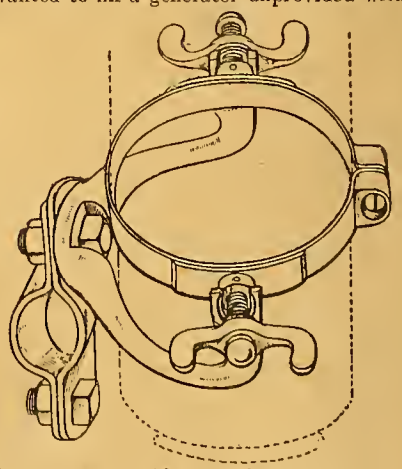
A New Saddle.

The Leatheries, Ltd., Sampson Road North, Birmingham, has recently introduced a new motor cycle saddle which is called the "Empire de Luxe." It is designed to allow the requisite clearance to enable the saddle springs to fit over the carrier and mudguard. The measurement between the spring hangers is 7in., which gives an extremely low position. F. A. McNab used one of these saddles in the Birmingham M.C.C. winter trial to York and back on the 27th ult., when he gained a gold medal, and was placed first with a total error of 1m. 45s. McNab weighs over 15 stones, so that the saddle was put to a severe practical test.

A new design spring saddle by Leatheries, Ltd.

SPARKLETS

Automatic Carburetters.

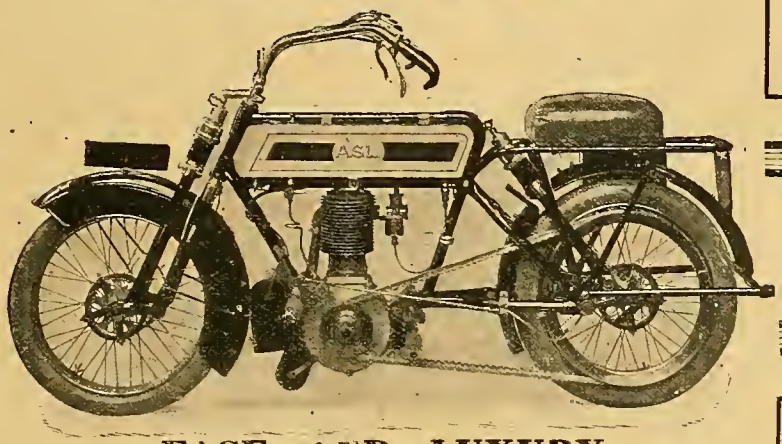


Mr. T. W. Tattersall drove a five years old mount in the M.C.C. Exeter run, fitted with a Stewart-Precision carburetter. Describing his experiences, he says that the exhilaration of driving with the throttle control only is superb, and variations of road, sudden or gradual, have no effect on the mixture, and the effortless feel of the engine is most satisfying. Petrol consumption averaged between seventy and eighty miles per gallon over wet and heavy roads with a twin-cylinder engine (75 × 75 mm.) sidecar and passenger.

Garage Accommodation in the City.

There have often been complaints about finding accommodation for motor cycles and obtaining petrol in the City of London, and it is interesting to note that the New Hudson Cycle Co., Ltd., have moved to new and larger premises for their London depot at 43, Gray's Inn Road, W.C. (just by Holborn Town Hall). The latest New Hudson models are in stock, also spare parts and sundries. A large garage at the back will be exclusively devoted to the needs of motor cyclists, and as few firms hereabouts have petrol licences the firm has made arrangements to supply small quantities of motor spirit to motor cyclists.

A New Generator Holder.



Samuel Hall and Sons, Ltd., Wrottesley Street, Birmingham, have introduced a new generator holder, which we illustrate. This holder is for use with any generator that can be held by side fixings. If it be wanted to fix a generator unprovided with the necessary side attachments in any other place on the machine than where it was originally intended a series of bands can be supplied by the same firm, which are made in all sizes from 2⅜in. to 3¼in. diameter. The band in the sketch is 3¼in. diameter. The introduction of these attachments makes it possible to fit a generator on any single tube of either motor cycle or sidecar.

"A. S. L."

"RIDING ON AIR."

"RIDING ON AIR."

The last word in comfortable riding.

Note the neat disposition of the air springs on front and back forks.

PROOF OF RELIABILITY.
LONDON to EXETER GOLD MEDAL A.S.L.
Only one entered, with the above result.

EASE AND LUXURY

In riding, no matter how rough the roads are, assured the rider of an A.S.L. No shocks of any kind are felt, both wheels being sprung. The machine can be driven in any traffic or country without removing the hands from the handle-bars. Other interesting details will be found in the A.S.L. booklet, post free on request.

NO MOTOR CYCLE IS BETTER THAN ITS ENGINE!

The 1912 REX-J.A.P. has the strongest frame; the best system of front and rear springing; large comfortable footboards; automatic and auxiliary hand-pump lubrication—*and in addition to these and many otherluxurious and exclusive devices,* the famous J.A.P. Engine, the

MOST EFFICIENT POWER UNIT

in the World.

The REX-J.A.P. will take you over hill and dale, through crowded traffic, and over greasy city streets, with the maximum of comfort and the minimum of trouble, and without the hands leaving the handlebars. Most hills can be taken on top gear, an immense saving in wear and tear to the machine, and a great increase in comfort to the driver. The 650 x 65 Dunlop Voiturette Driving Tyre and brazed-on lugs for sidecar will be appreciated by the motorist who sets *value before cheapness — no other motor cycle combines to such a degree the merits possessed by the REX-J.A.P.*

Write now for Catalogue, it will interest you.

TO DEALERS—The REX-J.A.P. Agency proposition is worth consideration—we invite your correspondence.

COLONIAL AGENTS—The REX-J.A.P. Colonial Models, with *Special Frame, Wheels, and increased ground clearance,* will interest you. We are now appointing Sole Agents, and shall be pleased to post you terms.

Verbum Sat Sapienti

and to those men I appeal this week. No doubt many of you read the startling announcement made by a competitor last week. He accuses his fellow traders of offering ridiculous prices for second-hand machines, and after deluding **the unfortunate motor cyclist** into sending his machine along, he tries to **"do him in"** by **instead of allowing him the price he quoted him, he doubles it, and gives him twice as much as he agreed to allow him.** I am afraid if there is such a man in Great Britain we ought to get up a testimonial and present it to him. **"He is too honest."** I want to impress on any intending purchaser of a new motor cycle, and who has already a **second-hand motor cycle** that he is desirous of exchanging, that he should get in touch with me. **I will quote a price that I can, and will, allow him for same** if the machine is exactly as described. **You can't get anything fairer than this.** I am gradually building up what promises to be the largest motor cycle business in the country, and, by employing honest methods, I hope to achieve my object. Send to me for the name of my nearest client to you, and I will stand or fall by his report. Ask him how I did business with him, and I am sure you will then come to me. My delivery dates can be relied upon. If I say I can give delivery of, say, a Clyno on the 1st day of February, **I can do.** The same remarks apply to any of the following makes: Singer, Rudge, Rover, B.S.A., Douglas, Enfield, Premier, Bradbury, and New Hudson. I can almost deliver all these makes from stock. Now, hurry up, boys; try me with your next order. You will be delighted with the way I treat you. Everybody knows Cordingley, the man with a thirty years' connection with the cycle and motor cycle trade. My list is worth your perusal.

1912 models actually in stock awaiting your cheque and instructions.

	List price.

EAGLES.—Rex, 3½h.p., magneto, dropped frame, spring forks, 1911 B. and B. carburetter; £18/10.

EAGLES and Co., High St., Acton.—N.S.U. West London district agency. Early delivery of 1912 models; liberal allowances for machines in part payment. Tel.: 556 Chiswick.

MOTOSACOCHE, 1¼h.p. free engine, h.b.c., very good condition, complete, like new; £14/10.—1, Addison Bridge Place, Kensington. Tel.: 5215 Western.

BAT, 1911, T.T. twin, special machine, just been re-enamelled black, a flier, and in perfect condition; £45 lowest.—66, Carlton Mansions, Maida Vale.

TRIUMPH, 1912, free engine, new light wicker sidecar, canoe front, apron, stand; immediate delivery; £62; no offers.—94, Gloucester Rd., S.W.

WRENCH'S Motor Cycle Department, 120, Hampstead Rd., agents for all best makes; exchanges a speciality. Get our quotation. Tel.: North 3541.

SINGERS, 1912, free engine and lightweight models in stock.—Wrench's, 120, Hampstead Rd. Cash, gradual, or exchanges.

BRADBURY, free engine, 1912 model; immediate delivery, complete with lamp, horn; 50 guineas.—Wrench's, 120, Hampstead Rd.

WRENCH'S have a good selection of second-hand motor cycles; list on application.—120, Hampstead Rd.

REX 3½h.p. Tourist, as new, 1911 model; open to reasonable offers.—Wrench's, 120, Hampstead Rd.

2½h.p. Kerry Lightweight, magneto, Brown-Barlow carburetter, b.b.c., low, excellent condition throughout; £12/10.—Seen at 92, Brownhill Rd., Catford.

MAGNETO, 3h.p. N.S.U., tyres nearly new, m.o.v., h.b.c., spring forks, carrier, stand, splendid order; bargain, £12/10.—61, Grand Parade, Harringay, N.

1912 3½h.p. L.M.C., variable gear pulley free engine, new, unridden; exchange good combination, or sell £45.—Box 9,289, *The Motor Cycle* Offices, Coventry.

LOOK.—1911 3½h.p. Lincoln Elk, equals new, guaranteed; £23/10; motor cycle part wanted, combination, cheap, cash.—Seahaven, Sea Rd., Felpham, Bognor.

DOUGLAS, 2¾h.p., late 1909, splendid condition, all accessories; £21; would entertain exchange good sidecar combination.—Shillaw, 37, Atherton Rd., Forest Gate.

BRADBURY 1912 models, Douglas 1912 models, Triumph 1912 models, Premier 1912 models; deliveries now from stock. — Walker's, Motor Depot, Harwich.

WALKER'S Bargain List.—Douglas, 1911, 2-speed free engine, ridden only 800 miles, perfect, £35; Moto-Reve, twin, 1910, as new, ridden only 600 miles, £24; Moto-Reve, twin, 1909, a fine beauty, perfect, £18; Rex, 3½h.p., 1910, 2 speeds, free engine, grand condition, £26; Rex, 5h.p., twin, 1910, powerful, fast, grand condition, £25; several other reliable machines from £7; write for details, all guaranteed bargains; offers and exchanges entertained. — Walker's, Motor Depot, Harwich.

3h.p. Peugeot, Roote and Clarke's, 2-speed gear and free engine, chain drive, Palmer cord tyres, good running order; £10.—W. Elco, Brentwood Rd., Romford.

3½h.p. Kerry, Bosch magneto, B. and B. carburetter, mechanical overhead inlet, Clyno pulley, sound everywhere; £14.—Brown, 14, Pix Rd., Letchworth, Herts.

REX de Luxe, 5h.p., 1909, 2-speed, magneto, Whittle, Amac, footboards, usual Rex fittings; seen by appointment; £30.—Maw, 18, Addison Rd., Kensington, London.

MOTOSACOCHE, perfect condition, Palmer tyres, pulley, belt, and accumulator, all new; bargain, £14; will take cycle part.—Gasson, draper, Hurst Green, Sussex.

TRIUMPH, 1909, hardly used, lamp, horn, tools, spares, spring seat pillar, heavy Kempshall back, new Lycs; reasonable offers.—155, Brockley Rd., Brockley.

REX Motor Cycle, in running order, accumulator, Palmer tyres, new B. and B. carburetter, footrests; can be seen at 41, Market St., Watford; £15.—Baughan, Watford.

2h.p. Motor Cycle, vertical engine, Longuemare carburetter, long handle, Moseley tyres, splendid condition; £6.—Murray, 37a, Charles St., Hatton Garden, Holborn.

In answering these advertisements it is desirable to mention "The Motor Cycle."

A Warning Note.

IN our remarks about the T.T. Race which appeared in a recent issue we expressed the hope that, wherever the race might be held, participants, their helpers, and spectators, will be merry and wise, and let their "hosts" see that they can be happy and enthusiastic without giving way to any objectionable hilarity. We are well aware we are treading on delicate ground, but the time has arrived when immediate steps should be taken to eradicate a certain discordant note which is now being heard at all gatherings, which certain members of the motor cycle community attend. Shouting, singing, and interruptions during speeches and musical entertainments are not conducive to the good reputation the movement should bear, while the same conduct at meal times in hotels during the progress of competitions has an even worse effect.

It is obvious that only a very few, whose enthusiasm gets the better of their discretion, offend in this manner, but the nuisance has reached such a stage that all who have the good name of the motor cycle pastime at heart should take immediate steps for its suppression.

The kind of behaviour we have had most reluctantly to refer to is, besides being harmful to the pastime, discourteous to ladies who may be present, and brings those responsible for the proper conduct of the event into discredit.

The remedy is in the hands both of the organisers of any event at which the behaviour occurs, and of other people who know how to behave, but do not express their disapproval in a tangible manner. A drastic remedy would be ejection of the offenders from the meeting and suspension from so many club competitions during the year, and if the offenders persisted after that in disturbing their fellow members summary ejection from the club should be the punishment. We regret extremely that we should feel compelled to refer to this matter, but something ought to be done to prevent repetition of such conduct or the motor cycle movement is bound to suffer in prestige.

This Year's Competitions.

THE long list of fixtures already published does not represent all the competitions which will be held this year, but it represents the greater number. The A.C.U. Six Days' Trials and the Tourist Trophy Race shine conspicuously among the open events. The fate of the latter is somewhat obscure at present, but it will undoubtedly be held. The rules for the Six Days' require careful consideration, as last year's were certainly somewhat elastic, and there is no doubt that the speed between controls will have to be reduced. There is, however, one insuperable difficulty, and that is that it is impossible to observe a motor bicycle properly. All one can do is to give a man a schedule and bid him keep to it, assuming that if he is late it is the fault of his machine. With regard to the important question of silencers, we would suggest that it is no use sealing all cut-outs and then discovering that a machine not fitted with one of these devices is more noisy than if it were, because either it has no silencer or the one it possesses is, as regards noise, worse than if the cut-out were open. A glance at this year's fixture list is interesting and instructive. Every sort of competition is included, there is plenty of variety, and a sufficient number to satisfy an enthusiastic motor cycle public.

ENGINE POSITION.

INCLINED VERSUS VERTICAL ENGINES.

FOR dealing with a subject upon which small prejudice exists—upon which opinions do not differ fiercely—the writer craves indulgence. Readers may be reminded that the small beginnings of such a great movement as the coming of the motor cycle are quickly and easily forgotten—that the initial causes leading to the general adoption of this or that particular feature, though trivial in themselves, have far-reaching effects. Thus in the early days, motor bicycles with inclined engines were far more numerous proportionally than they are to-day, but in the thousand miles trials of 1903 all the highest awards were carried off by the vertically engined machines which were then in a minority. Their numerous but unsuccessful rivals suffered from many defects which may be broadly summarised by the statement that they were adaptations of the ordinary or "push" type of bicycle with engine, tanks, etc., attached somehow, somewhere! Their rivals, on the other hand, contained the germs of modern practice, the tendency of which is to design the machine throughout as a motor vehicle and not as a compromise. Fig. 1 will serve to recall some of these antique models, in which the power plant was often attached to the front down tube of the frame by flimsy and inadequate clips appearing to have been added as an afterthought. Modern examples of machines with inclined engines, though few, are extremely successful. They differ immensely from their early prototypes, and their success lies in the fact that both engine and machine are admirably adapted to each other, and combine together to fulfil their purpose.

Rise of the Vertical Engine.

Now it is more than probable that the results of the trials of 1903 gave a very serious set back to any and every form of construction involving an inclined engine, and a corresponding fillip to the type which has now become almost standard. There is, however, no magic in the principle of the vertical engine, and had both types been equally well designed in the beginning the standard machine of to-day with single-cylinder vertical engine, diamond frame, and horizontal tank would not now be with us in its thousands. This contention is borne out by the fact that two of the most successful machines of the present day not only have their engines inclined, but, with other features radically different from the standard type, are able to command higher prices than some of their rivals. So much for the commercial argument. The writer is well aware that events now almost forgotten have guided the course of design into certain grooves in which it is now inclined to stagnate. Therefore the object of this article is to point out generally the desirability of extricating ourselves from these grooves, and particularly the very real advantages which belong to an inclined engine position. In the case of a single-cylinder engine or twin with cylinders side by side, as may be seen from fig. 2, the cylinder head projects well forward and so catches the first rush of cooling air; the exhaust gases may be led away without a bend in the pipe near the cylinder where their temperature and pressure are high. Speaking more generally, the position lends itself to a great variety of frame designs, and in particular to the open frame, which opens up a new field by adding the motor bicycle as an additional weapon to the armoury of the fair sex.

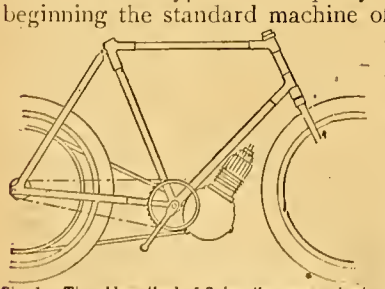

Fig. 1. The old method of fixing the power plant

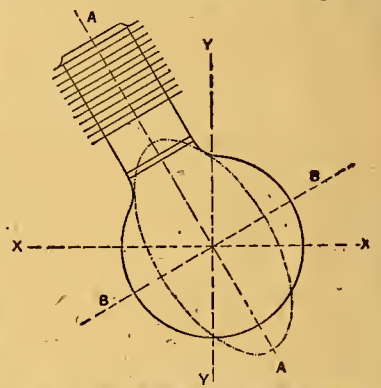

Fig. 2. Position for single or twin cylinder (side by side) engines.

It is easy to allow plenty of head room to the engine and to arrange a most satisfactory water-cooling system on the thermo-syphon principle, since the top of the cylinder is lower down and further forward, so that a tank can be arranged giving a good head of water over the combustion chamber. Fig. 3 shows a frame designed to take an inclined engine, and it will be noticed that the structure has no strength without the engine. A simple rear springing device, which is intended to allow about an inch of movement to the back wheel, is also shown. The attachment of the engine can and should be such as to form an integral and essential part of the frame without which the structure would collapse. In my opinion, a machine with frame and engine built up in this way makes a job which is stronger, more rigid, and freer from vibration than is the conventional design. On this question of vibration some nice points arise, though to deal thoroughly with them is not within the scope of this article.

Methods of Balancing Motor Cycle Engines.

Referring to fig. 2, the usual method of balancing or attempting to balance a single-cylinder motor cycle engine is to thicken the flywheel rims as shown, thus adding a certain mass, the centre of gravity of which is opposite to the crank pin centre. Practice varies from the balancing of the rotating parts only, that is to say the crank pin and big end, to the balancing of the whole of the reciprocating parts. The latter extreme is bad, and the best practice is to be found near the former, the piston being kept as light as

Engine Position.—

possible. Now in the case of the vertical engine, in which such a mass has been added to the flywheels as to balance the rotating and part of the reciprocating parts, the rotating parts alone will be overbalanced, and consequently there will be an unbalanced force X acting along the line X X; incline the engine and it acts along B B. Let us see what happens in the case of the inclined engine. Neglecting secondary forces, that is to say, assuming simple harmonic motion for the piston, which assumption is only justified when the connecting rod is extremely long, we have, considering the forces acting in any position of the system—(1) a force due to the acceleration of the piston acting along A A. (2) A force due to the centripetal acceleration of the excess of M over the rotating parts M', the resolved component of which along A A partially balances the force due to the reciprocating parts.

Finally we have the resolved component of 2 along B B.

Now on the above assumption the force along A A reaches a maximum at each end of the stroke (passing through zero at the middle of the stroke). The force along B B reaches its maxima when that along A A is zero and *vice versa*, *i.e.*, at intervals of 90°. It will therefore readily be seen that by plotting the

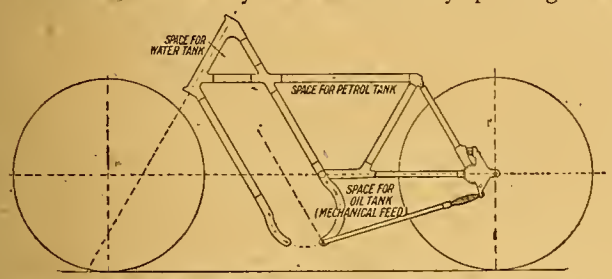

Fig. 3. A frame for inclined engines. It will be noticed that without the engine the structure has not much strength.

resultant force throughout a complete revolution we get an ellipse which becomes a circle when the maxima along A A are equal to those along B B, that is to say, when the factor due to overbalanced rotating mass is just equal to that due to underbalanced reciprocating mass, or, in other words, taking an arbitrary case in which the rotating and reciprocating parts are of exactly equal mass, M will be 1.5 times this mass.

The chief point which arises from the above argument is this, that in the case in which the ellipse becomes a circle, the inclination of the engine makes no difference whatever. Usually A A will be the major axis, in which case the inclined engine will have a slight advantage, since a resultant force in this direction is likely to be rather less objectionable than a vertical vibration, and it has already been said that to increase the balance mass M so as to make B B the major axis is bad practice in any case. In the case of the vertical engine the resulting horizontal vibrations might be expected to have a direct effect on tyre wear, and, in the case of the inclined engine, the vibration along B B might affect the rider.

These theoretical considerations, however, do not cover the whole question of balance. Much depends upon the attachment of the engine and the rigidity or otherwise of the frame, and in these respects the inclined engine offers possibilities of superiority.

Distribution of Weight.

The ground clearance and the wheelbase of the machine may without freakish design be as great or as small as is desired, whereas the former in the case of the vertical engine is strictly limited by the height of the cylinder and the depth of the frame. Finally the centre of gravity of the whole machine is further forward; the combined weight of machine and rider and luggage more rationally distributed between the two wheels, with the result that the machine holds the road and does not skid. This is a most important point, and is amply borne out by experience. It is an undoubted fact that the standard type of machine when fully laden carries too much weight on the back wheel and too little on the front. Tyres therefore should wear more evenly on the inclined type for this reason and on account of the horizontal vibrations dealt with above, which are an essential, though not very noticeable, feature of vertically-engined machines. In this connection the comment made on the Scott machines in the Isle of Man is interesting. It was said that they stuck to the road like postage stamps. The comparison is not altogether apt, because these vehicles cannot be compared with anything so "*stationary*" as stamps. Another instance—the Holyhead road between Corwen and Cerrig-y-Druidion is often spread with white, delicious butter. Faring along there one day with a companion mounted on a well-known chain-driven machine with inclined engine, the writer on a standard belt-driven single, both with luggage, we made a progress slow and full of thrills. He (the writer) brought up the rear at a steady speed, and was thus able to notice his companion's tracks, and that the regular impulses of the latter's single-cylinder engine were each distinctly marked on the road. Yet he did not skid, the steadiness of the machine, due to a better distribution of weight, more than counterbalancing the effect of a comparatively harsh chain drive.

Lubrication.

It is interesting to notice that every V twin is essentially an inclined engine, and the persistent success of this type is very significant. Now in the case of the V twin, the oil which is being swept round by the flywheels finds its way first to the rear cylinder, and then any that is left over, so to speak, passes on to the front cylinder. It is a misconception to regard the conditions of lubrication in a single-cylinder engine inclined forward as similar to those in the front cylinder of a V twin, because there is no rear cylinder for the oil to pass into. Just as much oil will leave the crank case and pass into a cylinder inclined at any angle as into a vertical cylinder, or slightly more, including the small effect of gravity.

It may well be asked why, with so many advantages, machines with inclined engines are not more numerous. The answer is, as suggested at the beginning of this article, that the standard type of to-day has become the fashion through a series of trivial and long-forgotten accidents.

Finally, to sum up, the most important advantages claimed are these: (1.) Better cooling. (2.) Freer exhaust. (3.) Adaptability to open frame, water cooling, etc. (4.) Strength, rigidity, and balance. (5.) Distribution of weight. (6.) Lubrication. B.S.

Occasional Comment

By Lyon

An Interesting Development.

The success of three-speed hubs is having wide effects, and I hear that several leading firms who hoped to meet the demand for variable gears by offering two-speed counter-shaft gears are revising their plans for 1913. One firm in particular are great sticklers for a simple and accessible back wheel, and they are experimenting with a light and compact three-speed counter-shaft gear. We old-timers, who have pushed variable gears against all the inertia of indifference and ridicule for so many years, are taking fresh heart of grace. It looks as if two-speed gears might be out of date in a year or two, when multi-speed gears begin to figure in every catalogue.

Waterproofs.

During the last ten years I have sampled practically every well-known brand of rubber-proofed garments on the market, both cheap and costly, and my experience is that a genuinely drencher-proof set are very expensive to buy, retain their quality for a comparatively short period, and are excessively steamy and ill ventilated in use. Within the last three years I have owned two sets which I could absolutely trust to keep out the heaviest downpour for a day at a time. But their cost was prohibitive when I took into account the dangers of ripping them in use, and I had to replace both before they became porous. In addition the slightest labour in the way of starting the machine or wheeling it about threw me into a very heavy perspiration, and I must say that I am a convinced "oily" man to-day. If somebody would invent an untearable rubberproof, I would recant, but until that happens I shall continue to pose as a sea dog.

Spring Saddle-pillars.

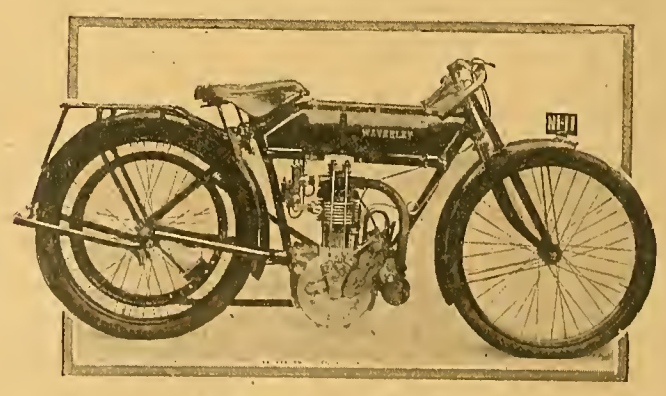
Will makers of rigid frames and springless saddle-pillars kindly notice that spring pillars are being adopted on many of the latest models in the United States? The sickening jar up the spine, communicated to the rider by bumping over a hump with a rigid rear frame, is the only feature about the motor bicycle which is likely to affect the health of the most delicate person, and it is high time steps were taken to insulate us from it.

The function of a saddle is to fit our anatomy comfortably, therefore the insulation from road jars might well be transferred to another portion of the machine, where there is lots of room to experiment with springs of greater length and elasticity than those which can be fitted to saddles. It is hardly fair to expect our saddle makers to provide perfect insulation in the small amount of space at their disposal, and good as some of our saddles are, they would be vastly improved by the more general adoption of spring saddle-pillars.

Shaft Drive and Seized Engine.

I doubt whether correspondents are quite fair in accusing the chain of being quite as dangerous as a shaft in the event of a seized or jammed engine. If the engine ceases to revolve it is practically impossible for a shaft to free itself, at least it has been so in every actual case that has ever come under my notice. The chain may easily fail to free itself under similar circumstances, but I have known of many cases where the chain has freed itself. In some instances it has snapped under the sudden strain; in others the sudden check has caused it to mount the sprockets and fall harmlessly off, thus giving the rider a chance to maintain equilibrium.

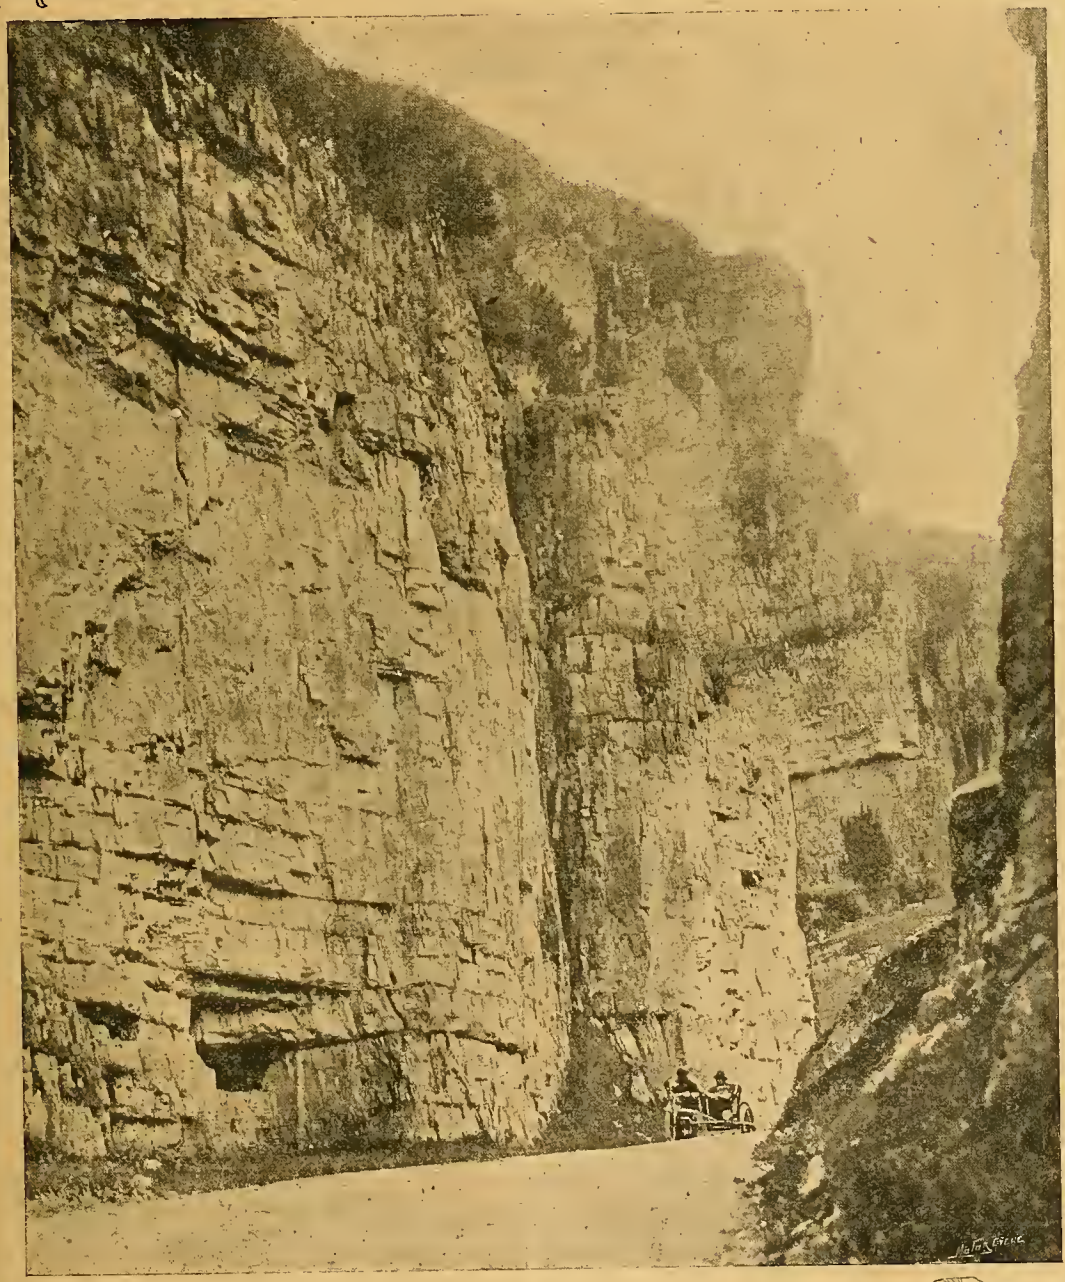
I repeat that the great merits of the shaft drive lie in the ease with which it may be encased, and the handsome appearance of a machine thus equipped. The introduction of a reasonably smooth acting clutch should usually allow the road wheel partly to over-run in the event of engine seizure, but even with a tight belt it is not a nice experience to find the engine suddenly at a standstill and the rear wheel skidding along in an endeavour to unseat the rider.



The Tourist Trophy in America.

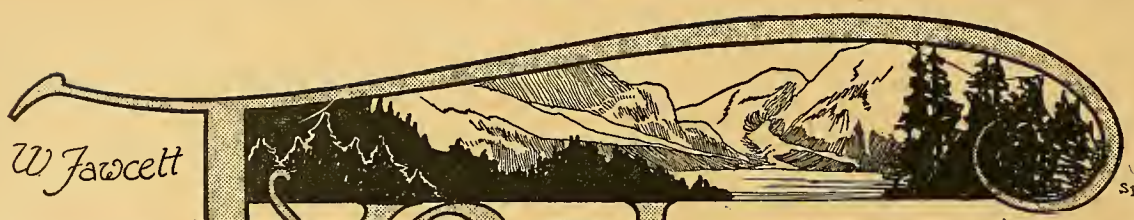
I hope our expert riders, leading designers, and manufacturers will not forget that the Tourist Trophy graced the Indian stand at the New York Show in Madison Square Garden, that it will also be again seen at the Chicago Show, and that they will spare no effort to bring the cup back in time for next Olympia.

With the exception of one or two leading makes the American industry still lags behind. Only four or five makes are equipped with variable gears, and most exhibits make a big talking point of the free engines which have long since been commonplaces on this side, while the samples shown do not compare favourably with our best clutches.



Surely the rough surfaces and badly engineered roads in the States must render variable gears a far more urgent necessity than they can ever be in Britain.

Judging from outline illustrations, some of the Yankee machines are not improving in beauty; many samples remind me of a rheumatic camel, laden with a travelling gipsy's impedimenta. The outlines are often crude, and many of the fittings are glued on with a sad lack of artistic perception.



The above machine, ridden by T. Green, won the Rudge cup in the Dublin and District M.C.C. 100 miles open handicap race on Portmarnock strand. The engine is a Waverley, an American production, measuring 3⅜in. bore and stroke, and having overhead valves, auxiliary exhaust ports, and ball bearing crankshaft. The frame and fittings are by Chater-Lea.

Summer Memories

In Cheddar Gorge, Somersetshire.

SRJ

By W. Fawcett

TO THE TYROL AND BACK ON MOTOR CYCLES

(*Continued from page* 71.)

Next morning was beautifully clear and fine, so we set off in high spirits for the eagerly looked forward to Stelvio Pass, but we had not gone far before Grange had to stop to retime not only his ignition, but his valves as well, before he was satisfied.

On mounting a steep hill in a village, my Matchless pulled half a fastener to little bits, but we were soon on again, over dusty and bumpy roads, through Meran, the ancient capital of the Tyrol, and then Neu Sponding, after a run of about fifty miles. Being now at the foot of the Stelvio, we stopped to consult the map, etc.; also I lowered my gear to the very lowest possible (5¼ to 1), whilst Grange put his at 6 to 1.

The Famous Stelvio Pass.

A few remarks on the Stelvio Pass will perhaps give the reader a better idea of what was in front of us. It is the highest Alpine highway, and there is not even one in the Himalayas to rival it. The Austrian side is more difficult, as the gradient is steeper and there are more hairpin corners, whilst the altitude at the bottom is 2,940 feet above sea level, and I think I am right in saying that no British high road goes as high as this, not to mention *starts* there, whilst the top is just over 9,000 feet above sea level. There are therefore over 6,000 feet to climb in a distance of fifteen and a half miles, this giving an average gradient for the fifteen and a half miles of 1 in 13. This you may think is not steep, but with forty-six hairpin corners to negotiate it is rather difficult, and I may add that motor cyclists who have seen very little worse than the Sutton Bank corner, and the so-called "hairpin" from the foreshore to the town at Saltburn, simply do not know what a hairpin corner is. The road is not cleared of snow till the middle of June, and before then it is, of course, impassable for traffic.

But, to return to how we fared, I found the gradient easy at first, and had done about three and a half miles when I spotted the Bradbury propped up, but I saw no Billy, so I kept going, passing over the Trafoi-Bach three or four times by bridges that span this turbulent river. The gradient seemed to be getting steeper, so I opened the throttle a little more. I remember very little of the road till Trafoi was reached, which is about halfway up, and is a magnificently situated village with a palatial hotel. I was ambling along, gazing about me, when—"Great Scott!" too late, I found a hairpin to the right, and, as I was going about ten miles an hour, and almost every one of the forty-six hairpins cannot be ridden up at over six miles an hour, I soon came to a standstill; but, with a heave, I ran a few yards and was again climbing. Oh! those hairpins! The narrow shaves I had as I sneaked round one after another, till once more I came to one that again proved my undoing, so I put the bicycle on the stand and waited for the Bradbury. I could see very little of the road, as it was much hidden by pine trees, but I soon heard Billy coming, first slowly, then a roar, then "Bang! Bang!" several times repeated, as he gingerly took corner after corner; then he came to the one approaching the spot where I was resting. I could hear him shut off as he caught sight of it, then he appeared round the hairpin and opened out, but he was going too slowly, so finally stopped and placed his machine alongside mine, while we exchanged experiences about the corners. Again we set off. This time I was first, and round hairpins galore I wriggled till I was nearly dizzy. I espied a spring splashing merrily into a small wooden tub, and, although the bicycle was pulling well, I could not miss the chance, and dismounted to have a refreshing drink of the icy cold water. Grange soon came up, and did likewise, but, in addition, emptied the whole tub of water on to his engine—a proceeding I thought very silly, but, as luck would have it, the cylinder was not cracked.

With a now cold engine, the Bradbury set off again, whilst I soon followed, to be pulled up a mile or two on at a large hotel at Franzenshöhe, where, almost in the shade of the loftiest peak of the Tyrol, the magnificent Ortler (12,800 feet), and in sight of the Madatsch glacier, we went in for something wet and cold. This hotel makes a good resting place for the enormous numbers of walkers, etc., not forgetting a quantity of diligences with anything from two to six horses.

Grange again set off, and I followed. More hairpins and many breathless moments, in one of which I again ran into a gutter, and could not get under way again. There were only about four more corners to the top, so, with a cheery hail from my companion, I set off and soon reached the summit.

Winter and Summer in One Day.

We arranged to spend the night at the summit, and got rooms at the Hotel Ferdinandshöhe, the day's run being sixty-eight miles. The road up was in very good condition, and whilst at the bottom we were sweltering in the heat, we found there were huge banks of snow within a few feet of the hotel door, and this was the end of July!

The frontiers of Austria and Italy join at the summit, and the proximity of forts in the neighbourhood forbids any photography, but I got permission

To the Tyrol and Back on Motor Cycles.—

from the customs officers to take a photograph of the hotel and the said officers outside enjoying a meal.

I cannot describe the pass better than by saying that the corners almost beggar description, and the road is like a jumping cracker gone mad. The view, as is to be expected, is magnificent with the snow-clad Alps all round, and as evening wore on the sunset was a sight never to be forgotten, whilst in the distance intermittent flashes of lightning lit up the glistening peaks.

We each had five stops during the ascent, but we took things easily, and did not fag ourselves once. We were quite satisfied, taking all things into account.

Next morning, Wednesday, the 26th, after an early breakfast, I went into the custom officer's room, and was paid back without any trouble the £9 duty we had paid on our machines on July 21st. The £9 consisted of about fifteen notes that looked more like dirty red blotting paper than anything else.

We now began the descent, and soon came to St. Maria, where we presented our C.T.C. tickets at the Italian Customs House, and were given a permit, while seals were affixed to our machines without any trouble. I may here say that we had had our seals and huge number plates for Austria taken off at the summit as we left Austria.

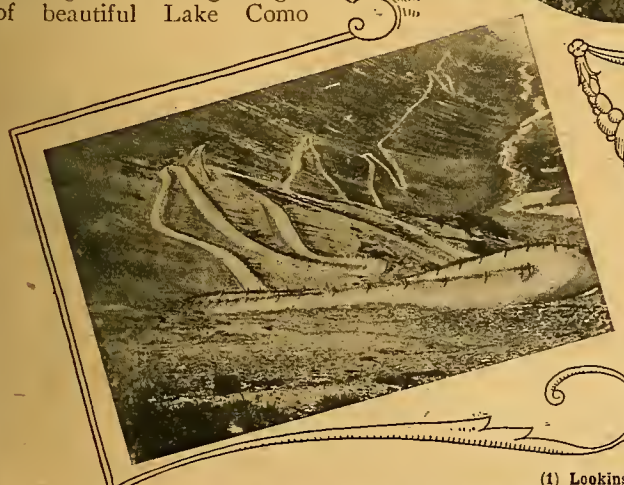
The descent down the Italian side was great fun, for we now took the hairpins easily, and on one was a huge drift of snow, which Grange jumped on in exhilaration. We passed several score of carbineri with mules laden with what appeared to be Maxims, and went through a few tunnels, with the water dripping down our necks. At last we reached the bottom with our engines practically cold.

By a fairly straight but very dusty and hot road we had a fast run through Bormio, St. Antonio, Grosio, Tirano, Trescendo, and Sondrio, till I was pulled up with a nail in the back tyre.

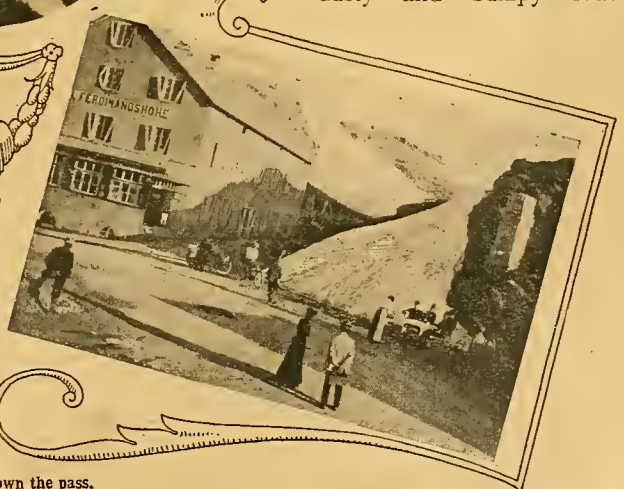
Shortly afterwards, through Morbegno, we caught sight of beautiful Lake Como glistening in the sun. At Colico we were at the lake side and we had a glorious run of about twenty-five miles along Como, through Dervio, Bellano, to Lecco, where, on consulting our handbooks, we decided to put up at the Hotel di Croce Malto, at which we found the charges moderate. The day's run was 106 miles.

Lecco proved very disappointing, and we decided to spend the next day at Como. A frightfully dusty road, very bumpy through Erba, and then a few long climbs brought us to Como, where we put up at the excellent Hotel Volta.

A pleasant day was spent at Como in having a welcome dip in the lake, etc. In the evening we were crossing the Place Volta when we heard a motor bicycle knocking horribly, and, strolling across, we recognised a well-known British make, which shall be nameless. The owner, an Italian, was quite pleased at the interest we took in him and his machine, but my offer to bet him 100 lire to one centisimi that he could not do the 120 kilometres *à l'heure*, which he said he could do, brought only a smile.



Next morning we set off, again on atrocious and dusty roads, through Varese, Gaviratè, to Laveno, where we decided to cross Lake Maggiore by boat to Pallanza, whence we continued our way. Near Gravellona are huge granite quarries, and the road was so awful we marvelled that we had broken nothing. Following the river Toce through Ornavasso, the mountains on each side gradually got nearer as if to hem us in, till we came to Domodossola, where we spent the night at the Hotel Terminus e Spagne, after a dusty and hot run of fifty-eight miles.



It was here that poor Chavez was killed after flying over the Alps, and there were grim mementos—picture postcards of the accident, etc.—that brought home to us the stupendous feat of that plucky aviator.

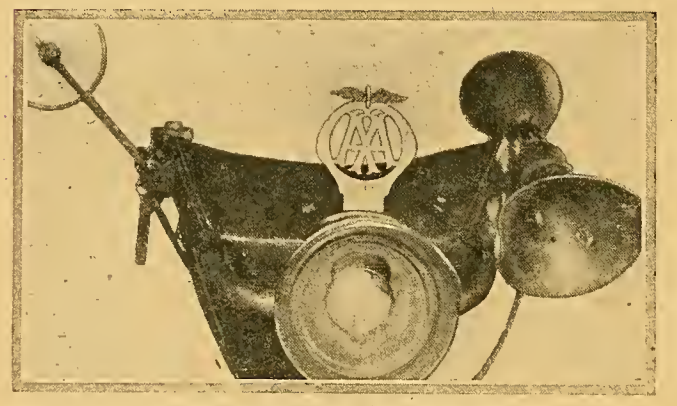
The following morning, Saturday, 29th, we left Domodossola and made our way by a frightfully dusty and bumpy road

THE STELVIO PASS, AUSTRIA.

(1) Looking down the pass.

(2) Something like hairpin corners! Nearing the top of the Stelvio, which is about 9,000 feet above the sea.

(3) At the summit. The customs officers may be seen to the right of the photograph. The snow in the background will be noted, also the hotel.



To the Tyrol and Back on Motor Cycles.—

towards the Simplon Pass. We had done about ten miles of undulating road with some very steep pitches, on lowered gears, when we came to Iselle, where the new Simplon railway tunnel ends with its yawning mouth close to the road. We could see a huge bank of snow now and again just off the road, and at Iselle we were stopped by the Italian Customs, where our seals were removed and our permit given up, as we were now leaving Italy. About six miles further on we again had to stop, this time at Gondo, where the production of our C.T.C. tickets gave us free entry into Switzerland again. This was not all, however, as we had to get an authorisation to cross the pass, which costs two francs each motor cycle. The Swiss customs officer would not take Italian money, but he was careful to give me three huge Italian five-lire pieces in change.

We also had to conform to the obnoxious regulations which say that you cannot cross the pass on a Thursday, the time for the twenty-four miles must not be faster than six miles an hour, and the time you can be let out at the other end is written on the permit and must be given up at the other end; corners must not be taken at over *two* miles an hour, you are not allowed to start before 9 a.m. and not after 5 p.m., and a lot more silly regulations; whilst for infringing any of them you are liable to a fine not exceeding £24.

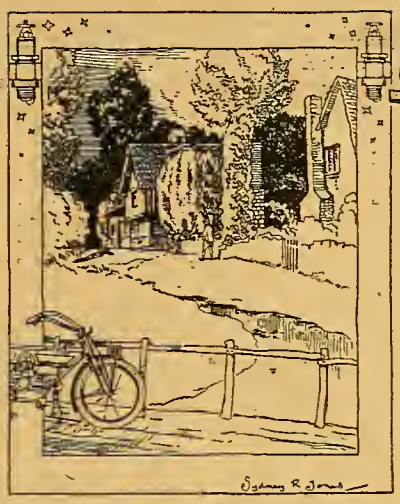
(To be concluded next week.)

WHICH IS THE BEST METHOD OF EXHIBITING A BADGE?

An A.A. badge attached to the rear of the lamp.

WHICH is the best method of attaching a badge to the handle-bar of a motor cycle? Some A.A. motor cyclists complain that there is not sufficient unoccupied space for the badge to be attached directly to the bar, and often when there is room there are too many other impedimenta such as mirrors, horns, watches, speedometers, and the like to render the badge clearly visible to the patrols. Obviously the best place is in the centre of the machine, and the badge in some cases is attached to the rear of the lamp (as in the case of the machine illustrated), which is an excellent position with the sole objection that the lamp is seldom sufficiently strong to carry it, but lamps vary so much in design. Some motor cyclists carry the badge on the number-plate. On the whole a support from the top tube would seem to be as suitable a place as any.

A TRIAL OF THE LUKIN CARBURETTER.



NOT long ago we described in these columns the new Lukin automatic carburetter. Since then we have had the opportunity of giving it a thorough road test on one of our machines. The Lukin has given great satisfaction under all conditions; it enables the engine to run extremely slowly (slower, in fact, than any standard carburetter we have tried), and at the same time the engine will pick up at once on suddenly opening the throttle without any of the hesitation which is a feature on only too many present-day carburetters. We found that we could get just about the same power and speed as with the ordinary two-lever carburetter, while the steady slow running and quick pick up with the single-lever control renders it particularly pleasant for use in traffic. It will be remembered that after closing the throttle a further movement of the control lever permits the ports to be opened again, and allows cold air only to be drawn into the engine. This is very convenient on a long hill, as it has a good cooling and scavenging effect on the engine, but the makers' instructions should be carefully carried out, and the ports should remain closed for a perceptible time before using the air brake, otherwise any loose petrol in the chamber is carburetted, and has the effect of opening the throttle for several revolutions. Adjustments are very simple, and can be carried out by the merest novice. The use of the single-lever control combined with the air brake permits one to drive on the throttle only, and it is hardly ever necessary to use the exhaust lifter.

The Lukin single lever carburetter fitted to a 3½ h.p. Centaur.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

Taking a Sidecar to India.

Will you be so good as to inform me on the following points, for which I shall be greatly obliged: (1.) Is a solid crate of wood, as opposed to an open lattice wood crate, required by the shipping companies for the transport of a motor cycle and sidecar? (2.) Which would be more economical, having one crate made for both in combination, or a separate crate for each? (3.) Can you give me the names of any companies who undertake this kind of work? My machine is an 8 h.p. Bat and sidecar.—C.E.S.

(1.) It is best to pack in a closed case. You can get rates from Messrs. Turner Bros., 134, Upper Thames Street, London, which include cost of packing. Of course, there is an extra charge for the sidecar. (2.) Messrs. Turner always pack the machines so as to take up as little room as possible. Generally speaking, they find it more economical to have two separate cases. They recommend a closed case, as a crate renders the contents liable to damage and pilfering.

Lamps and Lenses.

I wish to buy a lamp for my motor cycle—the cheapest I can get—bar, of course, rubbish. (1.) Is there any objection to self-contained ones? I have seen a very neat one at 11s. 6d. Gamage advertises in *The Motor Cycle* a lamp at 12s. 9d., and generator for same at 8s. 6d. Is this reliable? (2.) What is the Mangin lens, and is it much superior? (3.) Why are the lamp glasses sometimes divided into several pieces? (4.) I am getting a second-hand 3½ h.p. Humber, and attaching sidecar. Would you alter the variable pulley so as to put same permanently on lowest gear? I intend to use sidecar continuously, riding chiefly in Cheshire.—F.J.A.

(1.) The only objection to the self-contained lamp is that it requires a stronger bracket than one with a separate generator. The lamp sold by Messrs. Gamage should be quite satisfactory. (2.) The Mangin lens is the name given to a certain type of mirror lens now fitted to most high-class lamps. (3.) The front glass of a lamp is divided so as to prevent cracking. Very often if a glass gets hot in one place it will crack, as glass expands excessively. When, however, a glass is divided into sections, if one section becomes hotter than the other it has more room to expand. (4.) Yes, unless you have a change-speed gear on your machine you will have to set the variable pulley probably at its lowest gear.

Four-cylinder Machines.

Is there anything against shaft transmission on a motor bicycle with a multi-cylinder engine that it is so rarely adopted? What is your opinion of the four-cylinder F.N. as a machine for a light sidecar in a hilly country? Does the number of cylinders introduce any complication which a person with some experience of a four-cylinder car cannot easily get over?—H.P.N.

The only thing against shaft transmission is that it is necessary to have a good clutch or some slipping device between the engine and the rear wheel, otherwise the drive is more harsh than a belt. Fitted with a two-speed gear, the machine would take a sidecar in average hilly country. The machine in question should present no difficulty to anyone who has had any experience with a motor cycle or car.

Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Charging Accumulators off Mains.

Could you kindly explain how I could rig up an apparatus off 240 volt mains to charge accumulators (four volt), and what I should need to get to do so?—RN 1375.

It is possible to charge accumulators off 240 volt mains, but very expensive unless you connect them up only when the light is required. If the current is continuous it can be easily done by removing the cover of a switch controlling one or more lights and attaching wires to the two terminals. The + terminal must then be attached to plug on the accumulator. To find the positive and negative terminals, dip the ends of the wires in a cup of water to which a little vinegar has been added. Bubbles will at once appear on the negative wire. Have two or three 16 c.p. lamps in circuit, but do not switch on in the ordinary way or you will short circuit the accumulator. If the current be alternating, it will be necessary to purchase a transformer. (See page 52 of our issue for the 11th inst.) For more detailed instructions see "Motor Cycles and How to Manage Them," pages 152-155, 1s. 2d. post free from 20, Tudor Street.

MOTOR CYCLING IN MID-WINTER.
Almost the whole of the country was covered in a mantle of snow last week. Our illustration shows a 6 h.p. Royal Enfield sidecar forging its way along under difficulties.

Belts and Sidecars.

I should be obliged if you could advise me on one or two points. I ride a 7 h.p. Rex with sidecar, and find the machine very satisfactory except with regard to belts—rubber ones wear out very soon, and leather ones get a lot of grit embedded in them; in fact, I find that I have to get the grit out with a shoemaker's rasp every 100 miles. I have fitted an extra guard between the back wheel and belt rim, but that seems to make little difference. Is there any other position I can place a guard in to keep the grit away? (2.) Would it make the machine more silent if I removed the silencer and fitted exhaust pipes as used in the T.T. race. (3.) Although my sidecar is a castor wheel and steers with no apparent side drag, I find the tyres on the bicycle wear very rapidly, even the front one, which seems to wear more on the sidecar side than the other. In all other respects I find the combination most excellent. —BL 1840.

(1.) It is only to be expected that a 7 h.p. with sidecar will wear out belts very rapidly indeed. See "Winter Mudguarding" in our issue of December 7th, 1911, and "Dodges on the Exeter Run," January 1st, 1912. (2.) Possibly if you fit an expansion chamber with, say, one baffle plate in it, and use a long exhaust pipe leading from this you will reduce the noise of your machine. (3.) Probably your front wheel is not quite in track. There should not be very much wear on the front tyre, though certainly a little more than if a sidecar were not used.

6 h.p. Twin for Sidecar Work.

(1.) Can you thoroughly recommend the 6 h.p. Zenith-Gradua motor cycle for sidecar work with a heavy passenger in a hilly country? (2.) Is it easy to control in traffic? (3.) Is the belt drive really as black as it is so often painted for sidecar work? I see in your answers to "B.P.B." and "DL 75" in the issue of December 28th, 1911, you advise chain drive for heavy passenger work. (4.) What is the petrol consumption with this machine and a sidecar? (5.) Is it easy to manage as a solo mount? (6.) What are the alleged advantages of the castor or spring wheel sidecar over the rigid type? (7.) Is a 2½in. Hutchinson rubber non-skid tyre strong enough for the back wheel of the sidecar combination in question?—LA 1877.

(1.) We can thoroughly recommend the machine mentioned in your letter. (2.) It is simple to control in traffic. (3.) There is no doubt whatever that when two people have to be propelled, chain drive is to be preferred to a belt; it should be economical, and also possesses the advantage of being unable to slip whatever the weather conditions may be. (4.) The petrol consumption would be about sixty miles to the gallon with sidecar. (5.) It should be easy to manage as a solo mount. (6.) The castor wheel sidecar is claimed to strain the frame of the machine less than the spring wheel or rigid types. It does not, however, prevent sideslip so effectually. The spring wheel sidecar, on the other hand, has another advantage over the other two, as it renders riding more comfortable for the passenger. (7.) We should recommend a 2½in. steel studded tyre of the same make.

Throttle and Air Valves.

I had noticed, like Mr. B. Sparks Field, the letter saying that too weak a mixture would overheat as well as a too strong one, and had reasoned it out similarly, consequently I was pleased to read explanatory letters in your paper. I have had a 5-6 h.p. cycle and sidecar about three months, but had been studying your books, "Motor Cycles and How to Manage Them," "Hints and Tips," and the questions and replies, etc., in your paper for months beforehand. From reading and talking with riders I understood that opening the throttle lever gave the engine more petrol, and the air lever, of course, more air. After taking my Amac to pieces I began to alter my ideas, and reading the letters seemed to confirm them. Now it seems to me that the air lever alters the mixture, and the throttle alters the amount admitted to the cylinders. Consequently, I came to think that by opening the throttle only a little the pistons would only be able to suck a half charge of a correct mixture, provided the air lever was in the right position. Am I right. If not, a full and lucid explanation of the action of the carburetter valves would enlighten not only me, but many others. As my machine travels too fast for my wife, I want to know how to travel slowly without overheating, and I want it explained to me how it acts. How are new platinum tips put on to the contact breaker screws? I cannot understand, if the separating of them causes a spark at the plug, why they can open too much. I can understand the necessity of the plug points being correctly set, as the spark has to jump them.—H.I.

You are quite right in the conclusions you have arrived at respecting your carburetter. The throttle controls the quantity and the air valve the quality of the mixture. To drive slowly you close both valves to some extent because less gas will be required, and at slow speeds the suction of the engine has less effect on the petrol in the jet, and, consequently, if the air were not cut off at all you would get too weak a mixture. Regarding your magneto queries. It is better to get new screws from the maker of the magneto than to attempt to re-tip them yourself. There are three reasons for the instructions that magneto points should separate only the correct distance of 0.4 mm. (1.) If the points separated too far there would be hammering between them. (2.) It would upset the timing. (3.) A flame passes between the points when they separate, and if the distance this flame had to travel was too great it would detract from the intensity of the spark at the plug.

Hiring on a Sunday.

I hired a motor cycle one Sunday morning, to be returned first thing on the following Tuesday morning. I rode over a hundred miles on the Sunday, and when taking the machine out on the following morning I found the wheel was rocking a little. I took it to a garage, and as it was Bank Holiday the people were unable to repair, but they took the wheel out the next day and did what they could, but informed me they thought one of the parts in the hub (free engine) fitted badly, and they tried all day, but did not seem to cure the fault completely, and thought the part ought to go back to the makers. I rode back on the Wednesday morning, arriving about eleven—a day and a few hours late, I take it. I informed the firm here what had happened, also what I had been told. They said they would soon put it right, however, and on enquiry a few days afterwards, they informed me the machine was running splendidly and had been a long journey. I broke three spokes through getting the brake caught; apart from this and the other trouble the machine was quite satisfactory. Two months have elapsed, and they have now sent me a bill for a lot of other repairs, and also charged me with double hire. The charge is nearly £3 10s., and I think it very unfair. I should be pleased to know if I have a right to dispute the bill, or am I liable to the charges? —H.C.G. (Oxford).

Our legal adviser writes as follows: "As the contract of hiring was made on a Sunday, the agreement was illegal, and therefore not binding on the parties. The question of paying for the hire of the machine beyond the period arranged for does not therefore arise. If it can be shown that your correspondent did any damage to the machine while he had it, through his negligent use of it, he will be liable for this. Should a summons be issued against him, it is necessary for notice to be given at least five days beforehand of your correspondent's intention to plead the statutory defence that the contract is illegal, under the Sunday Observations Act, 1677. It will also be necessary for him to have the repairer he employed there, to support him as to the reason of the damage done to the machine. It would probably be best to deny all liability in connection with the hiring and the damage, but to offer a small sum in settlement of the damage."

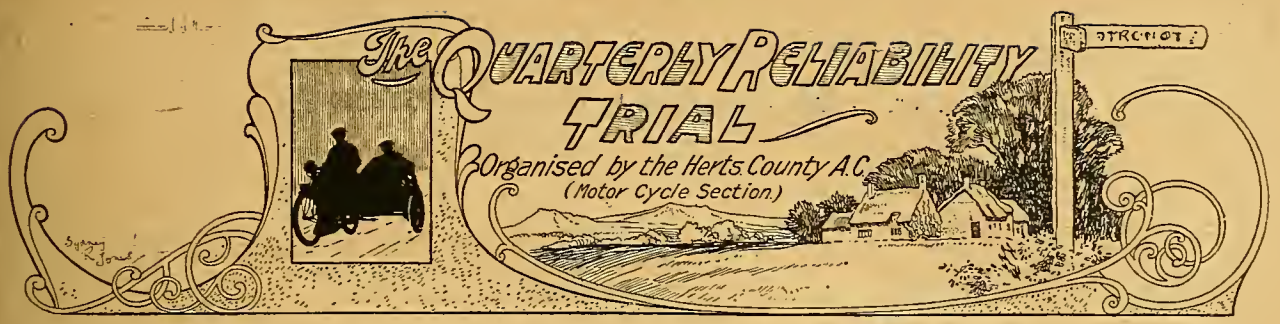
EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"M.J." (Glasgow). B.H.K. free engine hub.

"Oxter" (Oxford).—3½ h.p. Brooklands.

"H.S." (Newcastle).—Albion and Mabon free engine clutches.



"A.J.L.M." (Greenwich). — 3½ h.p. Zenith-Gradua with sidecar.

"K.D.Y." (Kent).—Fitting Albion clutch hub, what structural alterations are necessary to a 1911 Douglas?

"W.J.M." (Preston). — 2¼ h.p. Levis lightweight.

"C.T." (Newark).—5-6 h.p. four-cylinder F.N. with sidecar.

"F.J.F." (Cumberland).—5-6 h.p. Clyno and 5-6 h.p. four-cylinder F.N. (two-speed) with sidecars.

THIS trial, held on Saturday last, was to all intents and purposes a quarterly trial under new management. It will be remembered that the Motor Cycle Manufacturers' Union was the means of the Auto Cycle Union annual series of quarterly trials being abandoned at the end of last year; the Herts County A.C. filled the breach, arranged the start and finish of the first trial at Uxbridge, and yet the trade supported the event, including some firms, members of the Manufacturers' Union, which were said to be entirely against the Quarterly Trials.

Midland and North-country readers will read with surprise that the trial could have been held, as almost the whole country fifty miles north of London was covered in a deep mantle of snow. Wires to Mr. Cooke, the organising secretary, elicited the surprising information that there was no snow in London and the trial would be held. Entrants from the Birmingham, Wolverhampton, and Coventry districts were, therefore, obliged to train up to the starting point, and we heard of several who had been absolutely unable to test their machines on the road, and were considerably concerned as to how they would behave on the hills.

It was drizzling with rain as the undermentioned competitors were despatched by Mr. G. Smith, from the Chequers Hotel, Uxbridge, at half-minute intervals, fifty-nine starting out of an entry of seventy-one.

R. E. Guest (6 Matchless sc.)
J. Chater-Lea (8 Chater-Lea sc.)
Averies Ponette Co. (7 Ponette)

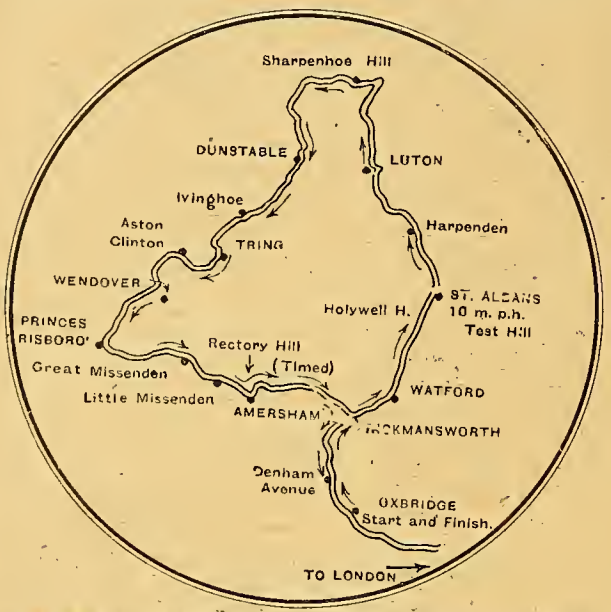
The roads from the start were very muddy, rather too wet to be treacherous, but the amount of surface water told its tale on the belt-driven machines.

Through Watford to St. Albans was a non-stop section, but competitors were early in trouble, E. A. Marshall (S.I.A.M.T.) and A. J. Sproston (Rudge) being passed by the roadside, whilst on Rickmansworth Hill G. S. Drew and D. J. Blackburn (6 h.p. Zenith sc.) came to a standstill. C. Aslin (2½ h.p. Grandex) had evidently forgotten to fill his petrol tank at the start, for he, too, stopped and had to push to the next village. At the foot of Holywell Hill, St. Albans, competitors were timed in by Mr. D. K. Hall, and then despatched singly up the 1 in 9 gradient at 10 m.p.h.

Groups of spectators had gathered to see the fun. How far competitors were successful will be seen by the summary of hill-climb results, but the best performance was by J. Oliphant (3½ h.p. Premier), whose machine with Armstrong gear toyed with the ascent. The next nearest to the set speed was W. Cooper (3½ h.p. Bradbury). The slowest ascent of all was made by E. A. Colliver (6 h.p. Zenith-Gradua), and though this rider gained nothing extra thereby, we mention the fact, as it is significant to note that he was successful in making the fastest time in his class on both the other test hills—a fine advertisement for the infinitely variable gear. The change-speed machines, of course, had little difficulty in keeping to 10 m.p.h. on Holywell, especially after being allowed to cool their engines at the hill foot. Of the others, W. F. Newsome (1912 free engine Triumph) and J. S. Holroyd (2½ h.p. Motosacoche) made slow but sure climbs, W. P. Tippett (3½ h.p. Brooklands) broke his belt, and G. L. Fletcher (2¾ h.p. Douglas) nearly came off as his engine stopped firing, due to the petrol tap having been turned off at the hill foot. He immediately grasped the reason, swung his machine half round, and the engine just picked up in time. In Luton crowds turned out to see the riders file through.

The Second Non-stop Section.

Again a non-stop section was arranged to Barton-in-the-Clay (which village did not belie its name). Here competitors were marshalled for the ascent of Sharpenhoe. There was no timing at this point, but observers were stationed. Several failed. Between Sharpenhoe and Dunstable competitors could dismount and do what they liked, and many took advantage of



W. F. Newsome (Triumph) and A. J. Dixon (Rudge) being started from Uxbridge. The first named won the cup in the trade section and gained most marks.

Herts. County A.C. Open Trial—

the opportunity, so that the results from a reliability point of view must not be taken too seriously.

The Dunstable control was missed by many, and as the Herts County A.C. makes its awards on the vexatious system of riding to a split second schedule, many of the competitors

The 100 miles' route followed by the Quarterly Trials Competitors last Saturday

had to dismount and ride back to find the official in charge. There was an abundance of unrolled stones scattered over the roads, and the single-trackers scored here, as they could pick their way. Not so the passenger machines, and several were hung up with tyre cuts and bursts. A stone cut clean through the sidecar tyre of Frank Smith's Clyno, of Porlock fame, and though it seems hard that a good machine should suffer on account of tyre trouble, Smith has had a good run of luck, and must not be too disappointed. Still, the burst might have happened a few miles further back, and then no marks would have been lost, although this is hardly as it should be. Through Aston Clinton to Tring brought the first stage of the run to a close. A capital lunch was served at the Rose and Crown Hotel, and in an hour competitors were on their way again.

Aston Hill-climb.

The first incident after lunch was a timed ascent of Aston Hill, where Messrs. F. Straight and F. T. Bidlake were stationed. The surface was drier here than anywhere. A. G. Fenn, whose twin Humber was running magnificently, made a fine climb. W. F. Newsome (Triumph) was fastest, beating Colliver by one-fifth of a second. F. W. Barnes (Zenith), with Weatherilt in his "cobweb" sidecar, opened the spectators' eyes as he sped up faster than some of the bicycles. D. J. Blackburn's machine could not have been running well, as he again failed.

The actual times of the class leaders on Aston Hill, near Tring, are given below for comparison:

	m.	s.
Class A.		
A. G. Fenn (2¾ Humber)	1	21⅖
H. Berwick (2¾ Humber)	1	25⅕
E. A. Marshall (S.I.A.M.T.)	1	39⅗
Class B.		
W. F. Newsome (3½ Triumph)	1	3⅕
C. C. Cooke (3½ Triumph)	1	5⅖
V. Taylor (3½ Rudge)	1	16⅘
Classes C and E.		
E. A. Colliver (6 Zenith)	1	3⅖
S. Witham (6 Matchless)	1	6⅕
Class D.		
F. W. Barnes (6 Zenith sidecar)	1	16⅗
R. E. Guest (6 Matchless sidecar)	1	23⅖
E. G. Attenborough (7-9 Indian sidecar) ...	1	47

Through Wendover, Ellesborough, and Kimble the going was particularly bad, narrow tortuous lanes providing the competitors with no end of exciting incidents. Troubles were plentiful. We passed C. C. Cooke (Triumph), R. Fletcher (Premier), and W. P. Tippett (Brooklands) effecting adjustments by the road side, whilst in Princes Risborough Oldman (Bat) suffered a puncture in the back tyre.

A comparatively unknown hill was encountered after passing the foot of Kop Hill, Princes Risborough, viz., Pink Hill. This ascent is not exceptionally steep, but there is a hairpin bend to the left which caused considerable trouble. Fortunately, the surface was comparatively dry.

Two meets of different kinds clash at the foot of Holywell Hill, St. Albans. It is a pity that competitors were allowed to cool their engines and alter gears for the hill-tests.

Herts. County A.C. Open Trial—

The competitors' performances on Pink Hill were really disappointing. There was quite a crop of failures on this ascent, which is somewhat similar to Harlow Bank, but not nearly so steep. W. Cooper and Newsome went up well; Holroyd pedalled slightly; G. L. Fletcher, Fenn, and Berwick, on lightweight twins, made as good ascents as the bigger machines; Barnes, in the passenger class, went up in his usual style. Among the failures were A. J. Dixon, T. E. Secar, H. Beal, E. J. Bailey, M. Drew, H. C. Matthews, W. Wilson, W. P. Tippett, G. S. Drew, E. Tee, C. F. Halsall, C. E. Holmes, D. J. Blackburn, and Averies' Ponette.

The route now lay through Missenden to Amersham, where the riders were once more marshalled for the ascent of Rectory Hill, but, owing to the fact that the timekeepers had not had time to catch up, a delay of fifteen minutes occurred. This, of course, allowed opportunities for engine cooling, which should not be permitted.

Too Complicated.

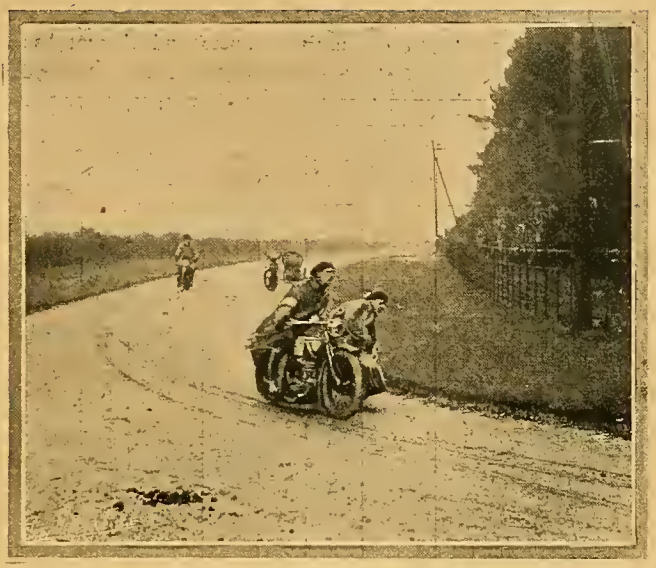
Before going further, we should explain that the general feeling was that the competition was far too complicated. There were too many controls and non-stop sections, and too much split second timing; few really understood where they could get off and make adjustments and where they could not. Why the unobserved sections were included at all it is difficult to understand. A reliability trial should be a non-stop run, or it is no useful guide to purchasers. Even of the score who have been credited with non-stops, we observed several fiddling with their machines, shortening belts, and altering gears, by the roadside.

On Rectory Hill, Messrs. F. T. Bidlake and D. K. Hall took the times. Again those who had done well in the previous hill tests shone conspicuously, Colliver on this occasion displacing Newsome for fastest time. The times of the class leaders on this hill were :

CLASS A.

	m.	s.	Marks.
A. G. Fenn (2¾ Humber)	1	8⅘	... 25
G. L. Fletcher (2¾ Douglas) ...	1	25⅘	... 8
H. Beal (3 N.S.U.)	1	29⅖	... 5

CLASS B.



W. F. Newsome (3½ Triumph) ...	0	52	... 25
V. Taylor (3½ Rudge)	0	54⅕	... 23
A. J. Dixon (3½ Rudge)	0	55	... 22

CLASSES C AND E.

E. A. Colliver (6 Zenith)	0	48	... 14
S. Witham (6 Matchless)	0	59⅕	... 0

W. L. T. Rhys (Zenith) endeavouring to make a repair to his sidecar frame

F. W. Barnes (6 h.p. Zenith sidecar) rounding the bend at the foot of Aston Hill, followed closely by W. H. Elce (3½ h.p. Rudge).

	m.	s.	Marks.
F. W. Barnes (6 Zenith sc.)	0	54	... 25
E. G. Attenborough (7-9 Indian sc.)	1	16⅕	... 3
C. R. Taylor (7-8 Chater-Lea sc.) ...	1	22	... 0

Vernon Taylor was baulked by a boy, and was allowed another ascent; this time he overtook another competitor in the middle of the road and lost valuable seconds in cutting in.

H. Berwick (twin Humber) suffered bad luck. He was travelling well, but something temporarily went wrong with his three-speed gear, for the engine roared round and gradually came to a standstill. H. A. Matthews (Zenith) started with his compression tap open, so that his time was slow.

Though the marking of the route was good on the whole, one or two doubtful places were unmarked and several went wrong in Amersham, missing Rickmansworth altogether.

Fifty of the fifty-nine starters were timed into Uxbridge, mostly in daylight, and in the evening the following were given as the non-stops :

A. R. Abbott (3½ Bradbury)
W. H. Elce (3½ Rudge)
J. Chater-Lea (Chater-Lea sc.)
E. G. Attenborough (7 Indian sc.)
C. W. Meredith (3½ Bradbury)
C. R. Taylor (Chater-Lea sc.)
H. Haddock (2½ A.J.S.)
S.A.M. Witham (6 Matchless)
Alan Hill (3½ Rudge)
G. T. Gray (3½ Rudge)
H. A. Cooper (3½ Bradbury)
G. L. Fletcher (2¾ Douglas)
M. Drew (3½ Zenith)
W. F. Newsome (3½ Triumph)
J. Oliphant (3½ Premier)
H. C. Mills (3½ Premier)
E. A. Colliver (6 Zenith)
J. S. Holroyd (Motosacoche)
A. G. Fenn (2¾ Humber)
F. W. Barnes (6 Zenith sc.)

Summary of results on Holywell, Aston, and Rectory Hills :

CLASS A.—Machines up to 343 c.c.

	Marks.
A. G. Fenn (2¾ Hnmber)	68
H. Berwick (2¾ Humber)	57
E. H. Marshall (2½ S.I.A.M.T.)	56

CLASS B.—Single-cylinders up to 600 c.c.

W. F. Newsome (3½ Triumph)	95
C. C. Cooke (3½ Triumph)	73
V. Taylor (3½ Rudge)	—

CLASS C.—Multi-cylinders up to 670 c.c.

E. A. Colliver (6 Zenith)	88
S. A. M. Witham (6 Matchless)	0

CLASS D.—Passenger machines.

F. W. Barnes (6 Zenith sc.)	97
R. E. Guest (6 Matchless sc.)	57
W. Oldman (5-6 Bat sc.)	50
F. Smith (5-6 Clyno sc.)	50

Herts. County A.C. Open Trial—

Results and Awards.

The performances of the medal winners and the marks awarded are given below:

Name and Machine.	On Hills. Holywell Hill. 10 m.p.h. 50	Aston 25	Rectory. 25	Aggregate. 100	Running to Schedule 50	Non-stop Section. 50	Total 200
CLASS A.							
GOLD MEDAL—							
A. G. Fenn (2¾ Humber)	18	25	25	68	49	50	167
SILVER MEDALS—							
G. L. Fletcher (2¾ Douglas)	47	—	8	55	47	50	152
H. Berwick (2¾ Humber)	45	12	—	57	50	45	152
CLASS B.							
GOLD MEDAL AND CUP—							
W. F. Newsome (3½ Triumph)	45	25	25	95	46	50	191
SILVER MEDAL—							
B. A. Hill (3½ Rudge)	50	1	16	67	49	50	166
BRONZE MEDALS—							
H. A. Cooper (3½ Bradbury)	38	1	14	53	49	50	152
R. G. Charlesworth (3½ Zenith)	50	—	8	58	49	45	152
CLASSES C AND E.							
GOLD MEDAL AND CUP—							
E. A. Colliver (6 Zenith)	50	23	25	98	41	45	184
CLASS D.							
GOLD MEDAL—							
F. W. Barnes (6 Zenith-s.c.)	47	25	25	97	43	50	190
SILVER MEDAL—							
C. R. Taylor (7 Chater-Lea-s.c.)	47	20	—	47	43	50	140
BRONZE MEDAL—							
E. G. Attenborough (7-9 Indian-s.c.)	36	—	3	39	46	50	135

The Judge's Report.

The trial may be said to have been made up of four distinct divisions as follows, in each of which a certain maximum number of marks were allotted, and penalties specified for any departure from the standard:

1. Running to schedule time, 50 marks maximum. There were three controls—at St. Albans, just before the slow hill-climb; at Tring, luncheon stop; and at Uxbridge, finish. A deduction of one mark per minute or part of a minute greater than ½ was made for any deviation from schedule time.

2. Certain portions of the route were set to be traversed non-stop. Any stops on these portions had to be reported, and were penalised. Maximum marks, 50 for non-stop run.

3. Slow hill-climb test. Holywell Hill, St. Albans, is said to have an average gradient of 1 in 11, maximum of 1 in 8. A 10 m.p.h. speed limit was imposed. The competitors were required to climb the hill at this or a lower speed, being timed over a measured length of 2,500 ft. A deduction was made of one mark for every three seconds or part of three seconds faster than schedule time. No marks were gained by going slower than 10 m.p.h. Maximum marks, 50.

4. There were two timed hill-climbs. The fastest rider in each class scored full marks; a deduction of one mark was made for every second in excess of the fastest time in the class. Maximum for each hill, 25 marks.

In the slow hill-climb at Holywell five riders failed to make clean ascents in their attempts to drive slowly. Twenty-five marks have been deducted for such failure, in addition to any marks that may have been lost for too fast speed. But no other deduction has been made in awarding the marks for non-stop.

In running to schedule, there being three distinct sections, the full marks—50—were equally divided over the three sections, so that a rider could not lose more than 17 marks for being late at any one control.

The regulations did not specify the penalty for a stop; I had taken it at five marks per stop. Fortunately, this penalty does not in any way affect the placing of the awards, as the recipients have all 50 marks for the non-stop sections.

The gold medals in Classes A, B, C or E, and D are won by A. G. Fenn, W. F. Newsome, E. A. Colliver, and F. W. Barnes respectively. These awards, together with those of the silver and bronze medals in the various classes, are set out in the table. In Class A, G. L. Fletcher and H. Berwick tie for second and third places; I would recommend that each be awarded a silver medal. In Class B, H. A. Cooper and R. G. Charlesworth tie for third and fourth places; I would recommend that each be awarded a bronze medal. The silver cup for the best performance by a trade rider is, on the scheme of marks set out in the regulations, won by W. F. Newsome, on a 3½ h.p. Triumph, with 191 marks out of a possible 200. The performance of F. W. Barnes, on a 6 h.p. Zenith and sidecar, with 190 marks, was practically as good; a very slight variation in the running or in the scheme of marks might have put him in first place. The silver cup for the best performance by a private owner is won by E. A. Colliver.

ARCHIBALD SHARP.

Petrol at Tring was supplied at 2s. a gallon or 3s. a can.

Many of the sidecarists had trouble, W. L. T. Rhys broke the saddle stay of his Canoelet but managed to reach Tring. At times we noticed his Zenith bicycle leaning inwards at a considerable angle, and we were truly alarmed when he rode anywhere near us, for he did not modify his pace to any extent.

B. Alan Hill had the exhaust pipe of his Rudge come adrift at St. Albans, and had to secure it by means of string.

Rather an extraordinary trouble befell G. Griffiths, the magneto of his Rover coming adrift; he afterwards secured it with copper wire.

At Amersham we met W. Pratt on a P. and M. sidecar. He had come out to see the fun on Rectory Hill, and was quite useful as a marshal.

The New Hudson Cycle Co. have generously offered a twenty guinea challenge cup to the Herts County A.C. to be awarded for the best aggregate performance in the four quarterly trials.

One of the competitors, A. J. Dixon, rode the last fifteen miles on his Rudge with a flat back tyre. Notwithstanding this, the Hutchinson cover seemed none the worse, although the tube was ruined.

S. A. M. Witham had a tight engine bearing which continually slowed him up and emitted a horrible screech. However, with plenty of oil he managed to finish.

V. Wilberforce stopped on Rectory because someone had turned off the petrol tap at the hill foot. Curiously enough, G. L. Fletcher, also on a Douglas, nearly stopped on Holywell for the same reason. Both riders are convinced that the taps were turned off by malicious persons.

Although making good performances on the timed hills, C. C. Cooke spoilt his day's performance owing to his carburetter piston slides sticking up with mud. Many of the competitors in the Exeter run fitted shields round their extra air intakes to guard against this trouble. With the same object, Fenn tied his pocket handkerchief on the petrol pipe, which happens to be arranged immediately in front of the extra air opening.

Great credit is due to the lightweights, many of whom managed to finish this arduous trial within schedule time. F. W. Applebee, sen., with his little 2 h.p. Centaur, and E. A. Marshall (2¼ h.p. S.I.A.M.T.) were amongst those to finish. The latter had tyre and belt troubles. J. Holroyd, that well-known competition rider got his 2¾ h.p. Motosacoche through without a stop—truly a marvellous performance considering the percentage of failures.

Before reaching Dunstable, G. Baxter noticed that his machine seemed to wag its tail in a most alarming manner. Dismounting, he found nothing wrong and the tyres hard, so he continued. He had got up to a speed of over 70 m.p.h., when he noticed the front wheel rocking from side to side, and at once applied the brakes. Before he could come to a standstill the front spindle broke in half, letting the wheel out of its patent catches. Fortunately, the rider was not much hurt, and eventually completed the course, finishing two hours late. The machine was an old one.

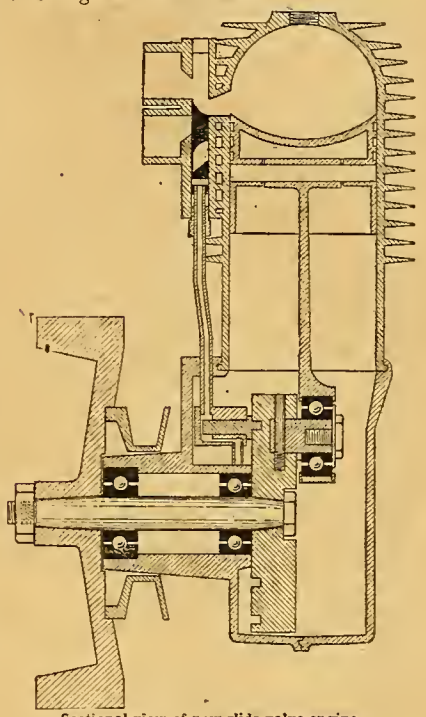
A SLIDE VALVE ENGINE WITHOUT GEAR WHEELS

THE Empire Foundry Co., 453, Holloway Road, N., have been experimenting with a novel type of slide valve engine, and have decided to put two models on the market for motor cycles—a 2¼ h.p. lightweight and a 3½ h.p.

No gear wheels are employed in this engine, but the single slide valve is operated by a slipper which slides in grooves cut in the face of the crank cheek.

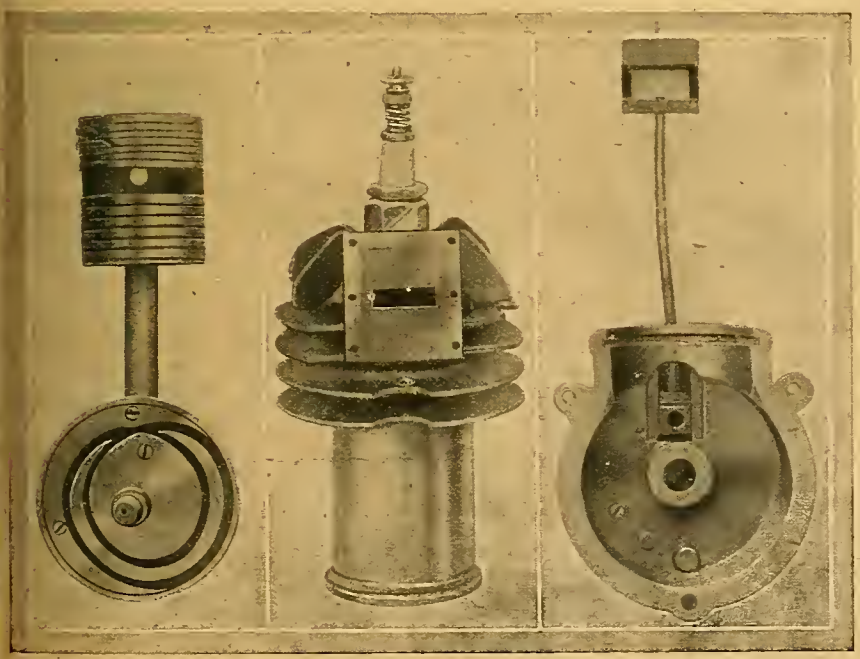
This method is by no means new, as it was employed by Gottlieb Daimler in 1889, and by the Motosacoche Co., but by modifying the shape of the grooves a quick lift and drop have now been obtained, which is said to greatly improve the efficiency.

The shape of the grooves can be plainly seen from the illustrations herewith. Full lift is obtained in one-fifth of a revolution. It will also be seen that for almost one revolution of the engine the slipper remains practically stationary, as the groove is concentric with the crank, but on the completion of this revolution the slipper is automatically moved across to the eccentric groove by the modification of the curve at this point. In this manner the 2 to 1 action is obtained.



A reference to the drawing will show that, when the valve is connecting the cylinder with the lower or exhaust passage, the only valve surfaces that are exposed to the rush of the hot exhaust gases are those which are not subjected to rubbing contact, and therefore do not matter. In such a slide valve as is employed in this engine, it is of importance to have good bearing surface all round toward the outer edges of the valve. The centre part, which is less important in this respect, is that part which is closing the cylinder opening when explosion takes place, and therefore is the only part exposed to the hot gases.

The drawing of the 3½ h.p. model also indicates a small plunger pump worked off the valve mechanism, and supplying oil through the hollow rod to the valve, and, if necessary, the cylinder surfaces. There is no reason why the same pump should not be ntilised for the main engine bearings.



A 1 h.p. Model and some Results.

This idea is not merely on paper, for the Empire Foundry Co. at their works have a small model, as illustrated, of a 1 h.p. running on the bench. Although it is dependent on air cooling, and no fan is used, this model engine appears able to run for hours at a time; and, even admitting that the proportion of cooling surfaces in such a small engine is large relative to the volume of burning gases, it certainly looks as if overheating would not trouble it in the least, and this may largely be explained by the quick cut-off, which enables the exhaust valve to be held fully open till a very late point in the exhaust stroke.

Obviously the design is one that lends itself to great lightness; in fact, the makers say they can produce the 2¼ h.p. engine for lightweights at a weight of about 15 lbs. Besides its positive action, the simplicity of construction in this engine is also a great recommendation, for it permits of an exceptionally accessible and easily dismountable design, while valve setting is not necessary when put together again. In fact, in this respect the veriest tyro cannot make a mistake. The reciprocating weight of the valve, too, is comparatively small, and this should conduce to a comparatively well balanced engine at high speeds. It may be added that the Empire Foundry Co. are open to negotiate with makers to manufacture this engine under licence.

Sectional view of new slide valve engine.

A NEW SLIDE VALVE ENGINE.

1.—Tramways actuating valve. in crank cheek
2.—Cylinder and valve port of 1 h.p. motor.
3.—Valve and push rod.

NEW MOTOR CYCLE COMPANY.

We understand that the late directors and managers of the Sabella Motor Car Co. are forming a company to manufacture quadcars with tandem and sociable seats. Although the bulk of the capital will be subscribed by the directors and their friends, the public will be given an opportunity to participate.

WAR OFFICE TEST at BROOKLANDS

The War Department of the War Office is holding a test of motor bicycles at Brooklands on Monday next, the 29th inst., at 11 a.m., presumably with a view either to purchase machines for the British Army or to gain data concerning the use of motor bicycles for military purposes. In the circular to manufacturers inviting them to send their riders with a motor cycle to the track, mention is made that "the War Department is now considering the question of the purchase of types of motor bicycles which might be suitable for use in the army."

Motor cycles which are submitted for this test will be required to climb the test hill from a standing start, in full touring trim, and with a rider weighing at least 12 st. Machines with engines up to 500 c.c. will also be required to average 45 m.p.h. on the track, and those with engines up to 350 c.c. 40 m.p.h. This will be a fairly stiff test for the average single-geared motor bicycle to accomplish It would therefore appear to be an opportunity for the variably geared machines to shine conspicuously.

Club News

Sussex M.C.C.

A meeting will be held this evening at eight o'clock at the Fountain Hotel, Worthing, to discuss the formation of the club and the amalgamation of smaller clubs and other matters.

Purley and District M.C.C.

The annual dinner and prize distribution on the 17th inst. was well attended. The evening concluded with a musical programme. The annual general meeting will take place on the 31st inst.

The Motor Cycling Club.

The gold and silver medals won in the recent London-Exeter and back trial will be presented at the opening run dinner, Old Ship Hotel, Brighton, on Saturday, March 23rd.

The following are the principal events for 1912:

March 23rd.—Opening run to Brighton, returning following day. Headquarters, Old Ship Hotel.
April 5th to 8th.—Easter tour and Jarrott Cup competition to Land's End and back.
April 27th.—Silencer trials.
May 11th.—Members' hill-climb.
May 24th to 27th.—London-Edinburgh trial.
June 15th.—Inter-team trial for *The Motor Cycle* Cup.
June 29th-30th.—All-night run and picnic.
July 6th.—Brooklands.
July 13th.—Speed-judging trials.
August 5th to 7th.—Devonshire tour, hill-climbs, and brake tests.
August 10th to 18th.—Continental tour.
September 7th.—Hill-climb.
September 28th.—Special club trial.
December 26th-27th.—London-Exeter and back.

In connection with the above events, there are nine valuable silver cups, one gold cup, and medals to be awarded.

Candidates for membership should apply to the hon. sec., Mr. W. E. S. May, 34, Gower Place, W.C. There are now over four hundred members in the club, and no more can be admitted after five hundred are registered.

SATURDAY'S QUARTERLY TRIAL.

C. E. Holmes (Chater-Lea sidecar) leaving the Rose and Crown Hotel, Tring, after the luncheon interval.

Nottingham and District M.C.C.

The annual general meeting will be held at the Welbeck Hotel, Nottingham, on Thursday, February 1st, at 8 p.m.

Birmingham M.C.C.

The ninth annual general meeting will be held at headquarters on February 17th. Ten new members were elected at the last committee meeting.

Grosvenor M.C.

A meeting will be held at headquarters, The Gorse Hill Hotel, Stratford, Manchester, to-day, 25th, at 8 p.m. Suggestions for 1912 season will be welcomed.

Sutton Coldfield A.C.

In a report recently issued by the Sutton Coldfield Automobile Club mention is made of the fact that no less than nine members have taken advantage of the free legal defence scheme in connection with summonses for alleged exceeding the speed limit. Out of the nine cases taken in hand, five were dismissed entirely and one dismissed on payment of costs.

Bedford and District M.C.C.

At a meeting held on Friday the 19th inst., it was decided to form a motor cycle club. The following officers were elected: Captain, Mr. A. F. Crump; vice-captain, Mr. C. F. M. Chambers; treasurer, Mr. W. H. Edwards; joint hon. secs., Mr. H. A. Lock, 9, Grafton Road, Bedford, and Mr. D. R. O'Donovan, Thornton Street, Kempston, Bedford, who will be glad to hear from intending members.

Essex M.C.

The club will hold its annual dinner and prize giving at the Great Eastern Hotel, on Saturday, February 10th. Mr. Stenson Cooke has kindly consented to occupy the chair, and a good musical programme has been arranged. The annual general meeting will be on Thursday, February 1st, at the Eagle Hotel, Snaresbrook, Essex, and it is hoped that all members will make every endeavour to be present.

Bristol M.C.C.

At a meeting held recently twelve new members were elected. On February 21st a lecture will be given by Mr. A. Bennett, of the Bosch Magneto Co.; all those interested are invited. The spring competition will be held on March 30th, and the summer competition on May 18th, while an open hill-climb has been arranged for April 20th. In addition to these, inter-club runs are being arranged with the Yeovil, Taunton, and Exeter clubs, and a continental tour in Holland will be held some time in August.

Surrey M.C.C.

The fifth annual general meeting was held at the headquarters on the 18th inst. The annual report was adopted unanimously, the number of members showing a large increase and the financial position being very satisfactory.

It was resolved to request Mr. Stanley Christopherson to continue as president. The following officers were elected for 1912: Chairman, Mr. E. Cox; vice-chairman, Mr. J. Sparks; captain, Mr. F. A. McNab; vice-captain, Mr. P. Mitchell; hon. treasurer, Mr. W. P. Trench; hon. secretary, Mr. C. J. Feeny.

A proposition by Mr. G. S. Williams, "That a section of the club be formed to study and develop scouting, despatch riding, and map reading, with a view to assistance in military operations," was discussed and approved, the new committee being instructed to bring the scheme into operation in good time for the coming season.

After the conclusion of the business of the meeting, a paper was read on the subject of the single speed *versus* the variable gear for motor cycles for solo use, by Mr. C. J. Feeny. A reply on behalf of the variable gear was made by Mr. E. Cox, and a very interesting discussion ensued.

Club News—

Manchester Amateur M.C.C.

A motor cycle club has been formed in the Manchester district, to be confined entirely to amateur riders. It is proposed to hold a hill-climb once a month during the riding season, and one or two reliability trials. Those desirous of becoming members of the club must be proposed and seconded by existing members of the club. All particulars may be obtained from Mr. R. B. Yeld, 30, Rathen Road, Withington, hon. secretary.

Hamilton and District M.C.C.

On Wednesday, the 10th inst., a large and enthusiastic meeting took place in Gibson's Café, Cadzow Bridge, Hamilton, when it was unanimously agreed to form a motor cycling club, upon a proposal put forward by Mr. Robert Cassells, Hamilton. The club commences with a membership approaching forty. The following officials were appointed: President, Mr. Robert Cassells, Hamilton; vice-president, Dr. Fotheringham, Motherwell; hon. treasurer, Mr. Wm. Rodger, Hamilton; hon. secretary, Mr. J. Low, Carmaben, Hamilton.

Blackpool and Fylde M.C.C.

Mr. Bennett's recent lecture was most instructive. About 110 slides were shown.

A reliability trial will be held next Saturday. The competitors will start at minute intervals from the Technical Schools, and are expected to ride at the rate of 20 m.p.h. The total distance is 116 miles.

Route and Condition of Road.—Main road Blackpool to Garstang; turn left, then right, road good, to Lancaster; turn right when through town, good; turn left at Hornby, good; turn right when one mile through Melling, be careful at corner, good; bad road from Melling to Ingleton; good from Ingleton to Long Preston; keep to right to Gisburn, road bad; be careful down Sawley Brow (gradient 1 in 4), road good; turn left at Clitheroe; turn right two miles past Whalley, road fair; turn right at Nellor; turn right at Five Barred Gate Hotel; be cautious; road fair to Preston; leave Preston by North Road, road good; turn left from main road when one and a half miles from Garstang, road good; when entering Blackpool, *via* Cemetery, turn left at Sanatorium; turn right Devonshire Square to last control. If possible, arrows showing road will be fixed.

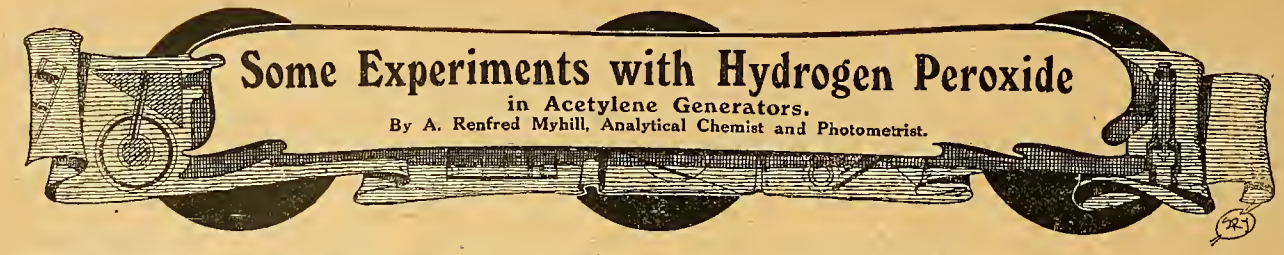
G. W. Orr (3½ h.p. Ariel), who has been awarded the silver cup as the "aggregate" prize in the Glasgow Motor Cycle Club's 1911 competitions. Mr. Orr gained a gold medal in each of the following events: Hill climb, reliability trial, consumption trial, and flexibility trial.

1912 ANTICIPATIONS. THE DUTCH TRIAL AND THE SAUCER TRACK.

A design by Miss E. E. Sewell which appeared on the programme of the North-West London M.C.C. smoking concert.

Purley and District M.C.C.

The annual general meeting will be held at the Greyhound Hotel, Croydon, at 8 p.m., on the 31st inst.



British Motor Cycle Racing Club.

At a committee meeting held last week it was reported that five members had resigned at the end of last year, and five new members had made application for election. The membership at present stands at over 120, which makes the B.M.C.R.C. one of the largest motor cycle clubs in the country. It is the only purely racing club in that branch of motoring. The annual report and balance sheet were passed, and nominations for the new committee were received; both these are in anticipation of the annual general meeting, which will be held at the offices of the Brooklands Automobile Racing Club, Carlton House, Regent Street, S.W., on Wednesday, January 31st, at 7 p.m. At the same meeting it was decided to recommend that the club's gold medal be presented to Mr. Alec S. Ross for his services as honorary auditor.

Inter-club Contest.

The joint winter reliability trial held for the Marians Challenge Cup between the Streatham and District M.C.C. and the Surrey M.C.C. will take place on Saturday, February 3rd, starting from the Swan Hotel, Leatherhead, at 8.30 a.m. Silver medals will be awarded to every competitor who completes the course in the prescribed time, and whose performance on the observed section is satisfactory. The teams will consist of six competitors, one of whom must drive a passenger machine. The winning team will be the one the members of which gain the highest number of awards, a silver medal counting as the equivalent of two bronze medals. In the case of a tie, the winning team will be the one the members of which, considered individually, have kept most nearly within the average riding speed over the observed section of eighteen miles an hour for motor cyclists and seventeen miles an hour for passenger machine drivers. The observed section will be between Newbury and Andover, which must be covered without a stop.

The route will be as follows: Leatherhead, Dorking, Coast Hill, Gomshall, Newlands Corner, Guildford, Hog's Back, Farnham, Warren Corner, Odiham, Warnborough, Hook, Basingstoke, Kingsclere, Newbury (check), Wash, Highclere, Dyley, Andover (check), Windwhistle Cottage, Wherwell, Crawley Down, Winchester (check and halt), Bramdean, East Tisted, Alton, Farnham, Hog's Back, Guildford, Gomshall, Dorking, Leatherhead—151 miles. Check at finish.

Some Experiments with Hydrogen Peroxide

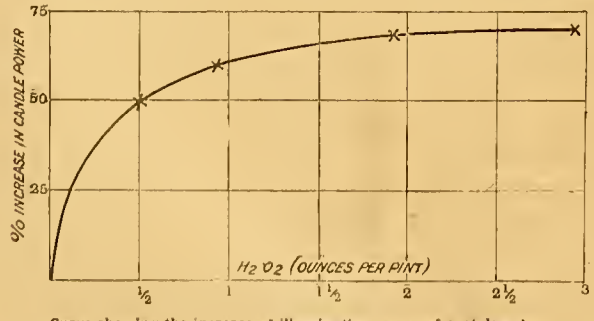
in Acetylene Generators.

By A. Renfred Myhill, Analytical Chemist and Photometrist.

THE following experiments were conducted with a view to investigating the truth or otherwise of the statements recently made in this journal that hydrogen peroxide, added in small quantities to the water used in acetylene generators, was beneficial to the light produced. The idea is, I believe, more prevalent in America than in this country, but no one seems to have made a thorough or conclusive test of it. The writer, therefore, was led to conduct a few experiments with the object of ascertaining—

(1.) The amount of increased light, if any, produced by the use of peroxide of hydrogen in the water.

(2.) The best strength solution to use.



(3.) The deleterious effect of its use on the metal parts of the lamp, or generator.

This last was suggested by a letter also appearing in *The Motor Cycle*, in which a correspondent suggested that hydrogen peroxide, being almost invariably acid, would exert a corrosive action upon the containing metal vessel.

The Presence of Acid.

Now the acid which exists in hydrogen peroxide is purposely put in in order to preserve it, and as the liquid is often used for analytical and medical purposes, it is evident that only a very small amount ought to be present. The writer obtained two samples, bought at random from two different shops, one sample being sold as "20 volumes strength," and the other as "10 volumes" strength. On analysis the first was found to contain about .1% of acid, while the latter contained .05% only.

When we consider that it is necessary to dilute the solution with about twenty times its volume of water before it is put into the lamp or generator, these figures become .005% and .0025% respectively, *i.e.*, the stronger contains only one part in twenty thousand of acid. Again, the acid which is used is nearly always phosphoric acid, or hydrofluosilicic acid, both of which exert practically no action on ordinary metals, even when strong. It is, therefore, evident that the action of the acid on the generator parts is so slight as to become absolutely negligible. In any case, it may be safely said that the carbide itself does more harm to the generator than any acid (which may or may not be present) in the hydrogen peroxide.

Curve showing the increase of illuminating power of acetylene by using H_2O_2.

The next experiment was to see if the light were increased by the use of this chemical, and, if so, what were the best proportions of it to use.

The statement, as we read it, of "putting two ounces of peroxide of hydrogen into a quart of water" is not definite enough for a practical guide, because the term peroxide of hydrogen may mean anything. Pure hydrogen peroxide is almost a chemical curiosity; what is sold as such in chemists' shops is always a solution of the substance in water, so that it is necessary to know exactly what strength we are buying in order to give any figures as to the proportions to use for making acetylene.

What to Buy.

There are two strengths commonly sold, known as "10 volumes" strength and "20 volumes" strength. A third is sometimes met with, but is rather expensive, and is rarely bought unless for delicate analytical work. This is Merck's 100 volume "Perhydrol," which contains about 30% of the pure substance. As the "20 volumes" is the strength usually sold, all the figures given below are based upon the use of the chemical of this strength.

A lamp in which acetylene was burned was tested photometrically, and its candle-power noted.

The same lamp was cleaned out, and hydrogen peroxide solution put into it in place of the water (the carbide being part of the same sample). Again the candle power was determined, and compared with the previous one.

This was done several times, each time using a solution of a different strength, so that the mixture giving the best result could be found.

The following figures were obtained:

Ounces of "20 volumes" hydrogen peroxide per pint of water.	Percentage increase on original candle-power of lamp.
½	50.0
1	62.5
2	68.8
3	71.0

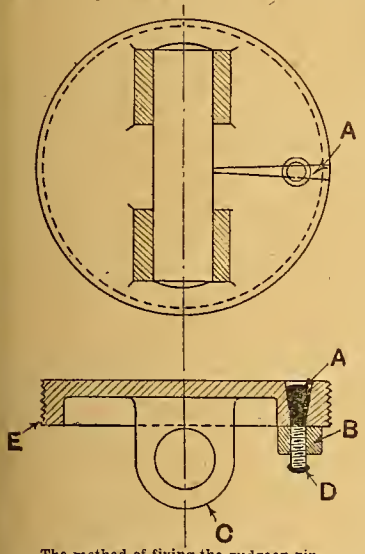
It will thus be seen that the addition of even a small quantity of hydrogen peroxide to the water effects a very marked increase in the candle-power of the lamp, while adding more of the chemical does not have anything like such a great effect as would be expected. This is best seen from the curve (reproduced), which shows the per cent. increase in candle-power, plotted against ounces per pint. This curve rises abruptly from zero to one ounce per pint, and then continues nearly horizontally, showing that the rate of increase of illuminating power becomes much less as more hydrogen peroxide is added. It may be here stated that the lamp was adjusted so that the best light was obtained in each case.

Some Experiments with Hydrogen Peroxide in Acetylene Generators

Possibly the explanation is as follows: The increase in candle-power is probably due to the oxygen which is evolved from the H_2O_2, together with the acetylene, causing more complete combustion than would otherwise be the case. It is well known that acetylene burns with a smoky flame unless supplied freely with oxygen, and that the more air (*i.e.*, oxygen) we give it, the greater the luminosity of the flame, up to a certain point. Beyond this point any excess of oxygen only tends to cool the flame and so decrease its brilliancy, so that with a great excess of hydrogen peroxide (and therefore of oxygen) this state of things is in operation.

It may, therefore, be taken as a rule that two ounces of "20 volumes" hydrogen peroxide per pint of pure (soft) water is the best for all-round work. I do *not* recommend the proceeding adopted by one amateur who filled his generator with H_2O_2 of full strength and then wondered why it exploded when he applied a light. A solution too strong would do far more harm than good, besides being risky, as acetylene and oxygen form a very explosive mixture.

With the strength given, however, there is absolutely no danger.



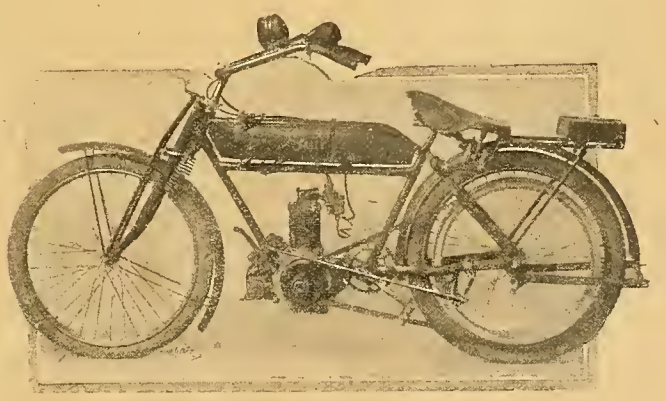
Just a word may not be out of place here as to keeping peroxide of hydrogen. The substance is not particularly stable, and should, therefore, be bought as required, as it readily gives off oxygen and loses its strength if kept for any time.

The bottle should be perfectly clean inside, as the least trace of dirt will often cause the substance to be quite useless in a few hours.

As accidents might take place if a mixture of incorrect strength were used readers who contemplate experimenting are advised to obtain the mixture only from fully qualified chemists.

THE EAGLE MOTOR CYCLE.

SEVERAL new models are being placed on the market by the Eagle Motor Co., 1, Shepherd's Bush Road, W. The accompanying illustration shows the first to be turned out—a 2 h.p. lightweight 60 × 70 mm. The engine possesses several new features. The inlet valve, which is mechanically operated, works on the overhead system, while two exhaust ports are fitted so as to allow free exit for the exhaust gases and to avoid distortion of the valve on one side. The combustion head on this model is detachable. The most interesting feature in this and the other types of engines made by this firm is the patent gudgeon pin fixing, which is illustrated herewith. A brass disc on which the gudgeon pin bearings are cast is screwed into the piston, tight up against the underside of the top of the piston. (A mica washer is placed on the top of the disc to act as an insulator. The disc is split, and near the outer end of the split a threaded taper pin is inserted. After the disc has been screwed home the pin is locked by means of a nut, the end being burred over to prevent the nut unscrewing. The taper pin expands the disc and renders it a rigid fixing in the piston. The gudgeon pin is a tight driving fit in the small end of the connecting rod, and the rod is, of course, threaded on the gudgeon pin before the disc is screwed into the piston. For this method it is claimed that the fixing is absolutely safe and the gudgeon pin has a larger bearing surface.



The method of fixing the gudgeon pin.
A. Taper pin fitting into split portion.
B. Nut.
C. Gudgeon pin bearing.
D. End of screw, burred over to prevent nut coming off.
E. Thread for screwing into piston.

Both sides of the crankshaft run on ball bearings. In the large models a special oil sump is provided in the bottom of the crank case, which allows the oil to be kept at a reasonably cool temperature. The magneto is carried in an aluminium case, and is driven by means of an enclosed chain. The frame has the top tube dropped at the rear, while Druid forks, front and belt rim brakes, and footrests are provided. The lubrication is by crank case suction through an adjustable drip feed and an auxiliary hand pump. Brown and Barlow carburetters are fitted to all models.

Other types which will shortly be ready are a 3½ h.p. tourist single-cylinder 85 × 88 mm., a T.T. model with an engine of similar dimensions, a 4 h.p. twin 60 × 60 mm., and an 8 h.p. twin 85 × 88 mm., which may be had with either belt or chain drive.

Other specialities are a ladies' 2 h.p. single with slightly inclined engine and a 4 h.p. ladies' twin. To these a stand will be fitted which will allow the rider to remain at rest in traffic without the need of putting the feet to the ground. Another item which will be supplied to fit these models is a special quickly detachable sidecar, the frame of which is suspended on semi-elliptical springs. All models may be had with change-speed gears and foot starting.

It is interesting to note that the Eagle Motor Co. specialise in all repairs to motor cycles.

Belt side of the 2 h.p. lightweight Eagle.

The Editor does not hold himself responsible for the opinions of his correspondents.

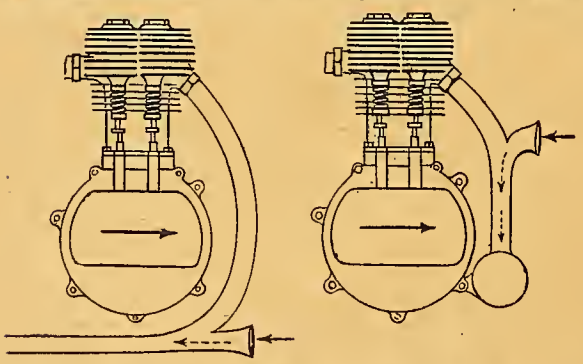
All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Tyre Repair Hints and Other Items.

Sir,—The following might be of interest to some of your readers :

After applying "no-cement" patches to inner tubes light the head lamp and hold the patch side down on top of the lamp until it becomes too hot for the hand, when, of course, it should be removed; this will quite effectually vulcanise.

If the size of the rent will permit, a patch should be placed on the inside of the tube as well as on the outside.



One half-ounce of sulphuric ether to each gallon of petrol will give a quick igniting fuel for winter use that will give more power than ordinary petrol.

I see that Mr. B. H. Davies in your issue of November 30th mentions the "'open muffler boob' (as the Yankees term him)." Now, as a matter of fact, the term is confined to the use of the paper which originated it and a few of its subscribers. The paper in question is the one you commented on in "Current Chat," of December 21st, which remarks I fully endorse. FRANCIS C. TURNER.

Virginia, U.S.A.

Cooling the Exhaust Gases.

Sir,—Perhaps your readers may find the enclosed idea interesting. Cooling the exhaust quietens it, I believe;

also in this case there would be no back pressure—in fact, just the reverse. It could be modified in appearance.

L. C. BAIN.

[The exhaust gas might be cooled in the manner suggested where the air enters at the base of a long pipe, but in the case of the orifice high up near the engine, any reduction of noise due to the cooling effect would be counteracted by the escape of the gases so close to the valve. The result would, we think, be the same with the longer pipe, but to a modified degree.—ED.]

The Motor Cycle and Theatricals.

Sir,—Thanks to an article in *The Motor Cycle* we had the pleasure of meeting the members of the George Edwardes M.C.C. during the visit of the Merry Widow Co. to Cork. Unfortunately, the visitors had not brought their machines to Ireland, as they had heard such a bad report of our roads, especially in winter.

Mr. C. G. Goode, the founder of the C. and D. M.C.C., had invited the members of the local club to a smoking concert on Wednesday, January 3rd, and he immediately extended a cordial welcome to all the members of the George Edwardes Club. Messrs. Warren, Foster, Sinclair, Cotter, and Ripley Evans were present, and a most enjoyable evening was spent.

Messrs. Dobbin and Pohlmann also took Messrs. Foster and Cotter for a run in their sidecars to Macroom, Messrs. Egan and Russell accompanying them on solo machines, and in spite of the bad state of some of the roads the run was thoroughly enjoyed by all.

We hope to have a return visit from this little band of genuine enthusiasts before long, when we intend organising an inter-club competition of some kind.

RONALD S. RUSSELL,
Hon. Sec. Cork and District M.C.C.

The Nominal Horse-power of Motor Cycles.

Sir,—Regarding horse-power rating, I often see in *The Motor Cycle* and other papers that the same-sized moter is called 3, 3½, and 4 h.p. Personally, I should prefer that all makers mention in their price list the exact cubical capacity of their engines. Now, I have found that by dividing the c.c. by 100 you have nearly exactly the actual horse-power of the motor. Examples :

F.N. four-cylinder motor, 494 c.c. = 4.9 h.p.
Matchless twin, 76 × 85 mm. = 776 c.c. = 7¾ h.p.
Triumph, 85 × 88 mm. = 499 cc. = 5 h.p.

Do you approve of my method? I hope to hear from you about the matter through the columns of *The Motor Cycle*.

Amsterdam. A. CITROEN.

[Mr. Citroen's suggestion is an excellent one. We should explain that his communication reached us before the article on the same subject (page 63) appeared in print, though not before it was written. "Auriga" pointed out in the article that motor cycle engines are capable of giving 1 h.p. per 100 cubic centimetres capacity, and Mr. Citroen's suggestion is to rate the horse-power of motor cycles in this manner. It is worthy of careful consideration by all motor cycle manufacturers, as the method in use at present is somewhat misleading.—ED.]

How to Prevent Side-slip.

Sir,—I notice on page 58 of last issue, that "Ixion" gives my letter, published under above heading on January 4th, a direct negative. I can only say that I wrote my letter immediately after a ride when I had actually proved the advantages I described. I should be very pleased to take "Ixion" out on the carrier and prove it to him or on him at any time when the roads are suitably slimy.

GUY WROWE.

Sir,—It is with some hesitation that I presume to criticise your contributor "Ixion," but I should like to explain my views on his suggested additions to the article on side-slip. On the subject of the advisability of wide handle-bars I quite agree with him. His advice as to not funking is good, but very much easier to give than to take, especially if one is traversing a nasty patch of grease which has been the cause of one's downfall on a previous occasion; but my experience in regard to weight on the carrier is the exact opposite to his. I find, for instance, that a passenger on my carrier (though I do not recommend this form of transport) distinctly minimises skidding, and does not seem to have the same effect as placing the saddle further back. I have always imagined that the reason for this was that the extra weight caused the rear tyre to go right through the mud and bite on the road surface proper. Of course, if more weight is carried over the rear wheel, the tyre must be pumped harder. UBIQUE.

This Year's Tourist Trophy Race.

Sir,—The Competitions Sub-committee of the Auto Cycle Union has instructed me to write to you regarding a letter which appeared in your last issue signed by a Mr. G. J. A. Brown. The correspondence with the Isle of Man authorities having been laid before this committee, it is satisfied that the statements of Mr. Brown are not in accordance with the facts. As the negotiations between the Isle of Man authorities and the A.C.U. are still in progress, I cannot make any further statement at the moment.

With regard to his statements as to the conduct of certain motor cyclists, Mr. Brown must have forgotten that the A.C.U., both in the Isle of Man and since, took drastic action with the offenders.

F. STRAIGHT,
Secretary A.C.U.

Sir,—I have noted with surprise that you suggest France as a favourable place for holding the T.T. Races.

On account of the hilarity on the part of certain competitors you are flying from the Isle of Man, where the authorities, to put it vulgarly, have already had enough of them, although the temptations for the young and loose could never have been very great.

You have chosen France! France, sir, was never a country calculated to reduce the feelings of the hilarious; and the Frenchman is the very last person in the world to forgive that vice on the part of a foreigner. He resents it to a very marked degree, and, to put it mildly, he will not stand it.

It has long been the belief of the misguided many that the Frenchman loves the Englishman, that he esteems him, and that his one wish is to be seen with him. I have spent a considerable time in France, and have studied the Frenchman's character with the utmost care, and can assure you, sir, that the above assertion is entirely without foundation, and that no statement could be more entirely false.

The average tourist, who spends a few weeks in every country in Europe, has read that the above was the case—he believes it, and troubles his head no more about it, for the Frenchman is too well-bred to show him in any way whatever that he is mistaken. I only wish the Englishman was equally well-bred!

No! You can rest assured, Mr. Editor, that unless we can rid ourselves of the hilarious few (which, I fear, is impossible), the projected step will be a dangerous one, and will weaken the *entente cordiale* (which, by the way, is already tottering to its fall) rather than strengthen it.

H. A. BUSK.

THE CLYNO AS A THREE-SEATER.

A. Brintman, of Paddington, W., who uses a two-seated sidecar of his own design with his 5-6 h.p. two-speed Clyno. In a letter to us, the owner remarks upon the comfort of the machine.

Winter Runs.

Sir,—To us Northerners the various picturesque accounts of the big winter trials held "down South" are most interesting, but how every writer enlarges on the "oceans of mud" that were everywhere, especially on the riders!

In view of the various articles and letters that have appeared recommending the ordinary two-wheeled motor cycle for professional and business uses *in all weathers*, it rather looks as if the writers have not had the experience of riding under such conditions as these trials were held.

Being an ardent advocate of three or more wheels for all-weather business travelling, it would greatly interest me, and no doubt many others, to hear from observers how the A.C. and the Morgan runabouts fared in the Exeter run. Were the riders of these machines able to keep clean and comfortable without the addition of the weird and wonderful, and, in most cases, useless, mudguarding devices that disfigured the motor bicycles? With regard to the Morgans, were these the two-seater models driven without passenger? If so, what was their behaviour when taking a sharp turn to the left?

Wishing *The Motor Cycle* in 1912 the same well-merited success it has enjoyed in past years,

CECIL KIMBER.

[The remarks in this journal with regard to the way most of the riders were bespattered with mud, apply more particularly to the bicyclists. The Morgan runabouts, with one exception, carried passengers.—ED.]

Clean Counties and Local Taxation Licences.

Sir,—In your issue of the 11th inst., page 49, "Rutlandshire" notifies an endorsement printed in red at the top of his 1912 motor licence form. My own form (Middlesex) is similarly endorsed, but I should like to point out another alteration. Formerly, under the heading "Exemptions," the form stated that no tax need be paid "for carriages or *motors* kept but not used at any time within the year." Now the word "motors" is omitted, and the clause reads, "for carriages laid by but not used at any time within the year." This looks as if the tax gatherers wish to try and squeeze more money from the motorist by charging for motor bicycles kept but not used. Is this legal? The unwary may take it to be so and pay extra.

NON-DOCILE.

[Motor cycles and cars kept but not used at any time within the year are exempt. The term "carriage" means any carriage drawn by a horse, etc., or propelled upon a road.—ED.]

Sir,—Enclosed is some correspondence regarding an application to Ayrshire for registration of a motor cycle. I trust it will be of interest.

MOTOSACOCHE.

County Buildings, Ayr.
January 16th, 1912.

MOTOR CAR ACTS.

Dear Sir,—I am in receipt of your application for the registration of a motor cycle and postal order for 5s. in payment of the fee.

However, since you are residing at Streatham, application should be made to the County Clerk, Spring Gardens, S.W. I return the postal order and form which you sent.

Yours faithfully,
(Signed) ———.
Streatham, S.W.,
January 18th, 1912.

The County Clerk,
County Buildings, Ayr.

Dear Sir,—I am again sending you herewith the form for registration of motor cycle and P.O. for 5s. which you have returned to me with the erroneous remark that these "should be sent to the County Clerk, London, S.W."

Please note that I do *not* intend giving any of my licences to London.

To enlighten you I would mention that London alone had no less than twenty-three police traps in 1910, which number increased to 175 during 1911.

For your future guidance please note that the law allows all licences, whether for dog, guns, game, men servants, motors etc., (with but *one* exception, "driving licence"), to be paid into *any county or county borough in the kingdom.*

Please therefore send me a registration number for my motor cycle with as little delay as possible.

(Signed) ———.

The Stream-line Body on Racing Motor Cycles.

Sir,—The illustrations on pages 56-57 of last week's issue of *The Motor Cycle* greatly interest me, as I think there is more in the idea than one would think from casual observance. I can remember having great talks with W. E. Cook when he was at the height of his racing fame, on the subject of wind cutting bodies and *disc wheels*, which, I think, are very important. He said he thought they would certainly increase speed, but that side gusts so peculiar to Brooklands, especially just after going under the members' bridge, would have a tendency to blow one out of one's track or course. I shall certainly try the idea myself this year. I am certain that it will increase existing speed records.

HARRY BASHALL.

Multi-pole Sparking Plugs.

Sir,—Perhaps my experience will prove interesting to those of your readers who hesitate to fit the Lodge double-pole plug in conjunction with magneto ignition. I have used this excellent fitting with both Bosch and Simms magnetos and neither has suffered in the least. To overcome the difficulty which some appear to have experienced in regard to ease of starting, it is a very simple matter to fit an arrangement for shorting the ordinary plug for starting purposes, to be out of action when the rider is comfortably seated. This arrangement has the advantage of showing the difference in running, *whilst running*, between the two-spark and single-spark systems. I have not experienced any difficulty in regard to starting, provided the points of *both plugs* are set as closely as possible without actually touching. The best positions for the plugs are, one over the inlet valve and the other in the combustion chamber, not both in the valve chamber. As complete combustion takes place in approximately half the time with the two sparks, the ignition must not be quite so much advanced as when only a single pole plug is used. W. J. LANCASTER.

A High Speed Passenger Trial.

Sir,—"Ixion" in his note on a high-speed passenger reliability trial appears to suggest as his impression that the future of designs in the "sociable" line is not bright. I cannot agree with this sentiment. After an experience of motor cycling which must be nearly as long as his own, I am slowly being forced to the conclusion that motor cycles of the two-wheeled pattern must always be handicapped by a drawback that it seems impossible to eliminate. They do not give the rider sufficient protection from dust or dirt. The serious all-weather rider must be prepared to find himself not infrequently at the end of a long journey in a state of filth more or less abhorrent to most. To the great and increasing army of motor cyclists who are doctors, commercial travellers, or other men of business, this is a matter of vital importance. To the better class of motor cyclists who can afford an increase in first cost of £20-£30 a vehicle which will give extra comfort and protection must always be interesting and acceptable if it is as speedy as the present motor cycle.

"Ixion" raises the objection to a T.T. race that designs are not sufficiently stereotyped. Unless he belongs to that school who believe only in stock-type races, he should be with me when I say that races are intended to lead to a standardisation in design. I cannot remember that in the early days of Continental racing the organisers waited for any stereotyping process. Steam cars, petrol cars, bicycle, tricycle, all raced together. Why a handicap? We ask designers to produce a vehicle to replace the average high-power sidecar outfit. The cardinal points are, therefore, well-known and agreed upon:

1. Price must not be more than £90.
2. Weight must not be more than 3 cwt.
3. Vehicle must carry passengers side by side. Let us throw these at the designers to worry out in the way each thinks best. The race will decide.

His suggested Brooklands trial would undoubtedly be a very fine thing as a preliminary blending, but nothing could equal the T.T. race as a test of questions in stability and other details which are as yet undecided. If the sociables were allowed to race with the junior machines no one would be inconvenienced, for the first year or two at any rate, as presumably the number of entrants who could go to the expense would be small. It would, no doubt, be increased if a preliminary Brooklands trial were held. H.M.

Sir,—In view of the forthcoming T.T. races, I should like to back up the suggestion which has already appeared in your paper, namely, the inclusion of a sidecar race in the T.T. programme.

Sidecars are now so popular that a race of this description would be extremely useful, as it would tend to produce strong yet light sidecar axles and connections. It would also afford a thorough test for variable gears.

I should like to hear the opinions of others on this matter.

JUNIUS.

Hill-climbing.

Sir,—Apparently "Fair Play" has more confidence in his judgment of what is possible for a motor to climb than he has of your last week's correspondent's veracity.

I hope that in the near future this confidence may be shaken and that the Clyno may be the cause.

In reply to Mr. F. Smith I do not live in the Lake District, but am often there, and should be writing this letter from there but for the heavy snowfalls.

The early spring is the best time to climb Honister, as later it is much cut up by traffic.

I should be delighted to occupy the Clyno's sidecar and be able to verify its success. H. NEWMAN.

Are Provincial Shows Wanted?

Sir,—At the present time manufacturers would be doing service to themselves and the trade generally by waiving, for one year at any rate, any rigid rule they may have as to restricting their exhibiting to one show per annum.

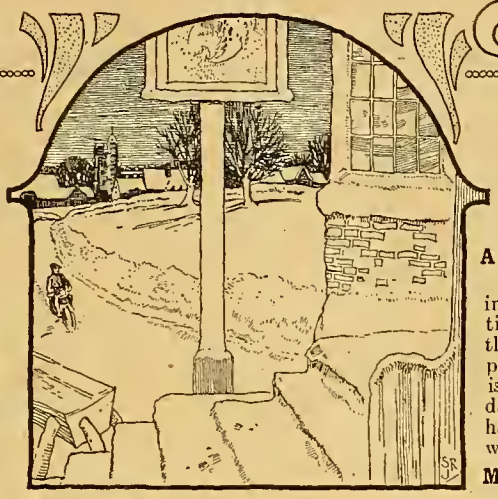
The present time is one of unusual interest and enthusiasm on the part of the general public towards motor cycling. The trade will miss valuable advertising and commercial advantages by not holding a special show in the North of England in addition to the one already held in London.

The rule restricting exhibitions to one per anoum may be a useful one, so long as its operation works only towards preventing reckless expenditure, but the rule becomes a mischievous one when it prevents expenditure that will be profitable for all—profitable for the manufacturers, for the retailers, and for the public.

There are thousands of motor cyclists in the North to whom the inconvenience of a journey to London has been a bar, furthermore, beyond these existing enthusiasts, there is an even larger number of the non-riding public with sufficient interest in the pastime to tempt them to look round an exhibition if sufficiently near to them, but who would not journey specially from the North to Olympia.

The effect of a local exhibition upon the minds of these waverers would bring sufficient reward to the trade for any expense and trouble.

THE COLMORE MOTOR CYCLE DEPOT.



Silence and Silencers.

Sir,—As the initials used by your correspondent on the above subject in the last issue are the same as my own, I feel compelled to enter into the discussion to prevent misapprehension amongst my numerous motor cycling friends.

It can be admitted that a very small number of motor cyclists do ride with open exhausts, but to condemn the whole from this is very unfair; then again to state there is no improvement in silencers since 1907 is too sweeping. There are so many motor cycles that are efficiently silenced and without undue back pressure, it would need a large amount of space to detail them, but I will mention my 1912 Rex de Luxe, which with its long exhaust pipe is reasonably silent, but to show that manufacturers are dealing with this problem seriously, I may say that the manager of the Rex Co. informs me that they are experimenting with an exhaust box to fit on the end of the long pipe, and this will, in my opinion, eliminate all noise from the exhaust.

The suggested new law on cut-outs will probably mean another way in which the police can show their "regard" for the motorist, or should I say the motorist's pocket—one more addition to the many burdens of the motorists, if it is to be dealt with by the police in a like manner to such technical offences as exceeding the speed limit, non-production of licence, etc. A. H. PRIESTLEY.

CURRENT CHAT

TIME TO LIGHT LAMPS.

Jannary 25	...	...	5.32 p.m.
,, 27	...	...	5.36 ,,

,, 31	...	...	5.43 ,,

"The Motor Cycle" Spring Number.

Although the weather at the time of writing is not of a spring-like nature, we hope for improved riding conditions by March 21st, when the Spring Number of this journal will be published. Particulars of the contents will be announced at a later date.

Lecture at Leeds.

Mr. V. A. Holroyd gave a lecture on motor cycles before the members of the Leeds M.C.C. on Friday last. The lecturer, who was well received, illustrated his remarks by lantern slides, some of which were reproductions of photographs which have appeared in these pages.

Winter Trial in Derbyshire.

The Derby and District M.C.C. winter trial for the Russell Challenge Cup was run on Saturday last. Seventeen entries were received, but, in face of the appalling road conditions caused by the blizzard, none except the boldest spirits came to the start. The course was a circular one of twenty-five and a half miles, to be covered three times, and the speed fixed was eighteen miles per hour. G. Brough (6 Brough) proved an easy winner, E. Russell (3½ Russell) being second.

A Hill-climb in Ceylon.

A most interesting event took place on Saturday, December 23rd, 1911, when the Ceylon M.C.C. held a hill-climbing competition on the Kadugannawa Pass. Steep gradients of any length are difficult to find in Ceylon, and this hill was chosen on account of its curves. A feature of the competition was the splendid riding of T. F. Lucas (T.T. Triumph). Both he and R. Forrest (Triumph) took the corners particularly well. Results:

Class A (lightweights).—T. B. Stewart (w.o.)

Class B (under 520 c.c.)—1, T. F. Lucas (T.T. Triumph); 2, R. Forrest (Triumph); 3, E. Brown (Triumph).

Class C (single-geared machines only).—1, Lucas (T.T. Triumph); 2, Brown (Triumph); 3, Forrest (Triumph).

Class D (under 800 c.c.)—1, Lucas (T.T. Triumph); 2, Joliffe (6 Bat); 3, Gardner (Triumph).

Class E (under 1,000 c.c.)—1, Lucas (T.T. Triumph) and Northway (6 Bat); 3, Joliffe (6 Bat); 4, Forrest and Gardner (Triumph).

Only two entered for the race open to all comers, D. J. Maitland (twin Bat) and Lucas (T.T. Triumph). This was a close race, until Lucas got into a rut and fell.

The last race, for slowest time, was won by A. T. G. Gardner (5 F.N.), Traves (P. and M.) being second, and Joliffe (6 Bat) third.

French Easter Trial.

The A.C.C.F. two days' trial, April 7th and 8th, at Easter comprises a circular course near Paris, and is called the Circuit de Paris. The stopping place for the night is Compiègne. The total distance of the two days' runs is 337 miles.

Gradient of Stoney Brow.

It has been pointed out to us that Stoney Brow, Manchester, recently climbed by H. Reed on a Dot sidecar with three passengers, is steeper than 1 in 7, and is really 1 in 4. Our local correspondent interviewed the city surveyor of Manchester on the subject, and he confirms our statement, but the authorities will now have the hill surveyed again.

French Riders and Variable Gears.

Inspired by the performances of British machines in last year's Circuit du Rhone, the Lyons M.C.C. will, we believe, for the first time in France, award special prizes and organise separate classes for motor bicycles with change speed gears and clutches in its International Touring Trial on April 28th.

SPECIAL FEATURES.

QUARTERLY RELIABILITY TRIAL (Illustrated).

ENGINE POSITION.

EXPERIMENTS WITH HYDROGEN PEROXIDE.

A Warning.

We understand that the "Test Hill" in Richmond Park will be under observation in future on Sundays, and that as the hill is not long enough for trapping purposes, summonses will probably be issued for "riding to the common danger." Motor cyclists who are in the habit of trying machines on the hill are warned not to travel too fast.

Military Motor Cyclists.

There are three vacancies in the East Lancashire Royal Engineer Telegraph Company, whose headquarters are at Seymour Grove, Old Trafford, Manchester. An allowance of £6 10s. per annum is made for the maintenance of a motor cycle during camp. Further particulars may be obtained from headquarters or from Mr. G. A. Moore, M.I.H., 10, Crofton Street, Whitworth Park, Manchester.

Exeter to Penzance and Back.

Members of the Exeter and District M.C.C. took part in a winter reliability trial to Penzance and back—a distance of 230 odd miles—on Saturday last. The Okehampton road was in a very bad state, but the surface improved as Cornwall was approached. There were many retirements owing to various causes. Finally, Exeter was reached to the schedule of 20 m.p.h. by two competitors, J. A. Neumann and S. J. Saunders, who both rode 3½ T.T. Rudges, and, subject to confirmation, tied for first place. Mr. Neumann, who also won a gold medal in the London-Exeter run, considers the trial was much more severe than the M.C.C. event, owing to the state of the roads and the higher schedule speed.

DERBY AND DISTRICT M.C.C. WINTER RUN.

Competitors near Cross o' th' Hands, Wirksworth, where the banks of snow were seven or eight feet high. Geo. Brough, the winner, is the third rider from the left.

The Tourist Trophy Fund.

We have received a cheque for £5 from Mr. C. H. Hitchen, of Morecambe, as a contribution towards the Tourist Trophy Fund The amount has been forwarded to the Secretary of the Auto Cycle Union.

Irish Riders and the T.T. Race.

Irish riders will be disappointed if the T.T. race be held in France this year The Isle of Man is so conveniently accessible from Ireland that, so far as the Emerald Isle is concerned, Manxland is the better venue.

Yorkshire Road Improvements.

The Stockton Rural Council, who have in recent years done a very great deal in the direction of improving sharp turns and dangerous corners in their area, are still proceeding with this work, and have just completed a splendid improvement at Hartburn, where there were two exceedingly dangerous turns. A new road has been constructed round the back of the village, making an almost straight road past the village on the road from Stockton to Darlington. Two other corners are to be rounded off, Mr. R. T. Hett, on behalf of the owners of the Norton Estate, having given a piece of land on the road between Norton Hardwick and Carlton Junction Railway bridge, and the Stockton Grange Estate Co. having made a similar gift of a piece of land at the first pay gate on the Durham road for this purpose. The latter is a very important and much needed improvement, as a motor cyclist was killed there about a year ago through a collision with a car at the corner, which prevented the drivers from seeing each other till too late.

Circuit du Rhone, 1912.

The Lyons Motor Cycle Club has formulated an ambitious programme for this year. Among the events of interest to British riders are April 28th International Touring Trial, July or August Circuit du Rhone. The latter was won last year by a British rider on a British machine when the North-West London M.C.C. members went touring to the South of France.

FUTURE EVENTS

Feb. 17.—Sutton Coldfield A.C. Open One Day Trial.
Mar. 2.—A.C.U. Open One Day Trial.
" 23.—B.M.C.R.C. Race Meeting.
" 23—Herts. County A.C. Open Quarterly Trial.
" 30.—Derby and District M.C.C. Open Hill-climb.
Apl. 5-8.—N.W. London and Herts. County M.C.C. Joint Trial and Open Hill-climb (Yorks.) and Ladies' Competition.
" 8.—Westmorland M.C.C. Open Hill-climb on Brigsteer Brow
" 13.—Oxford M.C.C. Open Hill-climb

The Motor Cycle in India.

From an authoritative source we learn that the motor cycle was very much in evidence at the Delhi Durbar. The use of motor cycles in India has been fairly popular, dating from the early days of the pastime, a sufficient proof of this being provided by the descriptions and illustrations of tours and rides undertaken in that country which have appeared in these pages.

FIRST QUARTERLY TRIAL OF 1912, ORGANISED BY THE HERTS. COUNTY A.C. (MOTOR CYCLE SECTION).

Competitors passing through Rickmansworth. Note the rain-soddened road surface.

Auto Cycle Union Notes.

THE SIX DAYS' TRIALS.—Mr. Potter, secretary of the Taunton M.C.C., and Mr. Goldsworthy Crump, the Taunton district surveyor, recently attended a meeting of the A.C.U. Competitions Committee, and offered some valuable suggestions regarding the route and the general arrangements of the trial. Mr. Goldsworthy Crump's knowledge of the roads is of the greatest value. He is a keen motor cyclist of many years' standing. Mr. Potter offered to procure a cup to be awarded for the slowest clean ascent of Porlock on a motor bicycle.

STARTING AT RACES AND HILL-CLIMBS.—An affiliated club recently asked the Competitions Committee of the Auto Cycle Union for its ruling as to whether or not motor bicycles fitted with free engine clutches or two-speed gears might be brought to the starting line at a hill-climb with the engines running. The A.C.U. desires it to be known that it is wholly in agreement with this procedure.

THE QUADCAR QUESTION.—A letter was sent recently by the Auto Cycle Union to the R.A.C., pointing out to that body that the new type of vehicle recently evolved, which is generally known as a quadcar, legally came under the motor car category, and that, presuming it were desirable that the development of this vehicle should be encouraged, whether the R.A.C. would consider the running of trials and competitions with this object. A reply has been received to the effect that the R.A.C. was of the opinion that its Technical Committee and the A.C.U. Competitions Committee should discuss the matter at a joint conference.

SILENCER TRIAL.—A special sub-committee, consisting of Messrs. J. W. C. Brooker, E. M. P. Boileau, A. Sharp, V. Hart, H. P. E. Harding, Col. H. C. L. Holden, R.A., F.R.S., and Dr. Watson, F.R.S., has been elected to draw up details and fix a date.

SIX DAYS' TRIAL AND BROOKLANDS.—The A.C.U., after further consideration, has definitely decided to abandon the idea of finishing the Six Days' Trial at Brooklands, feeling that it would be undesirable to leave Taunton before the full six days had been completed, since so cordial an invitation had been received from the inhabitants of the Somerset capital, from the Mayor downwards. Consequently the kind offer of the Stewart-Precision Carburetter Co. to defray the cost, mentioned in our last issue, cannot be accepted. However, in 1913 we understand the Brooklands proposal will receive further careful consideration before any centre is decided upon.

INTERNATIONAL COMPETITIONS.—The Auto Cycle Union has decided to send a team of riders to compete in the A.C.C.F. Easter reliability trial. Every endeavour will be made to organise the visit on economical lines, and with a view to making the competitors as comfortable as possible. Entries, by the request of the Auto Cycle Club of France, will be confined to members of the Union and of clubs affiliated to it. Intending competitors should send in their names to the Secretary of the Auto Cycle Union, 89, Pall Mall, S.W. The event is the outcome of W. Cooper's suggestion.

The Auto Cycle Union Ninth Annual Dinner.

ON Saturday evening last the ninth annual dinner of the Auto Cycle Union was held at the Waldorf Hotel. The event was one of the most successful of its kind ever held. The arrangements were excellent. as separate tables were placed in front of the high table, the speeches were good and to the point, and the musical entertainment was of the highest order. For the latter Mr. W. Rouse was responsible.

After the loyal toasts, Mr. G. D. Dean, legal representative of the R.A.C. and A.C.U., rose to propose "The Auto Cycle Union." He began his remarks by mentioning how in his early motoring days he had had the greatest contempt for the motor cycle, and how, when it had at last occurred to him that a motor bicycle would be handy for getting quickly from one place to another, he had tried one which had been procured by Mr. Straight, and in the use of which he had received instructions from Mr. Beasley. He had ridden it to Grantham and other places. Then, and only then, did he realise how much the A.C.U. had done to perfect the modern motor cycle. The A.C.U.'s work was not, however, finished. Thinking of the Holywell Hill test at St. Albans, which took place that very morning, why, Mr. Dean asked, could not single-geared motor bicycles be made to climb steep hills slowly, and why could not further improvements be made in silencers? Touching on the benefits members received from the governing body, the speaker mentioned the case of a member whose subscription was but 5s. per annum costing the A.C.U. £25 in legal expenses. Not only did it cost him nothing to win his case, but he saved the cost of his defence, and had he lost his opponent's solicitor's fees would also have been saved to him.

Definition of a Motor Cycle.

Mr. Robert Todd (chairman), in reply, mentioned in the course of his speech the difficulty of defining what a motor cycle was. The matter had come before the R.A.C. committee, a member of which said the definition was an easy one. He was asked to define a motor cycle, but broke down hopelessly in the attempt, and the committee gave it up. There was a new type of light motor vehicle (quadcars). If it were decided to be a motor cycle, the A.C.U. would look after its interests; if it were decided to be a car, the R.A.C. would further its development. At present no one knew. Mr. Dean had grumbled because a motor bicycle did not like going up a hill at ten miles an hour. In his (the speaker's) very early days, they thought it lucky if the machine would go uphill at *any* miles an hour. Speaking of the growth of the A.C.U., at the end of 1910 the total membership was 2,700, and now it was 5,000, and still growing. As regards the Tourist Trophy Race, the trophy itself was now in America. That was rather a good thing, emphasising the international aspect of the race. He referred to O. C. Godfrey, the plucky winner, who was present at the dinner. The I.O.M. Highway Board agreed that the race should take place in the island, and recommended the Tynwald Court to grant the necessary permission. Whether that permission were granted or not, the race would be held all the same.

The R.A.C. and its Affiliated Clubs.

Mr. Otto Thomas (*The Motor Cycle*) then proposed the toast of "The Royal Automobile Club and its Affiliated Clubs." Since he had been a member of the A.C.U. he had realised more and more how much that body had been indebted to the R.A.C., and how closely the affiliated clubs and the individual members of the Union were bound to the parent body.

Speaking of the R.A.C. members who had given valuable assistance to the A.C.U., there was Mr. Robert Todd, the chairman, whom the speaker regretted he did not see often enough at committee meetings; Colonel Holden, whose technical knowledge had been of such great value, and who had made a study of the motor bicycle from early times; Mr. J. R. Nisbet, whose level-headed views were so heartily welcomed on the committee; Mr. Beevor, whose weighty remarks were often heard on these occasions; Mr. J. W. Orde, who was always ready and anxious to help the A.C.U.; and Mr. G. D. Dean, who had helped so many members out of legal scrapes. Referring to the growth of the Auto Cycle Union, he mentioned how its increasing prosperity had been largely due to the work of its secretary, Mr. F. Straight.

Mr. J. W. Orde, in reply, speaking of Mr. Dean's early motor cycle experiences, said that he himself had not been so lucky; he had had to teach himself how to use his machine, and he had done even better—he had taught someone else. This was in 1903, before the Gordon-Bennett race in Ireland. The secretary of the Kildare County Council had borrowed his 2¼ h.p. motor bicycle, and had received instructions in all points except as regards stopping. He had therefore had to travel miles beyond his destination, as he did not know how to pull up, and had pedalled the machine back against compression, and had arrived more dead than alive.

The Chairman.

In rising to propose the toast of "The Chairman," Colonel Holden, C.B., R.A., F.R.S., said that Mr. Dean had mentioned how the work of the A.C.U. had perfected the modern motor bicycle. Mr. Todd, on the other hand, had worked towards the perfection of the Auto Cycle Union. Referring to the able speech of Mr. Otto Thomas, that gentleman, he said, had adopted the principle of the "Otto" cycle, and had exhausted his subject. He thought that ten-mile speed limits up hill should be abolished, as an excess of that speed up hill was always safe.

Mr. Todd suitably replied, and the proceedings finished with the singing of Auld Lang Syne.

SATURDAY'S QUARTERLY TRIAL (NEW SERIES). Three of the sidecar machines leaving Tring.

ENGLISH-DUTCH RELIABILITY TRIAL.

NOW that sufficient entries have been received from English motor cyclists to compose three teams in the above International contest, to be held in Holland on August 5th, we may subdivide the entries into the different classes in order to gain some idea of the possible formation of the English amateur and trade sections. The actual teams will be chosen from the following:

PRIVATE OWNERS.

Class A. Machines up to 340 c.c.	Class B. Machines from 340 c.c. to 500 c.c.	Class C. Machines from 500 to 1,000 c.c.
J. C. Bennett (2¾ Douglas)	Geoffrey Smith (3½ Rudge)	W. Cooper (3½ Bradbury)
Mitchell (2¾ Douglas)	Vernon Taylor (3½ Rudge)	L. A. Paddeley (7 Indian)
H. M. Carter (2¾ Douglas)	Seymour Smith (3½ Norton)	W. O. Oldman (Bat)
	Fred Dover (3½ Premier)	C. W. Wilson (Morgan runabout)
	A. E. Uffleman (3½ Humber)	Gordon B. McKechnie (8 Dot-Jap)
	C. C. Cooke (3½ Triumph)	André Marheim (T.A.C. sidecar)
	Horatio Wallis (1912 Triumph)	E. B. Ware (Chater-Lea sc.)
	Richard Cussons (3½ New Hudson)	

F. C. Wasley and F. A. Hardy, machines not stated.

TRADE TEAM.

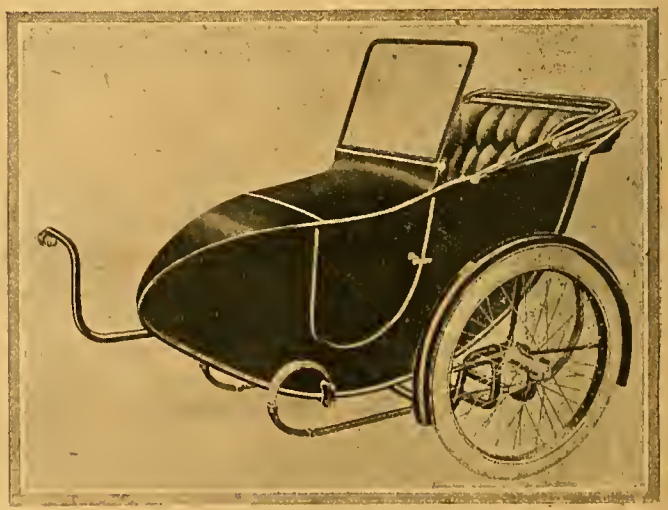
Class A. Machines up to 340 c.c.	Class B. Machines from 340 c.c. to 500 c.c.	Class C. Machines from 500 to 1,000 c.c.
W. W. Douglas (2¾ Douglas)	W. Pratt (3½ P. and M.)	F. W. Barnes (6 Zerith)
R. Holloway (2½ Premier)	J. Woodhouse (3½ Precision)	Hugh Gibson (3½ Bradbury)
Sam Wright (2¾ Humber)	W. F. Newsome (3½ Triumph)	W. H. Wells (7 Indian)
H. V. Colver (2¾ Enfield)	Roy W. Walker (3½ New Hudson)	Frank Smith (5-6 Clyno)
R. G. Mundy (2½ Singer)	F. C. North (3½ Ariel)	R. Lord (6 Rex sidette)
H. Graham Dixon (2¾ New Hudson)	Geo. Brough (3½ Brough)	
J. S. Holroyd (Motosacoche)		

LADIES' SECTION.

Mrs. A. Wade (3¾ Scott) | Mrs. C. C. Cooke (3½ Triumph)

Entrants are requested to state the h.p. and capacity of their machines.

It has been suggested to the organising body—the Dutch Motor Cycle Club—that the teams be increased to nine or twelve, seeing that the event is proving so popular. In any case it is possible that some form of competition will be evolved by the Dutch Club for those entrants who are anxious to cross over to Holland with the English party, whether chosen as one of the team or not.



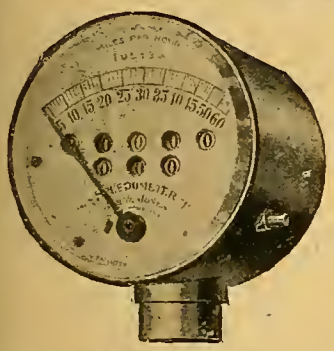
North-countrymen will especially be interested in the brochures which the Hull and Netherlands Steamship Co., Ltd., are circulating among the entrants. They contain much information of value to motorists intending to visit Holland. The Hull-Rotterdam route is certainly a good alternative, as there is a daily service, and the first-class return saloon fare is only 20s., whilst the cost of a motor bicycle in the possession of a passenger is 5s. each way. By this route intending competitors and their friends could leave Hull (Riverside Quay) on the Friday night, August 2nd, spend Saturday at their leisure, and stay the night in The Hague at the hotel, where they would meet the Harwich contingent at breakfast on the Sunday morning.

An alternative scheme would be to cross to Rotterdam on the Saturday night, and ride from Rotterdam to The Hague or Scheveningen, and pick up the other party there.

THE LATEST "MILLFORD" SIDECAR.

THERE is an indication that the sidecarist who intends to go in for serious touring will not be satisfied this year with the ordinary protection provided by an apron. Where cost is no consideration, lady passengers usually have a preference for a well-upholstered body with side doors and torpedo front. Popular demand also asks, so we are informed by Mills-Fulford, for a chassis and body with as low a position as possible. This firm has, therefore, applied for the registration of a frame design which we illustrate. This frame enables the body to be slung as close to the ground as is consistent with safety, the actual clearance being 5½in. The body is coach built of three-ply wood and luxuriously upholstered, the front portion being entirely covered in, so that when the hood and screen are up the passenger is protected from the very worst weather. When out of use the screen lies on the top of the torpedo front. The body is carried on the usual type of "Millford" springs at the rear, but in front leaf springs of the "C" type are connected by shackles to the body, which should ensure the utmost comfort for the passenger. The new model is called the "Millford Cabrio," and can also be supplied with other types of bodies than the one illustrated, made of cane or wicker.

Messrs. Mills-Fulford, whose address is Crown Works, Coventry, have just issued a new catalogue.



The new "Millford Cabrio" sidecar with dropped frame.

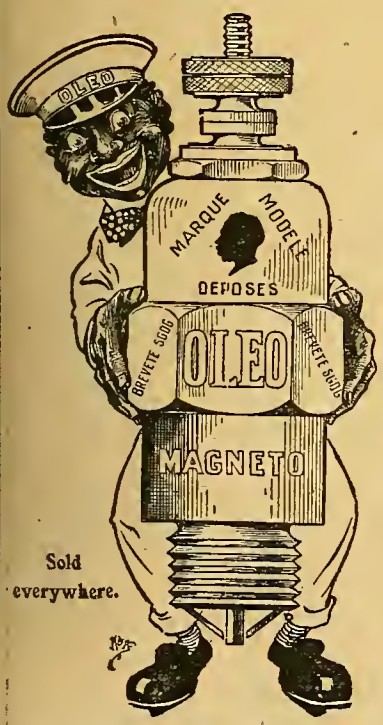
STEADY AS A ROCK!

Accurate as the Greenwich Time Ball!!

The "JONES" Motor Cycle Speedometer

A Correspondent writes recently:
"Thanks for prompt attention re Jones' Speedometer. Hope it will be as reliable as the old one—she did 40,000 miles and is still going strong on the machine I sold."

An accurate and reliable instrument—the favourite of speedmen and the chosen of Harry Long, the World's Record Holder.



All Models showing speed to either 60 or 80 M.P.H.

PRICES.

Model 26—Mileage to 10,000 and repeat	£3 3 0
Model 31—Mileage to 10,000 and repeat, and Trip recorder	4 4 0
Model 32—Ditto with Maximum Speed Hand	5 5 0
With reliable Watch attached (either model) .... Extra	1 1 0

London-Gloucester Open Reliability Trial.

Dear Sirs,

I have the pleasure to inform you that I have been successful in qualifying for a SILVER CUP in the above.

Your plug fired PERFECTLY during the entire run in spite of MUD AND RAIN, it seemed to me PARTICULARLY SUITABLE for a high compression engine like the TRIUMPH.

Thanking you for your KIND HELP.

I am dear Sirs,
Yours faithfully,
GLYNN ROWDEN.

"MODEL FLYING MACHINES"

Their Design and Construction

(Second Edition).

Revised throughout, Enlarged, and brought right up to date.

A handbook devoted to the construction of practical models of flying machines of all types. The greater part of the book is devoted to aeroplane models, but special chapters are included, dealing with direct lift and flapping wing types, and also with model dirigibles.

Profusely illustrated from drawings by the author.

The advice given is the result of the personal experience of the writer, and the book will be found of the utmost service to all who follow the fascinating and instructive hobby of making and flying models.

PRICE **1/-** Net.

Obtainable from the Publishers of "THE AERO," ILIFFE & SONS LTD., 20, Tudor Street, London, E.C., and all the leading booksellers.

Remittance must accompany post orders.

SINCE

A number of motor agents, etc., talk about genuine guaranteed and overhauled second-hand machines, we respectfully suggest that a buyer asks "what facilities they have for *thoroughly* overhauling a motor cycle." Give us a call, see how *we* overhaul a second-hand machine, and *be* satisfied.

WE GUARANTEE EVERY SECOND-HAND MACHINE WE SELL.

A selection from our list of good reliable second hand machines:

THE ONLY MOTOR CYCLE THAT COMBINES ALL THE QUALITIES ESSENTIAL FOR SIDECAR WORK. :: :: :: :: ::

Satisfaction has never overwhelmed the users of Sidecar Machines—those owners have always felt that there was something to be desired. May be they wanted a stronger frame, a more powerful and flexible engine, better brakes. Probably they wanted less noise, easier starting, efficient front and rear springing, and more substantial tyres and rims. It seems at any rate that there was always something lacking.

BUT NOW *comes the* 1912 *REX-J.A.P., profiting by the mistakes of the past, with a motor cycle that has eliminated these weaknesses—fitted with the world-famous J.A.P. Engine—especially strengthened frame with brazed on lugs, ensuring perfect alignment of sidecar—powerful brakes—spring cantilever seat and spring forks—exceptionally large tyres—automatic lubricator, with auxiliary hand operated pump—and many other exclusive features which place the REX-J.A.P. far and away above all other Motor Cycles in regard to Reliability, Comfort, Ease of Handling, Flexibility, and Economy.*

Write now for Catalogue, it will interest you.

TO DEALERS—The REX-J.A.P. Agency proposition is worth consideration—we invite your correspondence.

COLONIAL AGENTS—The REX-J.A.P. Colonial Models, with *Special Frame, Wheels, and increased ground clearance*, will interest you. We are now appointing Sole Agents, and shall be pleased to post you terms.

This Year's Tourist Trophy Races.

PERMISSION has been granted by the Tynwald Court to hold the great road races of the year in the Isle of Man, and we are glad to chronicle the news, as the island has always given us a hearty welcome and its roads offer a far better test for motor cycles than those of Northern France. In the telegram announcing the Tynwald Court's decision certain conditions are put forward, among them that steps will be taken to prevent competitors annoying people. This, we are sorry to say, is quite justified after what occurred last year, and we can only hope that the conduct of all concerned this year will be such that we shall have no occasion to refer again to the question of behaviour. The next condition is that silencers will be necessary and expected. This need not worry the authorities unduly. The A.C.U. has taken up a firm attitude in this direction, and in the T.T. and other events held during the year silent machines will be a necessity. Entrants and riders of noisy machines will be penalised by the judges. The third condition states that the course will be the old one—St. John's, Ballacraine, Kirk Michael, Peel, and back to St. John's. It is difficult to realise why the old course should be recommended, if such be really the case, as the mountain road course proved to be so immeasurably superior last year. As a test it was unrivalled, and both machines and riders were hard put to it. Will the splendid trial imposed upon change-speed gears be so easily forgotten? We think not. These most desirable devices proved their worth on this occasion to the whole motor cycle public with a rapidity and in a manner that could not otherwise have been attained. Most competitors were, through the severity of the course, compelled to fit them, and with a result that is now well known.

Although the race will be run this year without the support of the majority of the trade a good entry will probably be received, and if this be the case the short course will be overcrowded, and rendered more dangerous than the long one. It has corners enough in it in all conscience, and should bunching take place the danger would be very marked.

During the discussion as to whether or not the Tynwald Court would grant permission for the race to be held, we learn that a letter was read from the Manufacturers' Union urging the Tynwald Court to refuse permission for reasons which those members of the court who were in favour of holding the races are said to have described as "absolutely absurd, and which were easily answered." We have the highest respect for the Manufacturers' Union, but we certainly think that as practically all the members interested in the race have signed a bond not to compete in a T.T. Race in the Isle of Man they might have reasonably left the application of the A.C.U. to take its natural course without endeavouring to influence the Island authorities into a refusal. It is not too late for the bond signatories to change their minds, and if they do decide on such a unanimous action we are sure our readers would praise them. If they do not, a race between private owners will make a most sporting contest of the T.T. Race, and we urge them to begin sending in their entries at once. If the A.C.U. decide to make the races invitation events this year we do not see that it would detract from the number of entries, and their control of the competition would thereby be materially strengthened.

TWO-STROKE ENGINES.

ALTHOUGH the four-stroke engine for motor cycle work has a great numerical preponderance over the two-stroke, there is not the slightest doubt that the latter type of engine is winning its way to favour, which it may easily lay claim to by reason of its many advantages. It must not be forgotten, however, that there are disadvantages inherently connected with the two-stroke principle, and it is the intention of this article to discuss these engines from both points of view.

First of all, however, it is necessary to point out that the name "two-cycle" engine is a misnomer, both two-stroke and four-stroke engines working upon the Otto cycle of four operations, viz., suction, compression, expansion, and exhaustion. Hence, both are four-cycle engines, one carrying out the cycle of operations with four strokes of the piston, and the other with two strokes.

Two-stroke engines may be divided into two classes. First, those which make use of the space both above and below the piston, and employ, therefore, a crank chamber compression; secondly, those in which a separate cylinder is employed to perform the office of a pump. Examples of both types were shown at Olympia, the Scott, the Levis, and the Stuart coming into the first category, and the Wooler into the second. In this last case a single double-ended piston is employed both for power and for pumping, but the effect is exactly the same as if a separate piston and cylinder were employed for this secondary purpose, as in the case of the old Bichrone motor cycle engine, and Lamplugh and Dolphin engines which have been used on cars. Two-stroke motors belonging to the first type may be again sub-divided into two further classes, viz., those in which the piston performs all valvular offices, and second, those in which additional valves are employed.

The Engines Classified.

The two-stroke engines at Olympia could be therefore grouped as follows:

Type I.—With crank chamber compression.

A, without valves, Scott and Levis.

B, with valves, Stuart.

Type II.—Pump compression.

The Wooler.

Another mode of classifying the first group would be to describe the Scott and the Levis as engines of the three-port type, whilst the Stuart is one of the two-port type, and so also is the Wooler.

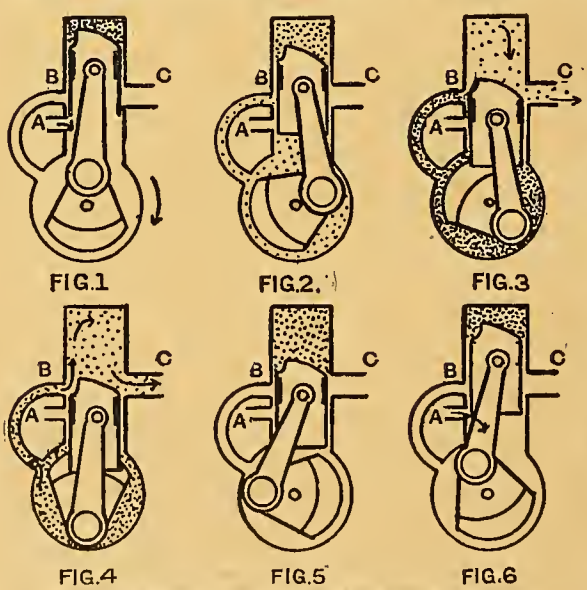
Although the arrangement of the ports in the Wooler and Scott is not the same, the principle in both these engines is identical, and a single description will, therefore, serve for both.

Before proceeding to this, however, it will be advisable to consider the essential differences between four-stroke and two-stroke engines. The advantages of the latter are as follows:

I.—Superiority of torque, the torque of a two-stroke engine being twice as good as that of a four-stroke engine with the same number of cylinders.

II.—Silence. A two-stroke engine need not have any other valve except the piston, and therefore noisy tappets and their gear are done away with.

III.—Ease and cheapness of manufacture, which follow upon the use of an engine with practically only three moving parts, viz., crankshaft, connecting rod and piston.



On the other side of the picture the disadvantages are as follow:

I.—Decrease of efficiency owing to the difficulty of obtaining a cylinder really full of explosive gas.

II.—Inflexibility, since if a crank chamber compression be used the suction upon the carburetter when the engine is running at low speeds is very slight, and the likelihood of leakage is enhanced.

III.—Difficulty of keeping the piston thoroughly gastight. This part acts not only as a piston, but as a valve, and slackness therefore makes its ill effects felt in two different ways. Hence in a two-stroke engine it may be reckoned that a given degree of slackness in the piston will cause at least double the loss of power that it would do in a four-stroke.

IV.—Difficulty of preventing the plug points being burned away, since there is no idle stroke during which they are cooled.

Diagrams of the Scott two-stroke engine showing the operations.

The Piston as a Valve.

Of the disadvantages only the third requires anything in the nature of an explanation. It will readily be understood that the piston cannot serve its two purposes equally well. As a valve it is essential that it be an absolutely tight fit in the cylinder, whilst if it were made so it would not be long before it would refuse to work under these conditions as a piston. A compromise has therefore to be struck, but help in this matter is obtained from a source which scarcely enters into the consideration of four-stroke engines, viz., the lateral thrust of the piston upon the cylinder walls. Looking sideways at a clockwise running engine (as in fig. 2), it will be realised that owing to the obliquity of the connecting rod, the piston on its power stroke exercises a thrust upon the rear wall of the cylinder. Whilst on the compression stroke the thrust is against the opposite wall. At no time during the stroke, however, is there any thrust on the sides of the cylinder walls, but only in front and behind. Since a certain degree of slackness in the piston is a paramount necessity, only by one means can its ill effects be remedied, viz., by so placing the valve ports that the side thrust of the piston ensures its covering them with as nearly as possible a gastight fit. Even if this be done, however, it will be realised that if this thrust be making the piston tight over one port it is making it slack over the other and *vice versa*. Any ill result from this cause, however, can be minimised by placing the inlet port on the back side of the cylinder, and the exhaust port on the front, as in this way any blow back to the inlet pipe is entirely prevented, whilst such leakage as there may be simply allows the gas to percolate through to the exhaust where it can do no harm.

Water-cooling.

Inasmuch as with uniform and efficient cooling slackness between the piston and the cylinder walls is produced with less rapidity and to a less grievous extent than if the cooling be not uniform, the best results so far as life and maintenance of power are concerned are obtained with water-cooled two-stroke engines, and this to an extent much more marked than in the case of four-stroke engines.

The accompanying diagrams show the working of the Scott and Levis engines,

Two-stroke Engines.—

the sections being diagrammatically those of a single Scott cylinder, which, however, differs in two important points from that of the Levis, in which the inlet port between the crank chamber and the carburetter is placed on the side of the cylinder instead of at the back, and that the cylinder of the Levis is not offset. The reference letters are:

A—Inlet pipe connecting crank chamber to carburetter.

B—Transfer port (shown larger than actual size) connecting crank chamber and cylinder.

C—Exhaust port registering with piston at the end of its stroke.

In fig. 1 the piston is at the top of its stroke, and explosion of the mixture above it has taken place, and is about to commence the power stroke. The crank chamber is also full of explosive mixture, having received a charge in a manner to be explained. The port at the top of the transfer passage is closed, and likewise is the exhaust port. The inlet port is open and the pressure inside the crank chamber is therefore atmospheric.

In fig. 2 the piston has descended through one-third of its power stroke, and the exploded gases are expanding above it. Its first act is to close the inlet port, and compression in the crank chamber now begins to take place, both crank chamber ports being closed. It will be realised that the volumetric capacity of the crank chamber is at its greatest when the piston is at the top of its stroke, and at its least when the piston is at the bottom of its stroke.

In fig. 3 the piston has descended through another third of its stroke. The transfer passage port and crank chamber inlet port are still both closed, but the exhaust port is commencing to open. Its own expansion causes at this point the major portion of the exploded gases to exhaust themselves.

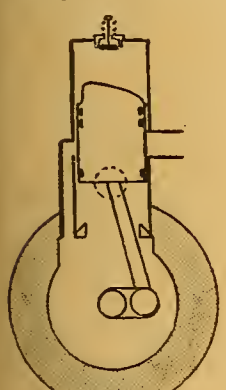


Fig. 7.—Diagram of the Levis engine.

A further stage of one-third of a stroke is shown at fig. 4, which represents the piston at the bottom of its travel. The exhaust port is now fully open, and a connection is established between the crank chamber and the cylinder by means of the transfer passage port having been opened by the piston. The gases which, in the two previous diagrams, have been compressed in the crank chamber are now forced through this passage, and strike the deflector at the top of the piston, which throws them upwards and enables them to force out what is left of the exploded charge through the exhaust port. The inlet port of the crank chamber is closed.

In the next stage, fig. 5, the piston is shown half-way on the up-stroke, when it is in the act of compressing the gases in the cylinder.

Since the piston is rising a negative pressure is being created in the crank chamber, and as the ports of the latter are entirely closed this pressure gets lower and lower as the piston ascends, until it arrives at the point shown in fig. 6, which represents the engine a few degrees before the top of the stroke. The inlet port is now suddenly opened by the bottom edge of the piston and gas accordingly rushes into the crank chamber from the carburetter. In the top of the cylinder the gases are compressed ready to be fired.

The principle of getting a considerable negative pressure in the crank chamber before allowing a flow of gas from the carburetter thereto is very desirable, since it makes the speed of the air past the jet very much higher and therefore better for carburation purposes than if on the crank chamber suction stroke the crank chamber were connected to the carburetter the whole time.

Special Scott Features.

The following mechanical details of the Scott engine deserve particular attention. In the matter of rings, the top of the piston is provided with the usual stiff ones common to all types of explosion engines, whilst at the bottom of its trunk it has a fourth ring the spring of which is quite light. The function of this ring is simply to prevent the leakage of gas between the piston and the cylinder walls, as for instance in fig. 2. Here the gases in the crank chamber are being compressed whilst the piston is being driven downwards by the force of the exploded gas above it. The side thrust of the piston is, therefore, on the left-hand wall of the cylinder, which means that while the inlet and transfer ports are totally closed any slack of the piston itself is all on the side which is intended to close the exhaust valve, hence unless there were a bottom ring the compressed gases in the crank chamber might easily escape into the exhaust port.

The next point is the exceedingly neat metallic packing which is used on the main crankshaft bearings in order to keep the crank chamber compression-tight. Briefly described, this packing consists of two hardened steel discs held together by a spring. The lubrication system includes an ingenious pump which is incorporated in this packing gland, but this was fully described in the issue of *The Motor Cycle* of December 21st.

In order to effect a release of the compression for easy starting, the Scott engine is fitted with a small mushroom valve. This is let into the cylinder wall immediately above the exhaust port. There is a very good reason for this position, which may seem to some otherwise inexplicable, namely, that here the valve (which is at best only occasionally used) is protected from the full force and initial heat of the explosion.

The Levis.

Diagrammatically, any of the previous figures 1 to 6 might be used to show the arrangement of the Levis, but as the ports are differently placed, the inlet port being at the side of the engine instead of at the back, a separate sketch, fig. 7, is given. In this it will be seen that the transfer port is cast in the lower part of the cylinder itself and runs parallel with its bore. It is accordingly opened when the piston is approaching the bottom of its stroke. The negative pressure developed in the crank chamber induces a rapid rush of air from the carburetter, the same as in the case of the Scott. The engine is air-cooled, and has a compression release valve situated in the cylinder head, where it is kept closed by a spring and operated from the handle-bar by a Bowden wire. One of the most interesting features of the Levis engine is that, owing to the ingenious system of lubrication, the crank chamber is kept free from oil, and accordingly the gas passed through the transfer port is as pure as possible. As indicated in the sketch, the crank chamber where it abuts against the base of the cylinder is furnished with a groove into which the bottom of the piston wall dips at the end of every stroke. Oil is fed to a port cast in the side of the cylinder, which port is level with the gudgeon pin at the bottom of the piston stroke. The gudgeon pin is hollow, and hence not only does the oil flow right through it to the further cylinder wall, but it also, in passing, lubricates the gudgeon pin bearings by means of transverse holes. Any excess of oil on the cylinder walls drips down into the aforementioned groove, whence it is conveyed to the main bearings through internal ducts. In consequence, the crankshaft bearings are thoroughly well lubricated, which, in conjunction with their great length, dispenses with packing. The crankshaft is hollow, and oil contained therein is thrown to the big end bearing through its internal ducts by centrifugal force.

As in the Scott, the piston is furnished with a ring at its base.

The Stuart.

We now come to two-stroke engines of the two-port type, of which the first example is the Stuart. The manner in which this engine is arranged is shown in fig. 8. There are two ports, viz., B, the exhaust, and A the inlet connected with the crank chamber through the transfer port. In the sketch the piston is shown at the bottom of the stroke, at which point the gases compressed in the crank chamber pass upward through the transfer port, strike the deflector at the top of the piston, and, in descending, hurry the exhaust gases out at the opposite side. After this, compression of the gases above the piston takes place in the usual manner, whilst, as soon as the piston covers ports A and B, the crank chamber, which now has a partial vacuum forming in it by the ascent of the piston, is placed in direct communication with the carburetter, which is connected to pipe C. Between this pipe and the crank chamber is a non-return automatic inlet valve which, on the descent of the piston on the power stroke, allows the gases in the

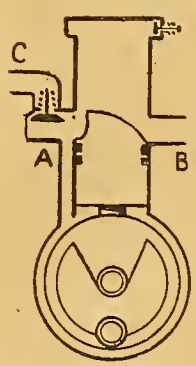

Fig. 8.—The Stuart two-port engine.

Two-stroke Engines.—

crank chamber to be compressed ready to be injected into the cylinder the moment the top of the piston uncovers the port B. This inlet valve is adjustable as to the length of its stroke, and is carried in a quickly detachable cage.

It will be seen from the design of the engine that the thrust pressure of the piston upon the cylinder walls is made of the utmost possible use, the only theoretical disadvantage being the employment of an automatic valve. The design of all engines is, and always has been, a compromise, and whilst the use of a valve has its disadvantages, as we shall show, nevertheless it has counteracting benefits. It is not to be denied, however, that a two-stroke engine containing valves is not, and never can be, suitable for very high speeds. On the other hand, the Stuart engine has been designed as a touring machine and not a racer. It therefore feels the disadvantageous effect of having a valve much less than if it were intended to be driven at high speed.

Disadvantages of Automatic Valves.

Assuming that the engine is run at the rate of 2,000 revolutions per minute, and that the opening and closing of the inlet valve is accomplished within the range of two-thirds of the piston stroke (as a matter of fact it is probably slightly less), this means that the valve has to open, let gas through, and close, within a period of approximately one-hundredth of a second. At very high speeds, therefore, it is clear that some attenuation of the inlet gases is unavoidable.

As shown in the sketch the compression release valve is fitted at the side of the cylinder head. the gas allowed to pass through it being directed into the exhaust pipe through a small subsidiary tube.

In order to provide against the risk of a back-fire occurring in the crank chamber, to which a two-stroke engine of the crank case compression type is subject when supplied with too weak a mixture, a special release valve is fitted on the crank chamber to allow any great excess of pressure to be released. A second valve is attached to the crank chamber and consists of a non-return one, by means of which positive pressure is directed to an oil tank and forces the lubricant through an adjustable sight feed on the top tube, to a port let into the back cylinder wall so as to keep the sides of the piston thoroughly lubricated.

The Wooler.

Fig. 9 shows the diagrammatical arrangement of the Wooler engine, which is of a unique type, possessing many points of interest. The cylinder is double-ended, as is also the piston, the

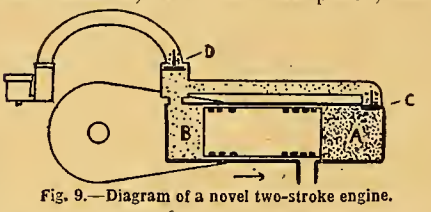

Fig. 9.—Diagram of a novel two-stroke engine.

end A being the working explosion cylinder, whilst B is a pump. For this purpose it is necessary to carry connecting rods outside of the cylinder, and they are arranged in plain form, as shown in fig. 10, which indicates how two slots are cut in the slides of the horizontal cylinder walls in order to allow the gudgeon pin bearing to pass. It will be remembered that a somewhat similar device was used in the two-stroke engine of the Wall Auto-wheel. The piston is to all intents and purposes a hollow cylinder closed at each end, one of the notable points in connection with the Wooler engine being that the gudgeon pin is fixed to the connecting rods and turns in the piston, which is specially bushed for this purpose. The ends of the pistons have no baffle-plates, and are provided with no less than seven rings—four at the explosion end and three at the other. The *modus operandi* is very simple, and requires no explanation at all. if the pump cylinder be regarded as the crank case of the previous diagrams.

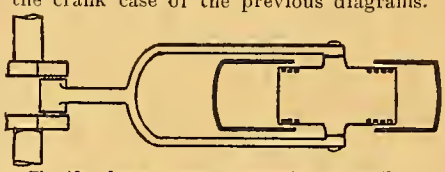

Fig. 10.—Arrangement of connecting rods on the Wooler engine.

There is, however, one important difference between the Wooler engine and the others already described, namely, that in this case there are two automatic valves—one is placed in the cylinder head and is a real inlet valve, the other is situated at a branch of the transfer pipe and carburetter and merely performs the function of a cut-off valve. The exhaust port is cast with the cylinder at the bottom of the piston's working stroke. When the piston is moving from left to right, as shown by an arrow in the diagram, a negative pressure is created in the pump cylinder. The check valve D accordingly opens, thus allowing the suction to have effect upon the carburetter, and accordingly the pump cylinder is filled with explosive gas.

On the return stroke—that is to say, when the piston is moving from right to left—this gas is forced from the pump cylinder into the transfer pipe, where its pressure immediately causes the valve D to close. The pump pressure is accordingly accumulated in the transfer pipe until, the piston having uncovered the exhaust port, the explosion pressure is reduced in the firing cylinder sufficiently to allow the pressure in the transfer pipe to open the inlet valve C. The fresh gases rushing in, scavenge the cylinder by helping to force the exhaust gases through their port, and incidentally cooling and cleaning the sparking plug points, which are wisely placed immediately in the stream of cool fresh gas.

The complete cycle of operations takes, of course, only two strokes, since on the one there is induction of gas in the pump and compression of gas in the working cylinder, and on the other exhaustion of gas from the pump and explosion of gas in the working cylinder.

It will be at once realised that there is one great advantage of the Wooler engine and one great disadvantage. To take the latter first, it consists, as explained in the case of the Stuart, of the difficulty which two automatic valves have of acting adequately in the very short space of time allowed them.

On the other hand, without introducing any additional working parts, crank chamber compression is done away with in favour of a piston pump in which, of course, the clearances are much less and whose efficiency, both as an inducer and a supplier of gas to the cylinder, is accordingly much better than the more usual crank chamber arrangement.

Both of these points are of very great importance—indeed the whole future of this engine depends, one may say, upon whether the value of the pump can be made to counteract the effect of the automatic inlet valves. It may, however, with no injustice be pointed out that incidentally a second disadvantage is introduced by the number of additional working parts and the consequent manufacturing difficulties and costs which these two valves introduce.

W.G.A.

A RUN ON THE ROLLO.

A VISIT to the Rollo works at Conybere Street, Birmingham, proved a revelation in the manufacture of quadcars. We found them small but extremely well equipped works, which, by reason of their system of jigs and the up-to-date lines on which they are run, are capable of producing as many as ten machines per week.

For a detailed description of the Rollo quadcar we refer our readers to *The Motor Cycle* of November 30th, page 1316. Changes of gear ratio are effected by means of expanding pulleys, the belt slack being taken up by a movement of the rear axle. These two operations are synchronised in a simple and ingenious way, and are brought about by the movement of a single lever. An unusual feature for this type of gear is that by merely depressing a pedal a free engine position can be obtained without altering the gear, the depression of the pedal temporarily disconnecting the rear axle sliding motion and expanding the pulleys to their full extent.

A short run convinced us that the machine is very practical, and handy in traffic. The tandem body is well suspended, and, in spite of the fearful state of the roads we traversed, we suffered from no unpleasant jars. The engine pulls well, and when travelling the vibration is scarcely noticeable. We made a standing start on a gradient of about 1 in 15, with the road covered in snow and slush. The engine took up the load smoothly and easily, and seemed to have plenty of power in hand.

The new 3½ h.p. Swift is, we understand, receiving a hearty welcome at the hands of the public. The Swift Cycle Co. is in the happy position of being able to guarantee an early delivery of this popular model.

Occasional Comments

by "Ixion"

Foot-starters.

It would be interesting to hear whether any users are having trouble with a common type of foot starter, on which the starting chain is out of line in one position or the other. We do not want to import another uncovered free wheel clutch, just when that tiresome fitting has been eliminated from the back spindle, and as a consequence many kick-starters are freed by sliding one of the sprockets laterally, *i.e.*, putting it out of truth; the shortness of the chain accentuates this lack of alignment. On most devices of the kind the alignment is true when the starter is being used, and out of truth when the starter is freed. This should not matter appreciably, provided the sprockets are lined up gently, before the sudden starting shove is given. But I noticed more than one device at Olympia which threw the jerk on the chain in its out-of-truth position, and considering the short centres, I expect these devices will be aggravating in use.

The best starting device I ever used was a strap starter on a 1902 quadricycle. As delivered, the strap was loose and normally carried in my pocket. A hole in the strap was hitched over a peg on a drum keyed to the gear spindle, the strap was wound round the drum, and then "pulled off"; before long we modified the device by attaching the strap permanently, adding a spring winder and a clutch to free the drum, after which the starter proved delightful; even a backfire could cause no trouble. A similar device, but very much improved, might be adapted to a motor bicycle, the strap ending in a stirrup resting in a stop on the right hand side of the machine at about the height of the tank bottom.

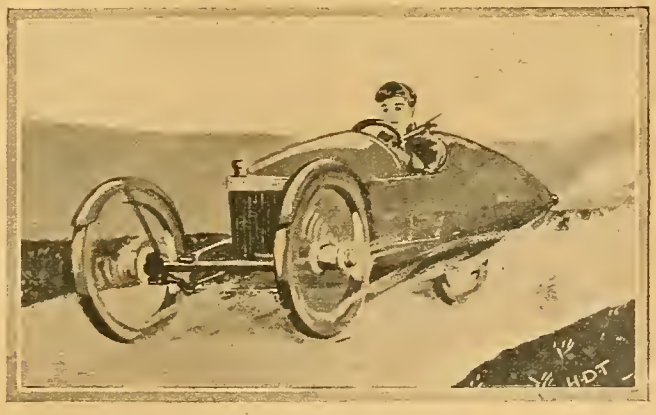
Rear Fork Adjusters.

A reader has sent me specifications for a patent covering a very simple form of adjuster, designed to set the rear wheel at varying distances from the engine, the adjustment allowing a range of two inches movement, without rendering the back wheel more difficult to detach. His idea is that such a device should be immensely serviceable on single-geared pedalless machines whenever the belt slips.

He points out that when a belt slips on such machines the rider chooses between (a) screwing up his engine pulley, which gives a higher gear ratio than is desired, and (b) cutting the belt, a messy and fiddling job.

There are two objections to his solution. The first is that the addition of his fitment will cost the manufacturer money for which there will be no adequate return; these detail refinements please the fastidious customer, but they seldom influence his choice of a machine, and the appeal they make is not sufficiently strong to justify increased prices; the other defect is that the periodic shortening of a belt, first at one end and then at the other, lessens the danger of a fastener screw pulling through. I doubt whether such a device can become commercially remunerative.

A Free Engine Refinement.



One or two of the latest free engine patents make allowance for rigid locking of the clutch, in the event of the friction surfaces being too small or becoming so slippery that the clutch fails to hold under a heavy load. I doubt whether this refinement possesses a future. If the contact areas of a clutch lose their efficient surface, it is usually possible to adjust the springs so that a driving grip is maintained; if they be too small it is surely a fault in design. Many years have elapsed since I was stranded with a permanently slipping clutch on a motor cycle.

Starting in Deep Snow.

The recent snowfall in the Midlands and North illuminated some of the difficulties of riding a motor bicycle with nearly a foot of snow on the ground. Once started, it was by no means impossible to make progress, for the soft feathery snow offered no very serious resistance to the passage of the machine, and if it was a trifle skidsome, its lightness presented no such difficulties as deep sand may do.

The real bother was to get started. It was difficult to push off a T.T. mount at sufficient speed to get the engine going, and when the engine fired there was always an exciting moment when the rider was poised between road and saddle—feet slipping and machine swerving during the second occupied in mounting. The free-engined men were little better off, for the back wheel spun round furiously in the snow when the load was applied.

In level districts the lightweights scored, because they were handier to start but they had not sufficient power to plough up gradients through the deep wet snow. In hilly neighbourhoods several riders with handlebar-controlled clutches report successful runs; they contrived to get under way by starting the engine, and gradually letting in the clutch by hand as they walked briskly alongside the machine. But emphatically the sidecar and quadcar men had the easiest time.

Our artist's idea of a stream-line body fitted to a three-wheeled runabout.

By W. Fawcett

TO THE TYROL AND BACK ON MOTOR CYCLES

(Concluded from page 88.)

In plain language, the surface of the Simplon pass is a disgrace—bumpy, loose, unrolled stones, and although the road rises just under 6,000 feet in twenty-four miles, this gives very little idea of the steepness, as there are several bits of level and some actually downhill.

Soon after leaving Gondo we entered the famous Gorge of that name, and the rocks tower over one's head on either side to a height of 2,000 feet. Shortly afterwards the Tressinone waterfall dashes down on the right hand and dives under the road, the spray blowing in your face. Almost before it is out of your eyes you enter a long tunnel having a bend in it, and the up grade on a greasy surface makes the fun furious while it lasts.

A few miles more of this bumpy road and I was pulled up, first with misfiring, due to a particle of metal across the plug points, and then again by a tumble on some unrolled stones. Once at the top we had coffee and rolls and a look at the Hospice, as we had plenty of time to spare.

All around the view is magnificent. The gigantic Jungfrau, Nesthorn, and other peaks, with their snow-clad summits, make an ideal picture, whilst the Aletsch Glacier, which, I believe, is the largest ice-field in the Alps, must not be forgotten.

A little further on we both took our belts off and free-wheeled for miles. We soon came to an avalanche tunnel or two, one in particular where a mountain torrent dashes over the roof and makes the road surface treacherous, for the water leaks through. The road was washed away in places, and one could plainly see where floods had recently swept all before them.

Swiss Motorphobia.

Again were we forcibly reminded of the Swiss anti-motorist feeling, for, too late, I saw some broken glass, business end upwards, carefully placed all across the road. Hastily putting up my hand I was too late to stop Billy, and a little time was spent in removing the glass and examining our tyres, which fortunately seemed none the worse.

Brigue was reached at last, and after the examination of our permits, to see we had not done the twenty-four miles under four hours, we were permitted to continue our way, but before doing so we made a point of reporting the glass incident.

Filling up with petrol at Brigue, we soon found the road improving, and we set off at a fair pace to make up for those six miles an hour. A practically straight road with the Rhône for company through Visp, Sierre, Sion, Martigny-Ville, then to the right and straight on again through St. Maurice, and we were asking for St. Gingolph, our destination for the day, but it only brought an uplifting of the eyebrow. Trying another person we were greeted with a blank stare. This was getting beyond a joke. Each time I pronounced it differently, so I decided to give the ladies a chance, but they actually ran, in desperation. I tried an old man in a doorway, and gave him all the variations of pronunciation I was capable of and waited. A smile came over his face, and he said, "Ah! Sangangolf!" all in one breath. Yes! just like that, "Sangangolf." At last we arrived at St. Gingolph, which is at one end of Lake Geneva.

We put up at the Hotel Terminus after a run of 116 miles, and found it the cheapest little hotel we stayed at, whilst the food and, Billy said, the wine were excellent.

Next morning I awoke to hear the rattle of open exhausts, and, rushing to the window, I saw about a dozen push cyclists stripped for the fray, with a car following bearing the official banner, whilst half a dozen motor cyclists rattled along in the rear. For hours we watched the race; it seemed to be a push cycle T.T., and many a competitor dashed up to a fountain near, jumped off his machine, ducked his head in the water, and was off again. One unfortunate punctured near us as we took our breakfast on the verandah, and I noticed his tyres were of the single tube variety, and that he wrapped insulating tape round and round the hole; his wheel also had a sprocket either side for altering the gear—another dodge!

Relaxation at Geneva.

Into the saddle once more—this time Billy leading—and so through Evian-les-Bains. I soon came to a fork in the road. Which was the way? My map showed no such fork, so, thinking Billy must be hugging the lake side, I did the same. Two more forks, and still I did not see him. Then my front tyre went down. I found the puncture and put a patch on, had a smoke, and put the tube back. Then I found my pump would not work, and many minutes were spent in faking it up.

Round every corner I expected to see the Bradbury propped up whilst its owner regaled himself with peaches and figs, but it was not to be, and I got quite anxious because, although we had arranged to stay at Geneva—it was only a few miles further on—we had not settled on which hotel, as there were several in the C.T.C. book. The reader will perhaps remember that we had been through Geneva on our way out, so I decided to make for the *café* where we had stopped for afternoon tea, and leave my bicycle in a prominent position and see if Billy turned up.

To the Tyrol and Back on Motor Cycles.—

I slowly crept through the traffic and over the bridge that spans the lake, and up what appears to be the main street, and so to the *café*, where I was surprised and glad to see Billy. The reason of our losing each other was that Billy had stopped in a very shady spot to locate a "squeak," and, as I passed, he waved to me to stop, but I was bending down to read my cyclometer. Hastily hopping on to his machine, he sped after me, but was almost immediately pounced upon by a customs officer, and made to turn the whole of his effects out, whilst he fretted and fumed to no purpose; after this, by taking a different fork, he had passed me when I was mending my tube.

We put up at the Hotel Terminus Baur after a short spin of thirty-seven miles.

That afternoon and the next day were spent in Geneva, on the lake, over at Luna Park—a kind of White City, with joy wheel, water splash, etc.—whilst the Kursaal kept us captive for the evening with a little play at "Petits Chevaux," till I found the odds were nine to one against winning, while if you won you only got six to one, which was not good enough for me.

The day before leaving Geneva we visited the C.T.C. consul, C. W. Mason, M.A., who gave us much valuable information about the roads we were to traverse.

Tuesday, August 1st, was gloriously fine, and we set off through St. Genis and Bellegarde, on the best road we had met with since leaving England. The scenery was very pretty, and we gradually entered a cleft in the hills, which drew nearer and nearer together till they almost met. When they seemed as though they were going to meet, we came across some fortifications, and we suddenly went over a drawbridge into what appeared to be a courtyard, much to a soldier's astonishment, and out at the other side. This, I understand, was Fort l'Ecluse, and would have made a perfect little picture, but I dared not risk an exposure. I do not remember if it was before or after this that we came to the French-Swiss frontier, where we again showed our C.T.C. tickets, but we were made to unpack.

A view of Lake Como, one of the beauty spots of Italy.

France Again and Good Roads.

Quickly we sped along, through Nantua and a bit of bad road, through Thoirette, when we were lost on a road that was apparently too insignificant for my map, but, though narrow, it had a fairly good surface, whilst the country was of the wildest, for we were now in the Jura mountains. We were enjoying ourselves, and did not care as long as our petrol held out and we could get a decent hotel to stay at if night came on. We eventually reached Bourg, and now locating ourselves on the map, we chose a good straight road and headed north, passing Montrevel, St. Trivier, Cuisery, and so into Châlon-sur Saône, where we put up at the Grand Hotel. This is the second time I have been to Châlon, and I may say, if possible, I should in future avoid it, as it appears to be devoid of interest. The day's run was of 125 miles.

Wednesday, August 2nd, and another glorious day, we set off on a road I knew from experience to be good. Passing through St. Leger, and just outside Autun, Billy ran short of petrol, but he scorned my proffered liquid, having got sufficient by lifting the front wheel up to carry him into the town. Tanks full up once more we again set off, and reached Saulieu, then Avallon, and after mending three punctures in Billy's tyres with patches cut in two to make them spin out, we reached Auxerre without further incident after a day's run of 118 miles, and put up at what I had previously found to be a good hotel—the Hotel de l'Epée.

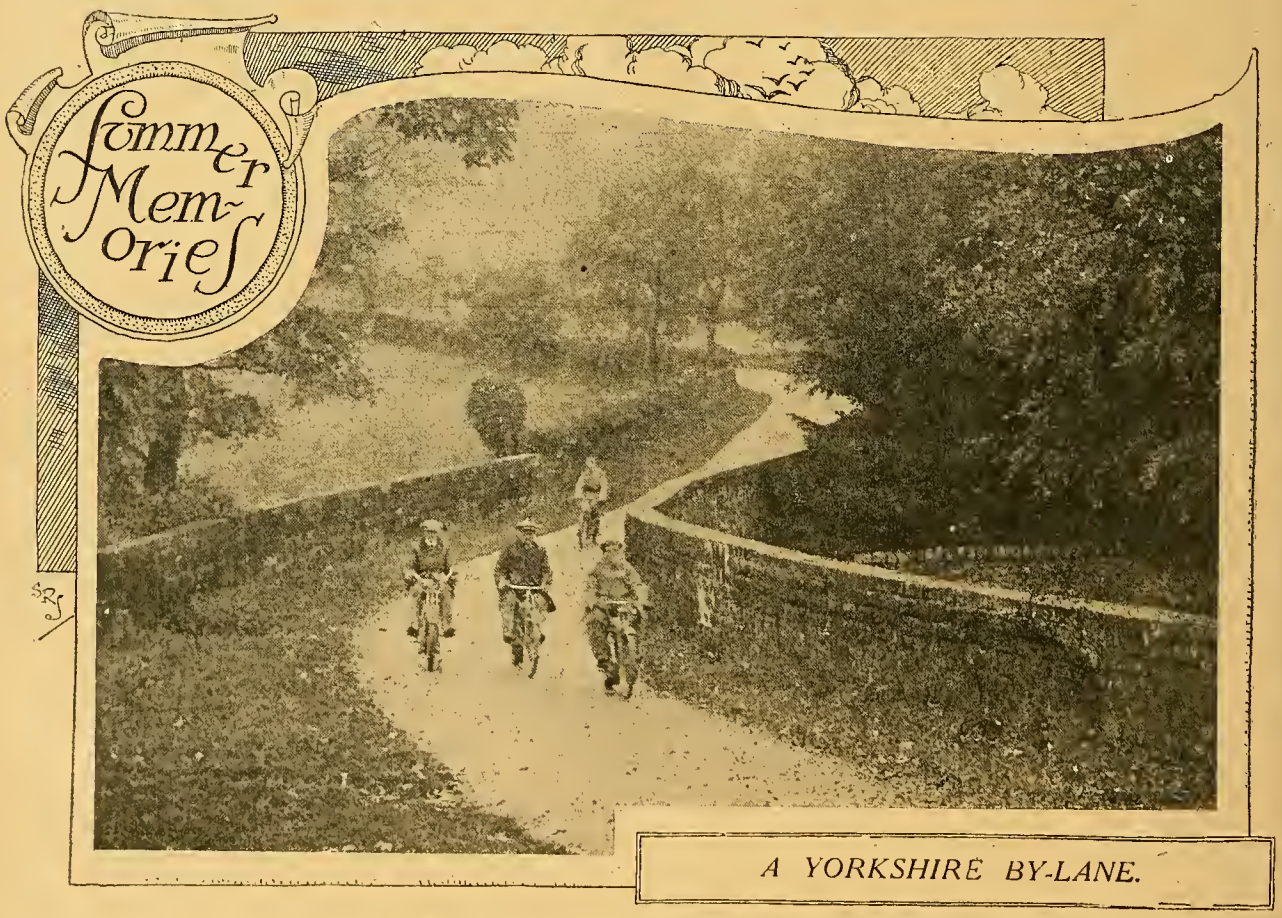
Leaving next morning, we made good time through Joigny to Sens, then the Forest of Fontainebleau, when we were brought to a halt in a large clearing with no less than seven roads joining, and had some difficulty in deciding on the correct one.

A swift run to Corbeil followed, and then, having taken a wrong road, we had to cross over the Seine and go up a wicked cobbly street, in which Billy had to tie his stand up, as jolting over the awful *pavé* had loosened the fastener. Proceeding through Juvisy, we came to Choisy, where the Eiffel Tower could easily be seen as we turned to the left and struck a good tarred road to Versailles. The roads here and to St. Germain beggar description, being composed of huge sets, with deep holes where several are missing. A community that tolerate such a road must be only half civilised. Three times before reaching our destination had I to mend punctures, seemingly due to the awful bumps breaking the canvas and then rubbing through the tube. At last we reached our stopping place for the night, the Hotel du Soleil d'Or, after a cool run of some 137 miles to Pontoise.

Friday, August 4th, was the next day, and saw us leaving for our last day's run on French soil. Through Meru to Beauvais, Grandvilliers, the road was composed of loose scraps of flint, as sharp as arrow heads. A car or two were passed with tyre trouble, whilst several times wrappings off new tyres could be seen by the roadside. I was not to escape, however, for three times had I to mend punctures. Passing Poix, a

To the Tyrol and Back on Motor Cycles.—

swift run to Abbeville, and more petrol at Montreuil, we eventually arrived at Boulogne, and made for the Grand Hotel du Nord, after a day's run of 136 miles.



Next day was spent at Boulogne, and we booked passages by the Bennett Line to Hull, as it was nearer home, and saved a tedious run up the Great North Road. We paid 10s. each for ourselves and only 3s. 6d. each for the machines. What a contrast to the Folkestone-Boulogne crossing!

Rain came on as we entered the Humber the following day, and was still with us as we landed at Hull at 4.30 p.m., after a pleasant passage of 18¾ hours.

We were allowed to keep the petrol in our tanks on board, and this sufficed to take us to the nearest garage, where we filled up for 2s. 4d. How trifling this sum seemed after what we had been paying.

Our tour had taken exactly four weeks, the distance covered being 2,250 miles per cyclometer. Our combined petrol bill was £5 1s. 6d., while I used three quarts of oil and Billy used four and one-third quarts. The ⅞in. Lyso I put on to start with carried me throughout, which, I think, speaks for itself. Grange used two, changing over now and again, one having been well used before starting.

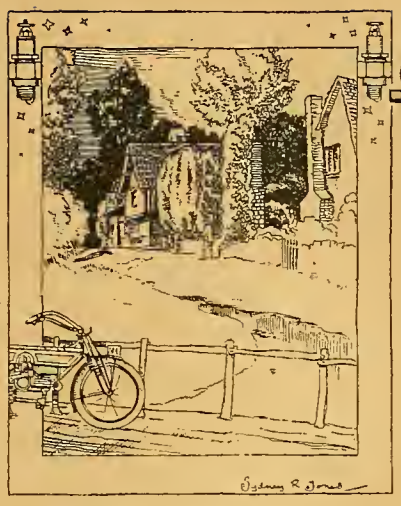
In conclusion, if any reader would like any further information as to roads, etc., I shall be pleased if he would communicate with me through the Editor

A YORKSHIRE BY-LANE.

THE NOMINAL HORSE-POWER OF MOTOR CYCLES.

IT will be seen by referring to our correspondence columns of last week that Mr. A. Citroen agrees with me that a motor cycle engine develops 1 h.p. for every 100 c.c. of its cubic capacity. If this be true then the horse-power can easily be found by referring to *The Motor Cycle* cubical capacity table and placing a decimal point after the first figure. This will give a very satisfactory rating, practically the same that the Dendy Marshall formula—which in my opinion is best suited to our purpose—gives if the revolutions be taken to be 1,570 per minute. This gives a speed of nearly 27 m.p.h. with a gear of 4½ to 1, and in the case of a lightweight geared 6 to 1 the pace would be nearly 21 m.p.h., which, I think it will be admitted, are fair average speeds.

The R.A.C. rating probably gives better results in the case of motor cycles than of cars, for the simple reason that there is not the same difference between the bore and stroke, the ratio seldom exceeding 3 to 2, whereas on cars it is sometimes nearer 3 to 1.



Mr. Poppe's formula has the merit of simplicity, but for our purpose must be ruled out of court, for it gives the Triumph engine as 4.67 h.p. and the Enfield lightweight as 5 h.p., which is obviously incorrect, the Dendy Marshall at 2,000 revs. per min. rating these engines as 6.36 h.p. and 4.37 h.p. respectively. Mr. Lanchester's formula is rather more flattering to the little twin, for it rates it as 4.47 h.p., and the big single as approximately 5 h.p.

AURIGA.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Tunbridge Wells to Barnstaple.

Please inform me the quickest route from Tunbridge Wells to Barnstaple; the mileage and the time it would take a 3½ h.p. machine?—WAITING.

Your best route would be as follows: Tunbridge Wells, East Grinstead, Crawley, Horsham, Billingshurst, Petworth, Midhurst, Petersfield, Winchester, Stockbridge, Salisbury, Hindon, Wincanton, Langport, Taunton, Wiveliscombe, Bampton, South Molton, to Barnstaple. The distance is approximately 210 miles. To do the journey comfortably you would require two days this time of the year.

Crankshaft or Countershaft.

I shall be glad if you will give me your opinion on the following two-speed gears for fitting on to a 1911 free-engine Triumph for solo work only: (1.) Bowden. (2.) N.S.U. The Triumph people advise N.S.U., but say it is liable to be broken if the machine falls on the left-hand side, a very possible contingency. Are they both easily attached?—R.D.C.

Either of the two-speed gears mentioned in your letter would suit your purpose—both are good. Naturally, the engine-shaft gear is liable to damage in the case of a sideslip, if the machine falls on its left side. Both gears mentioned are easily attached. See the article on "Variable Gear Position" in our issue for September 14th.

A Cheap Machine.

(1.) Please let me have your opinion concerning the general reliability, and also speed and hill-climbing capabilities of the 5½ h.p. Lincoln-Elk motor cycle? (2.) Also, how is it that this machine can be turned out at such a comparatively low price? (3.) Will you please also let me know the shortest route from Newport (Mon.) to Leighton Buzzard (Beds.) regardless of hills or condition of roads?—E.L.S.M.

(1.) We are receiving quite good reports concerning this machine. What you had better do is to write for readers' experiences enclosing a stamped and addressed envelope in which the replies may be sent to you? (2.) We are not prepared to answer why it can be produced at a low price, unless it be that the makers are content with only a small profit. (3.) The route you require is Newport, Chepstow, Gloucester (take the Cirencester Road and turn to left at the fork having passed the cross roads at the foot of Birdlip), Northleach, Witney, Oxford, Thame, Aylesbury, to Leighton Buzzard.

Portsmouth to Chatham and Ipswich.

Would you please inform me as to the best route from Portsmouth to Chatham, also from Portsmouth to Ipswich, avoiding London, and alternatively the best route through London, giving total distances?—W.P., R.N.

Your best route would be as follows: Portsmouth, Petersfield, Liphook, Godalming, Shalford; here turn right and go through Shere, Gomshall, Dorking, Reigate, Redhill, Oxted, Westerham, Riverhead, Wrotham; after which turn left for Rochester, whence you reach Chatham. Be exceedingly careful in Godalming, Shere, and Gomshall, and also in the ten-mile limit at Redhill—102 miles. This is the main road, but it is easy to avoid Godalming by turning sharp to the right at Milford, going past Milford Station, and taking the left at the cross roads about a quarter of a mile further on. This road will take you to Shalford. Portsmouth to Ipswich: You can follow the same route until after leaving Wrotham, where make for Gravesend; take the ferry to Tilbury, and go north *via* Billericay, Chelmsford, and Colchester to Ipswich. To go *via* London, which, in our opinion, would be undesirable from a motor cyclist's point of view, you had better go straight up the Portsmouth Road, through Kingston, where be careful on account of police traps, and reaching Putney Heath go through Roehampton, across Barnes Common to Hammersmith. Go straight down Hammersmith Road, down Holland Road, crossing over the bridge close to Olympia, which will lead you into Notting Hill Gate. Go up Notting Hill and straight on to Lancaster Gate, where turn off for Oxford and Cambridge Terrace; go straight down Oxford and Cambridge Terrace, crossing over Edgware Road, turn to the left down Lisson Grove and go straight on over the railway bridge until you come to a place where the road bends round easily to the right. At the end of this turn left and you are in Finchley Road. Go straight on along the Great North Road through Hatfield. Beyond the station turn right and go through Hertford, Ware, Bishops Stortford, Dunmow, Braintree, Colchester, and Ipswich. The total distance would be approximately (*via* Gravesend) 160 miles. In giving this route, we have considered road surface, etc. The main route *via* Romford, Brentwood, and Chelmsford is very unpleasant near London, but is twenty miles shorter.

High and Low Tension Magnetos.

(1.) I shall be obliged to you if you will kindly explain clearly the difference between high-tension and low-tension magnetos. (2.) Being in possesion of a low-tension magneto I wish to know how I can convert it into a high-tension magneto?—J.S.J.

(1.) If you will get a copy of "Motor Cycles and How to Manage Them" obtainable from these offices, price 1s. 2d. post free), you will see the two types of magneto clearly described. In the high-tension magneto the primary and secondary windings are both on the armature, and a spark is produced at the plug without other help. The old type low-tension magneto had a make and break in the cylinder. Another type produces a low-tension current which is transformed by the use of a separate induction coil. (2.) It is practically impossible to convert a low-tension into a high-tension magneto. It would mean a new armature, and a special contact breaker, and condenser, and it would in the end cost a good deal more than buying a second-hand high-tension magneto.

Sidecar for India.

(1.) Please let me have your latest experiences with regard to the T.M.C., as I am thinking of buying one while at home, and then taking it out to India? If it is liable to overheat, I rather doubt if it would be much use for the work I want it for, *i.e.*, shooting trips—carrying gear possibly in a sidecar—over pretty rough roads. (2.) Also any experiences with the Scott two-stroke would be useful—L.L.M.

(1.) The machine about which you refer to in your letter has been entirely reconstructed and redesigned for 1912, and the first batch will be placed on the road about April. The machine is now water-cooled and shows every indication of being a splendid machine for sidecar work. It is, however, impossible to give practical road experiences at the present time. (2.) With regard to the two-stroke machine mentioned, we have had considerable experience with this, and may tell you that our opinion of it is high. What we should advise you to do is to write us a letter asking for readers' experiences of both machines referred to, enclosing a stamped and addressed envelope for replies.

Easy Starting and Slow Running.

Please advise me what is the best thing to do with a 3½ h.p. single-cylinder magneto machine quite modern. I have trouble starting unless engine is warm, and cannot drive very slowly through towns, etc. I do not want to spend much. Could I have a clutch fixed? Two speeds would cost too much I am afraid.—T.R.S.

You might take the magneto down and clean the slip ring and the contact breaker and touch up the platinum points. Use a good plug and adjust the points with a magneto plug gauge which is ½ millimetre thick. Take care to exclude most of the air from the fixed air supply to the carburetter at starting, and we think the engine will fire without much difficulty. You could have a clutch fixed to the engine-shaft if you desire it.

Taxation and Registration.

Acting on your advice I have paid the tax for 1910 on the motor bicycle sold by me in that year, but as I omitted to cancel the registration (not knowing it was necessary) the City of Dublin registrar maintains that I am liable to pay the tax on that machine for the years 1911 and 1912. Also he states that the tax is due whether the machine is used or not. Please advise me further.—S.H.L.

We do not think that you are liable for the tax for the two years during which you neither owned nor rode the machine. A machine which is kept but not used is not liable to licence duty; see the case L.C.C. v. Fairbank, Justice of Peace Reports, Vol. 75, page 356. We think you would be well advised to bring the matter to the notice of the legal adviser of the Irish Automobile Club, if you have not already done so. You ought, however, to have cancelled the registration of the machine you sold. Article IV. of the Regulation and Licensing Order, 1903 says, "If the ownership of a motor car (or cycle) is changed, notice of the change shall be given either by the new or old owner to the council with whom the motor car (or cycle) is registered, and an application shall also be made either to cancel the registration or to continue the existing registration under the new ownership."

Four Cylinders.

I want to get a second-hand motor cycle about £25 to £30. I have had an old 3½ h.p. four-cylinder F.N., but found that steep hills were too much for it. (1.) Do you consider a later model 5-6 h.p. for the price mentioned would be a good one and take all hills with automatic carburetter? I do not mind the slight extra bother of four cylinders and hate the idea of having a belt to look after. (2.) The 2¼ h.p. two-speed F.N. What sort of machine is it, and would it be suitable for week-end touring? (3.) Theoretically, is it more economical to run on an open throttle and small jet or ordinary jet and partly closed throttle? I wonder whether a B.B. variable jet carburetter would be more economical than the automatic one on the four-cylinder F.N. if run on quite a small jet for ordinary flat roads with ample reserve opening for hills. (4.) Theoretically, which should be the more easily slowed down, a big single-cylinder or four small ones of same total power? (5.) Do you advise going to a dealer or private man?—J.F.G.B.

(1.) The machine in question will be good value for the price asked for it, and the 5-6 h.p. is a great improvement on the old 3½ h.p. (2.) The 2¼ h.p. referred to is well-made, quite reliable, and suitable for the purpose mentioned. (3.) It ought to be more economical with a small jet than with a large one. You could not get quite the same economy with a larger jet even if you ran with the engine throttled down. There seems to be little doubt that you could get better economy with the carburetter fitted with hand-controlled air, but the firm's own automatic type is better for all-round work. (4.) Theoretically, the four-cylinder would be more easily slowed, as the instant the power is withdrawn, say by switching off or raising the exhaust valve, the increased internal friction quickly slows down the speed. Also, the four-cylinder can be run very slowly. (5.) Good bargains may be obtained from either.

Harrogate to Leominster.

I purpose making a journey to Leominster from Harrogate, and should be greatly obliged if you would advise me as to the best route for surface? I have previously been as far as Crewe, *via* Huddersfield, Ashton-under-Lyne, and Stockport; this route I am anxious to improve upon owing to the many miles of large paved sets in the neighbourhood of the two last named places, as I shall have a sidecar and passenger.—F.G.

Your best route would be as follows: Harrogate, Wetherby, Aberford, Ferrybridge, Doncaster, Retford, Tuxford, Newark, Grantham, Colsterworth, Stamford, Kettering, Northampton, Weedon, Daventry, Southam, Warwick, Stratford-on-Avon, Alcester, Worcester, Bromyard, to Leominster. This is, of course, a fairly long way round, but you miss all the big towns, and have a good surface.

READER'S REPLY.

Multi-pole Sparking Plugs.

I think if your correspondent "T.W.," whose enquiry was published on January 18th, would fit plugs with longer reach, he would be able to start easier. I have done so with advantage in my Douglas machine.—ROBERT RANGER.

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"Reader." (Sunderland). Mabon change-speed pulley and clutch with 3½ h.p. sidecar.

"H.V." (Tufnell Park). 3½ h.p. 1912 Corah-Jap roadster and T.T. models. Senspray carburetter, reliability and power.

"C.R.T." (Birkenhead). X'LAll saddle.

"W.S." (Lancaster). 2¼ h.p. Lincoln-Elk.

"J.M.S." (Kendal). 5 h.p. T.T. Bat or Matchless with Amac carburetter, particularly with regard to slow running and fast hill-climbing.

'A.J.S." (Billericay). 3½ h.p. Bradbury clutch model.

"P.J.B." (Dublin). Atlas puncture-proof inner case.

"H.T." (Catterick).—2¾ h.p. Douglas two speed and free engine.

"A.V.G." (Hyde Park, W.)—5-6 h.p. Clyno and 8 h.p. Matchless with and without sidecar.

"B.W.D." (Emsworth, Hants).—2½ h.p. A.J.S. and 2¾ h.p. Douglas, two-speeds.

"W.G.G." (Islington). Canoelet sidecar with 3½ h.p. motor cycle.

WINTER SPORTS IN GERMANY.

The above photograph, which was taken recently in Grunewald, near Berlin, depicts a boy on ski being towed through the streets by a motor cyclist. This is a common yet exciting form of amusement.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Daventry to Southwold.

Sir,—With regard to "A.J.M.'s" projected ride to Southwold (January 18th, page 78), may I suggest as preferable an alternative route from Bury onwards, namely, to follow the road which goes about N.E. through Ixworth to Scole, then to Harleston—which he need not go through—then through Metfield to Halesworth, and thence to Southwold. The distance this way is about forty-eight miles, as opposed to fifty the other, and the roads are certainly preferable, for I have been both ways, the one I propose several times. From Harleston to Halesworth the road is much better than it looks, and I have known it to be the best bit between Cambridge and Halesworth, except for the thirteen miles from Cambridge to Newmarket. The road from Halesworth to Southwold is better than from Blythburgh to Southwold.

NORMAN K. ROSCOE.

The Evolution of Transmission.

Sir,—Dr. C. S. Patterson, in his letter to you of Jan. 18th, page 75, asks: "What about the big end of the connecting rod going?" and I ask: Well, what about it? Is that to be compared with a seized piston? I should say, certainly not. He then quotes something that happened on a chain-driven car. Surely that has no bearing on the matter. I, personally, have had all manner of things get into the chains of a car (even a rabbit), the worst being a lump of wood which the steel-studded tyre picked up; but it did not throw me over the steering wheel, etc., but doubled up the radius rod. It would be interesting to know what kind of chains he was using to stop "dead" the weight of a car without being broken; also the size of the stone, and whether he had a differential fitted to the car. Statements of this sort do not help a movement, but make one suspicious that the writer has an axe to grind. My experience, extending over thirteen years, is the reverse.

F.R.H.

Passenger Machine Design.

Sir,—With regard to the correspondence which has been published in your paper respecting passenger motor cycles, I have patented a vehicle embodying the following points:

(1) No chains; (2) no belts; (3) no forks; (4) no bevel pinions; (5) no working or greasy parts near occupants; (6) two-speed gear (teeth always in mesh); (7) detachable quick-change wheels; (8) interchangeable wheels: (9) two tracks; (10) tubular oval steel, wire, or artillery pattern spokes applicable; (11) hand wheel steering; (12) specially suitable for lady drivers; (13) each wheel independently sprung (similar to car practice); (14) engine, driving gear, and all working parts accessible; (15) double-acting band brake; (16) can be safely ridden solo; (17) free engine (handle starting); (18) the steering road wheel with its spring and bracket member are quickly detachable for storage or transit.

This machine is in course of construction, and I hope to send you an illustration for publication very shortly.

WM. STARLEY.

Sir,—No doubt the origin of the sidecar was owing to the fact that motor cyclists, finding the trailer too dangerous, and still desiring to take a companion when they wished, looked about for another form of attachment to this end, and gave the sidecar a trial, only to find that on any but a moderate gradient heavy pedalling assistance was required with the engines then fitted to their machines, and hence the increased demand for more powerful twins of 5 to 6 h.p. and two-speed gears, for, though it has been shown that in the hands of an expert the modern, so-called, 3½ h.p. engine, which, according to some authorities develops from 7 to 8 h.p. on the brake, can do wonders, still, even in the hands of such an expert, it is no doubt true that a 5 or 6 h.p. twin fitted with a two-speed gear would have been a more handy and convenient combination, and, in average hands and to meet every contingency, a well-known 8 h.p. and three-speed gear would be better still.

But the weight of a 5-6 or 8 h.p. motor cycle is too great to make it appeal as a solo mount to any but the youngest and most vigorous, and certainly not to the middle-aged, who, as yet, are only contemplating taking up the sport, though, when combined with a sidecar and handle or kick-starting, the weight ceases to be a disadvantage. If that is conceded, why make the sidecar detachable? Why not build it as a unit, as there must be very many who are not obliged to attach and detach the sidecar, in order to get it through narrow doorways, each time they use it.

If, then, this is admitted as good practice, it would no longer be necessary to adhere to the present design of frame—one much better adapted to withstand the strains imposed could be evolved, and the comfort of the driver increased by a well upholstered bucket seat and good footboards; and further, following car and quadcar practice, both front and back forks could be abolished, and "outside" wheels used instead. Just fancy the comfort of being able to change both inner tubes or covers in a few minutes without having to take the wheels out of the forks or disarrange brakes or anything else, and further there would no longer be any necessity to continue the diamond frame of the cycle—a dropped frame could be employed.

If, then, the two-track passenger machine with three wheels and motor cycle licence is to obtain, my proposal is that the back axle should carry both wheels, in the cheaper form one only to drive, but a "differential" could be used, the steering wheel being similar to that on a car or tricar, dropped frame, bucket seat for driver as well as passenger, 8 h.p. engine, and three-speed gear. What do your readers say?

E.J.S.

Do Records Appeal to Buyers?

Sir,—I quite agree with "Yorkshire" that records do not appeal to the majority of buyers, but only to the sporting class of motor cyclist, who want a machine to pass every other make on the road. In my opinion records do not prove the value of the machine half so much as long distance trials officially run.

If the public could see some of our crack machines after continual use on Brooklands without being overhauled or cleaned they would notice that ninety-nine out of one hundred engines were covered in oil, while probably some of them would have badly worn bearings, and burnt piston rings and valves.

In the record breaking season stacks of spare parts are sent to Brooklands, thus showing the public that, although one make of machine may hold several records, this fact proves nothing regarding the reliability and wearing qualities of this machine.

Brooklands, of course, is ideal for experimental work, as continuous high-speed work has to be indulged in to find out any weak spots in the engine; which continuous high-speed cannot possibly be attained on public roads.

For a machine to hold speed records simply proves that this machine is the fastest and nothing else. At the end of a record ride, for all the public know, the engine may be at its last gasp.

In order to prove which is the best engine for all round work, I would suggest that long distance trials should be held on Brooklands, such trials to include long distance speed

tests, slow tests, acceleration tests, finishing up the high-speed test with a slow climb up the test hill. All involuntary stops, repairs, adjustments, overhauls, amount of wear in engine, amount of carbon deposit, amount of oil exuding from engine, state of tyres and belts, and general condition of machine to be taken into consideration and recorded in the official results.

I do not think many manufacturers would risk a trial of this severe nature. DISSATISFIED.

Multi-pole Sparking Plugs.

Sir,—I have been much interested and at the same time rather amused at the correspondence that has been appearing under this heading, and, as a satisfied user of the Lodge double-pole plug, a word from me may prove useful on the subject.

I have been using these plugs on my 8 h.p. Chater-Lea twin and sidecar since the beginning of last season, and so far, in spite of dire warnings as to damage to the armature-winding of the Bosch magneto, I have had no trouble at all. The double-pole plugs are fitted over the inlet valves and the ordinary plugs over the exhaust valves. I find that the result of using the Lodge plugs is a cooler engine and a decided increase in power, which is particularly noticeable when hill-climbing. It is most important that the double-pole plugs should be fitted over the inlet valves, as the incoming gas tends to keep them cool, and care should be taken in the choice of plugs for fitting over the exhaust valves owing to heat in that position, but I have found that any really good magneto plug will stand up in spite of the heat.

I quite agree with your correspondent Mr. E. F. Baxter as to it being difficult to start up a big twin on the double-pole plugs, as I found the same trouble myself, but I overcame that by cutting out the ordinary plugs, by means of a small switch fitted to each of the ordinary plugs, and switching over to the double-pole plugs and the ordinary plugs coupled together after the engine had started.

Since reading this correspondence, I have taken the double-pole plugs out of the engine and have run only upon the ordinary plugs, and I can detect no missing or weak sparking at all, so that I fail to see that there is anything wrong with the armature winding. The interest taken generally in this subject must be the excuse for the length of this letter. R. CREAK DAVIES.

Experiences of the R.I.C.

Sir,—I was much amused at Mr. Trigg's description in your issue of January 11th, of his encounter with an officious constable.

We in Ireland seem to be blessed with a more sporting breed of "bobby"—at any rate so far as I have come in contact with him.

For instance, some time ago I was motor cycling through Balbriggan at night when a member of the R.I.C. stopped me and asked for my licence because I had no light. Now I knew my light had been burning brightly just as I entered the village, but, owing to the glare from the lights I had not noticed it go out. I explained this to the constable. He replied that that was the usual excuse. I invited him to feel the lamp. He did so, and it was so hot that it burnt him rather badly. I thought, "Now I'm certain of a summons," but, though he must have been suffering intense pain, he said, "You had better light up again. It would not be fair for me to have you up as the lamp has evidently just gone out."

Another example: Some months since I was warned by a friend that the Metropolitan Police were working a trap on a certain road in the suburbs of Dublin.

One day I was riding along that particular road at eighteen miles per hour, when I was called on to stop and informed that I was riding at between twenty-three and twenty-four miles per hour. I pointed to the maximum hand of my speedometer—a Jones, in the second 10 000 miles—which stood at twenty-one miles, and told the sergeant in charge of the trap that there must be an error as the twenty-one was done on another road, and I had not exceeded eighteen there.

He said the speedometer was wrong. I replied I was certain it was working correctly.

After thinking a moment he said he would soon prove it. He pointed out the beginning and ending of the trap, and told me to run through it at some exact speed. I said, "But suppose you say I'm going twenty-five and the speedometer says twenty, you will have me for two offences."

"Oh no!" he laughed, "you select any speed you like, and I give you my word that if your speedometer agrees with my watch you shall not be summoned." I took him at his word and ran through that trap, which was 220 yards in length, in exactly fifteen seconds.

When he came up to me he said "thirty." I pointed silently to the maximum hand which rested exactly on thirty.

He kept his word, and I heard no more about the affair.

I have heard, also, that the Dublin Metropolitan Police detest being put on to trap motorists. PAT.

Experiences in Southern Nigeria.

Sir,—I have read the different experiences of your readers, so I thought I would send along mine, and enclose photograph of myself and chum here in Lagos.

I bought this Rudge-Whitworth machine and Millford sidecar while in England last June, and rode it at home for three months, covering close on 3,000 miles. I was an absolute novice and did not know the first thing about motor cycles. I had about ten minutes' tuition and started off. I weigh 16 stones and my chum 14½ stones, or close on 4 cwts. between us. I have studied your paper, and have found a lot of useful tips in it, and am thankful I started to take it weekly, and get the same forwarded every mail from home.

We have about twenty miles of road here in Lagos that are fairly decent for motor cycling, and it is a splendid

The writer of the accompanying letter and his friend with a Rudge and sidecar in Southern Nigeria.

pastime during the cool of the evening or early morning. Up in the interior, or about 120 miles from here, there is a good road for about sixty miles, and as the country is opening up rapidly, there is a good future for any maker who cares to start an agency in Lagos, with a good man to do repairs, as there are scores of wealthy natives who would immediately buy motor cycles, sidecars, and runabouts if they could rely upon getting them repaired.

Wishing your paper continued success, W. SMITH.
Lagos, S. Nigeria.

How to Exhibit a Badge.

Sir,—I have been a motor cyclist member of the A.A. for some years, and have almost invariably had my badge attached to the top of the lamp, as shown in your illustration last week.

Could not the manufacturers be persuaded to make the necessary clips a standard part of their lamps? The A.A. is a great boon to the motorist, being practically the only institution to help the motorist when he is on the road. I often wonder why the R.A.C. does not associate itself with it in a more marked fashion. A. J. ATKINGS.

Some Experiments with Hydrogen-peroxide.

Sir,—I believe that I am right in assuming that acetylene burners are so constructed as to admit of air being introduced and mixed with the jet of gas to assist in the illuminating power of the flame. I notice your contributor touches this point. I would be interested to know what type of burner was used in the experiments. If some burners inject more air into the gas than others (the amount of gas passed through each burner per hour being the same), then apparently the candle-power will vary accordingly. Perhaps Mr. Renfred Myhill will kindly enlighten us. O 5298.

The Stream-line Body on Racing Motor Cycles.

Sir,—The article and illustrations regarding stream-line form, appearing in *The Motor Cycle* of January 18th, greatly interested me, as I am a keen motor cyclist, and, needless to add, I shall look forward to the fulfilment of Harry Bashall's promise in last week's issue. He proposes to experiment on these lines during the year. If I may quote his letter, he says he is certain that it will increase existing speed records.

Now, if Collier can do 91 miles an hour on Brooklands track, I predict that days only separate the time when, fitted with an efficient stream-line form body, a similar machine will easily be capable of over 100 miles an hour.

Those who, like myself, take an interest in the "higher form of locomotion"—aviation—and had the good fortune to see the thrilling flying by Weymann in his Nieuport at the never-to-be-forgotten Gordon-Bennett aviation races at Eastchurch last July, will not require to think this out.

It is not so very long ago since the Nieuport monoplane, with only a 28 h.p. engine, was making much faster times than several other well-known makes fitted with 50 h.p. engines, and in some cases even more powerful than these. Why was this? Because of the efficient stream-line form body of the Nieuport, and all head resistance reduced to a minimum.

There can be no doubt about this being an all-important factor regarding speed, and one of which we are likely to hear considerably more at no distant date.

RICARDO E 1407.

The Proposed Abolition of the Cut-out.

Sir,—Though an old motor cyclist, I think it high time something was done to stop what is an intolerable nuisance. I reside on the outskirts of a fairly large town, and there is a good deal of motor traffic passing. There are certain motor cyclists who think it the correct thing to race up and down the road, chiefly on Sundays, with their cut-outs open, kicking up an infernal row. Only a Sunday or so ago, on my way to church, two such young "bounders" passed. Little did they know that at three of the houses they passed, friends were lying dangerously ill, two of whom have since passed away. Once during the summer I was awakened at 4 a.m. by the noise caused by some youths testing their engines, who passed and repassed my house three times within an hour.

I am not finding fault with the cut-out, by any means—that is all right, and a very useful friend—it is the improper use that is made of it. Some of your correspondents find fault with the steam roller; surely that is rather weak, especially when one frequently reads complaints in your paper of unrolled road surfaces. Then again, the traction engine; how many does one pass in a day's run? I ride all days of the week but one, and can only call to mind passing three during the past year, and they were being used for business purposes, to the good of the community. Besides, traction engines rarely, if ever, move at night, and it is the vibration they cause that renders them a nuisance, not the noise. If motor cyclists would remember to shut their cut-outs through villages and towns, there would be no talk of legislation. No, it is the irresponsible minority, who apparently think of no one but themselves, that will be responsible for any alteration in the existing law, and the sooner they realise the fact the better.

REX.

Sir,—Mr. A. H. Priestley's grounds for disputing my statement on silencers appear to me to be very slight, and he cannot dispute the fact that the 1912 silencer as fitted to half-a-dozen of the best makes which were existing in 1906 is practically identical with the one supplied to those machines at that date. Certainly over 90% of the machines one meets in this district (Oxford) are driven with cut-outs open, and in this condition a machine even slightly out of tune makes itself particularly objectionable. I quite admit that a few makers have been experimenting, much to their credit, with long exhaust pipes, etc., but really without much effect except added complication and unsightliness. I am sure a silencer on present lines could be made by increasing or doubling the size and fitting an exhaust pipe of 1½in. diameter in place of the 1in. or 1¼in., but what is very important is that this should be fitted with brazed-on radiating fins. Then indeed could one claim that the cooling assisted the exhaust discharge. A.H.P.

How to Keep Warm.

Sir,—Last summer I wore a long Umpire dust coat on my shorter journeys. I found it kept me clean from head to heel, or very nearly, as the skirts wrapped well round my shins.

As the weather changed, I had a shower-proof Gabardine coat built on the same lines, but double-breasted inside, although it looked single-breasted outside. As the cold increased I had a light chrome leather panel sewn inside the coat, reaching well below the waist. This kept the wind away from chest and abdomen. The latter I consider the most vulnerable part of a motor cyclist's anatomy.

As this coat has a Bismarck collar and fits smartly round the neck there is no need, and indeed no room, for a neck wrap, but feeling the need of more warmth I just folded my Scotch muffler in half and fixed it in place with a big safety pin just below the top button, and the ends reach below the waist.

Thus I have a warm, light, rain and windproof coat, long enough for the protection of my legs, and rendering overalls unnecessary for short journeys such as running down to business and back to lunch, and I can put it on and off in a very short time indeed. MO-CLO-CLO.

Hill-climbing.

Sir,—When touring the Lake District last July with a 3½ h.p. two-speed Bradbury and sidecar, I climbed the Buttermere Hause Pass from the village of Buttermere through Newlands into Keswick.

Only on one small portion did my passenger alight, and that not so much to relieve weight, but she was nervous of the jolt from a bad watercourse which appeared in front. The previous ones jolted us both nearly off our seats. The whole of this route was performed by engine power, and it was not necessary to push the machine one yard.

Another trip performed on the same tour was from Ambleside to the top of Kirkstone Pass *viâ* Troutbeck Bridge. This is a seven-mile constant climb, and certainly steeper with several worse bends than the more usual road from Windermere.

Only on one small portion of this did my passenger alight. In taking a bad bend on a steep rise I slowed down too much and the machine stopped. We pushed the machine a matter of a few yards, mounted and finished the remainder without any trouble whatever. July last year was a trifle warm, and although the engine got smoking hot it kept plugging away. FREDERICK T. TURPIN.

SUMMARY OF CORRESPONDENCE.

Will the person who wrote to the Lomax Tyre Co., from Gosport, send his name and address, as he omitted both from his letter of the 24th ult.?

C. E. Holmes writes to explain that the observer was wrong in crediting him with a stop on Pink Hill. The facts are that, nearing the top, a horse and cart baulked his progress, and, after stopping to let the driver pass, the Chater-Lea restarted and finished the climb with ease.

CURRENT CHAT

TIME TO LIGHT LAMPS.

Feb.	1st	... ...	5.45 p.m.
,,	3rd	... ...	5.48 ,,
,,	5th	... ...	5.52 ,,
,,	7th	... ...	5.56 ,,

Police Trap.

We are advised of a continual trap being worked in the Richmond Road, at the south-west end of Mortlake.

Club for Kidderminster.

A meeting will be held on the 7th inst., at the Black Horse Hotel, at 7.30 p.m., for the purpose of forming a club for Kidderminster and district.

Sidecar v. Tram.

Owing to the unsuitability of train service from London to Wales on Sunday night, we understand that one of the London daily sporting papers despatches its Monday edition per sidecar.

M.C.C. London-Edinburgh Run.

The M.C.C. Committee has decided to award two silver cups in the London-Edinburgh run—one for the best performance by a competitor on a motor bicycle and sidecar and one for runabouts with three or four wheels. Mr. S. H. Fry will present one of the cups.

Experiments with Hydrogen Peroxide.

We have tried the proportion of one ounce to a pint of "20 volumes" hydrogen peroxide in a lamp generator, and can confirm the statement made in the article published last week that the addition makes an improvement to the light. Just how much better the illuminating power becomes we could not definitely say, but the distance the light penetrated was further than usual. Unfortunately for the result of the experiment the moon was shining brightly; doubtless on a dark night the increase in penetration would be more noticeable.

Championship Hill-climb in N.S.W.

The Motor Cycle Club of N.S.W. held a most successful hill-climb at Baden Hill, Coogee, on December 9th, 1911. There were three classes and excellent sport was witnessed. The fastest time of the day was made by A. Biden (5 h.p. Matchless), 24⅘s., while W. Tormey made a record for a single cylinder, 25⅖s., on his T.T. Speedwell-Abingdon. The competition was on the knock-out principle. Results:

Class I. (Touring machines, 500 c.c.).—Final, K. Bennett (Speedwell-Abingdon) beat S. Binns (Triumph).

Class II. (T.T. machine, 500 c.c.).—Final, R. Robinson (Speedwell-Abingdon) beat W. Tormey whose belt came off.

Class III. (Open class, all powers).—Final, A. Biden beat A. A. Searl (5 h.p. [illegible] Jap).

The Surrey Police.

In connection with the Godalming speed limit and persecution of motorists, it is interesting to note that the R.A.C. and West Surrey A.C. offered to co-operate with the police in their endeavour to put a stop to the reckless driving of a few by posting observers in suitable places.

FUTURE EVENTS

Feb. 17.—Sutton Coldfield A.C. Open One Day Trial.
Mar. 2.—A.C.U. Open One Day Trial.
,, 22.—B.M.C.R.C. Race Meeting.
,, 23—Herts. County A.C. Open Quarterly Trial.
,, 30.—Derby and District M.C.C. Open Hill-climb.
Apl. 5-8.—N.W. London and Herts. County M.C.C. Joint Trial and Open Hill-climb (Yorks.) and Ladies' Competition.
,, 8.—Westmorland M.C.C. Open Hill-climb on Brigsteer Brow
,, 13.—Oxford M.C.C. Open Hill-climb

The police, however, refused this offer on the ground that the presence of the A.A. patrols on the road would render such efforts of no effect. Do the Surrey police really wish to stop dangerous driving, or are they out to get fines?

SPECIAL FEATURES.

WAR OFFICE TEST AT BROOKLANDS.
TWO-STROKE ENGINES.
TOOLS AND SPARES.

Noted Hill Climbed.

Caves Hill, a notorious climb near Sydney, N.S.W., rising 1,700 feet in 2½ miles of zigzag road, has recently been climbed on motor cycles for the first time, L. J. Astley (3½ h.p. Rudge) and R. W. Allen, late of Halifax, Yorkshire (Zenith-Gradua), performing the difficult feat.

The B.M.C.R.C.—A Successful Year.

We are in receipt of the third annual report of the enterprising British Motor Cycle Racing Club. The past year has been a most successful one, and the club's accounts show a substantial credit balance. The report is a concise record of an active year's work. It will be the policy of the club, we learn, during the coming season still further to encourage racing, and to offer special inducement to less experienced members to make attempts on record. With every report two complete lists of British records up to January 1st have been sent, on the back of which are full particulars of membership.

WAR OFFICE TEST AT BROOKLANDS.

Major Stevenson, D.S.O., starts P. Shaw (P. and M.) at the foot of the test hill.

"The Beehive Thing that Makes the Noise."

Some of our "learned friends" of the Bar may know a lot about law, but when it comes to motor matters they are often hopelessly ignorant. In a recent case one of them referred to the engine as "the beehive thing that makes the noise."

Benevolent Fund Concert.

The Birmingham Centre of the Cycle and Motor Trades Benevolent Fund will hold its third annual Bohemian concert in the Grosvenor Room, Grand Hotel, Birmingham, on Tuesday next, the 6th inst. Tickets, 1s. each, may be obtained from the hon. secretary, Mr. A. B. Williams, 13, Weaman Street.

A New German Organisation.

A German body called the Allgemeine Deutsche Automobil Club was originally formed to foster the motor cycle pastime and industry, but subsequently became interested in small light cars and motor boats. Now a fresh body has arisen, the Berlin branch of the above association (with thirty members) having pledged itself to do its utmost to promote the sport of motor cycling. Should other branches of the same organisation follow suit, a new association may arise Phœnix like from the ashes of the old one.

Gradient of Stoney Brow.

Our local correspondent has interviewed the city surveyor of Manchester regarding the gradient of Stoney Brow, the hill depicted in the photograph on page 79, January 18th, showing a Dot sidecar climbing the Brow. The city surveyor says the gradient of Junction Street, Store Street, Manchester, otherwise known as Stoney Brow, is 1 in 6-19, taken from a point in the centre of the carriage-way opposite to the building line in Store Street, and terminating at the top of the slope of the Canal Bridge. Our original statement of 1 in 7 in the inscription under the picture, is therefore practically correct. The average gradient is 1 in 7, and the worst portion as depicted 1 in 6¼.

Clean Counties.

Cambridge was cited as a "Clean" county in a recent issue of *The Motor Cycle*. A correspondent, however, informs us that not so very long ago a trap was vigorously worked at Trumpington and between Trumpington and the University town. It would be interesting to know if this control was worked at all during 1911. Perhaps a Cambridge reader will let us have this information.

Auto Cycle Union Notes.

ONE-DAY TRIALS.—The regulations for the above, the first of which takes place on March 2nd, have been approved by the General Committee. Silver medals will be awarded to those private owners who gain first-class certificates. A summary of the conditions appears on page 125.

MEMBERSHIP.—Fifty-two members were elected at the last A.C.U. committee meeting.

AFFILIATION.—The Wigan M.C.C. has been affiliated to the governing body.

ANNUAL GENERAL MEETING.—The annual general meeting of the private members will take place at 8 p.m. on March 7th, and the annual general meeting of the Council on Saturday, March 30th, at 3 p.m. Both meetings will be held at 89 Pall Mall, S.W.

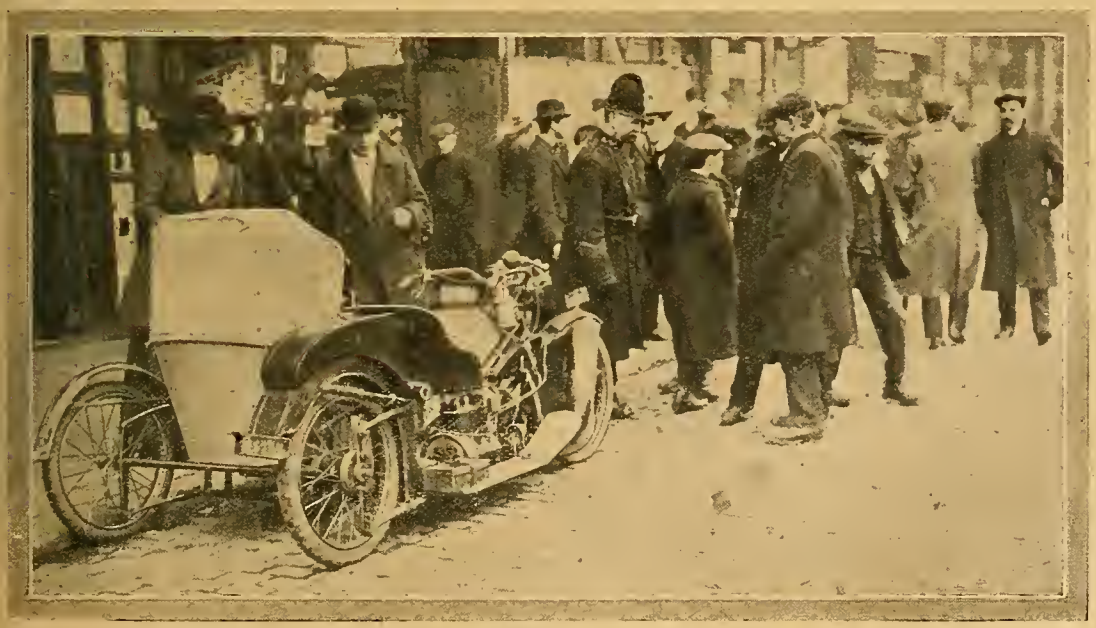
THE MOTOR CYCLE UNION OF IRELAND.—The Auto Cycle Union has decided to enter into an agreement with the Motor Cycle Union of Ireland to recognise suspensions, etc., imposed by that body.

OFFICIAL TIMEKEEPER.—Major F. Lindsay Lloyd, R.E., has been re-appointed official timekeeper for the electric chronograph at Brooklands.

OPEN RELIABILITY TRIAL.—The Birmingham M.C.C. recently applied for a permit for an open reliability trial from Birmingham to Perth on April 6th, and from Perth to Birmingham on April 8th. It was agreed that two permits should be granted, provided that each day's run were a separate event, with separate rules, awards, and programmes. Two separate permit fees were to be paid, and each event to be kept distinct.

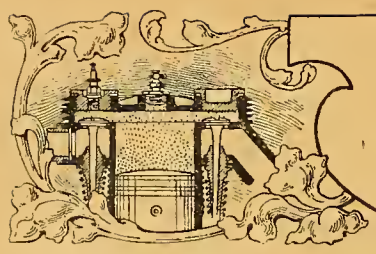
The Dutch Trial.

Another prominent motor cyclist has entered for the English-Dutch reliability trial in the person of F. A. Applebee, who will ride a 3¾ h.p. Scott and sidecar in the trade team if chosen. H. H. Anson (Selby) has entered his 5 h.p. Matchless in the amateur section. The matter of choosing a representative team becomes more difficult every week. If any reader has in mind a good method of choosing the British team, apart from an eliminating trial, we shall be glad to consider it.



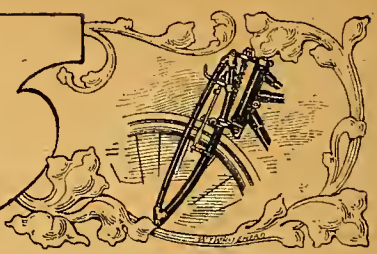
American Road Race.

A road race across what was once known as "the Great American Desert," from Phœnix (Arizona) to Mesa and back, took place on the 28th ult. The distance is thirty-eight miles, and the roads are very sandy all through the State of Arizona. The winner's time under the circumstances, 1h. 0m. 37s., is considered in the States to be a good performance. Ten riders competed, and the winner rode a single-cylinder Harley-Davidson. The second man rode a Thor.



This Year's T.T. Races.

The Tynwald Court, Isle of Man, at its sitting last week, decided to grant permission to the Auto Cycle Union to hold the Tourist Trophy Races this year, provided proper regulations are made to prevent competitors and others becoming a nuisance to other people. The Tynwald authorises the races on condition that efficient silencers are used, and recommends the adoption of the old course—St. John's, Kirk Michael, Peel, St. John's.



J. A. Carvill, who, our readers will remember, was a successful competitor in last year's Senior Tourist Trophy Race, writing from Colorado Springs, U.S.A., says, "I hope to be back for the next T.T. and shall again ride a T.T. Triumph."

An idea of the growing interest taken in motor cycles, even by the uninitiated, is afforded by the accompanying illustration. It depicts a 7 h.p. T.M.C. with Turner coach-built sidecar which was left outside a Manchester cafe, and round which a crowd soon gathered. The policeman is seen keeping the crowd on the move.

Further New American Models.

THE following additions were made to the exhibits at the New York Motor Show after the report was published in these pages on January 11th. The consensus of opinion regarding this exhibition is that it was by far the best held in New York, both in attendance and actual business transacted. Next year may see the first independent motor cycle show in New York.

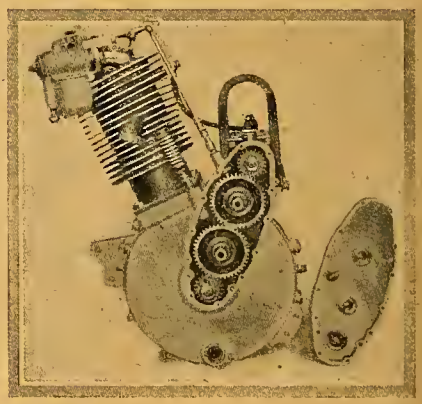
A new addition to the American motor cycle family is the Henderson, a 4 h.p. four-cylinder machine, shown by the company of that name from Detroit, Michigan. It attracted great attention, as a "baby" always does, but this was an extraordinarily big baby weighing 250 pounds. The frame differs radically from any motor cycle frame now in use, particularly having no upright frame member, such as the seat tube used in ordinary construction; the lengthy wheelbase, sixty-five inches, is also noticeable. The engine is started with a handle at the right side of the machine, and just forward of the engine is a footboard. The starting handle folds out of the way when not in use.

The Power Transmission.

In an extension at the rear of the crank case is a counter-shaft driven by a bevel gear on the rear end of the engine-shaft; at the end of the counter-shaft is an Eclipse free engine clutch, and from this a single chain connects with a driving sprocket on the rear wheel. The chain is entirely enclosed in a dust and water proof housing with a hinged door, giving ready access to the chain for lubricating. There is a lever pivoted on a lug on the crank case by which the clutch is operated, and a pedal operates the hub brake, which is a Musselman, a standard American coaster hub.

A Ten Horse-power Engine.

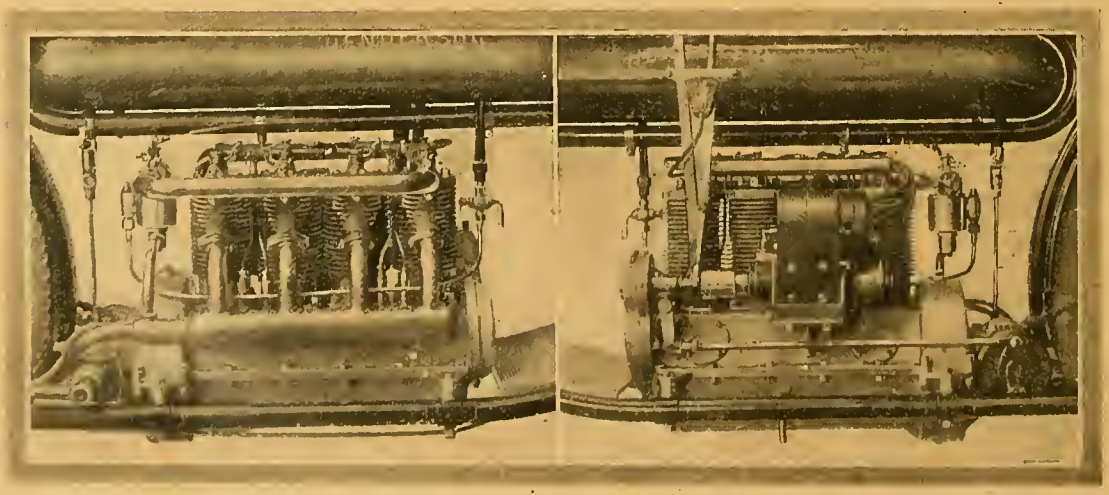
Having a bore and stroke of 2½in. and 3in. respectively, the four-cylindered engine is considerably larger than other motor cycle engines of this type. The general specifications include a Breeze carburetter, valves in separate pockets, intake directly over the exhaust, operated by a rocker arm and pushrod intervening between camshaft and rocker arm. The exhaust valves are at the bottom of the valve chamber, opened by upward thrust direct from the camshaft. Cooling is aided by large air spaces left between the exhaust valve pockets and cylinder walls. The Bosch magneto is the D.U.4 car type, with 60° of sparking range. Lubrication is by splash with a sight feed drip to the crank case. Clutch, carburetter, and throttle control are from the handlebars, with a patented ratchet device to hold the levers in place. The tank is cylindrical, holding 2¼ gallons of petrol and two quarts of oil, and the machine presents a handsome and bold appearance, being enamelled black with red and gold lines.



New Valve Mechanism.

In the New Era model (the New Era Auto Cycle Co.) originality, as far as America is concerned, is shown in the valve mechanism. The usual driving gear on the motor-shaft is fitted, and placed upward and forward therefrom in a direct line are found the exhaust and inlet cam gears and the magneto gear. Set obliquely in a single pocket forward and to the right of the engine are the valves. Directly in line with the centre of the exhaust cam gear, and operated by a direct thrust is the exhaust valve, with the inlet valve above it. The latter is operated by an overhead rocker arm and thrust rod working in connection with the third of the train of gear wheels.

Novel Accessories.

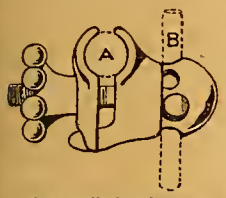


The Whittaker Chain Tread Co. showed a new motor cycle tyre chain made on the lines of the Parsons anti-skidding chains.

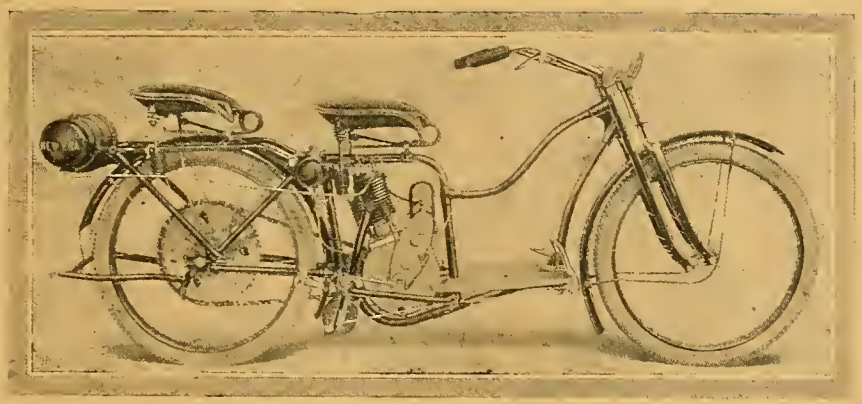
Several novelties were shown by the A. S. Noonan Tool Works. Among them their lamp bracket; this is made adjustable to carry any size motor cycle lamp. The same firm exhibited a flag staff holder, which we illustrate, to carry small flags.

The New Era power plant, showing magneto drive and method of operating the valves.

The Standard Thermometer Co. have brought out a new form of flexible shaft drive, to be used in connection with their speedometers for motor cycles. This flexible shaft runs through a rigid tube for about half the distance; the latter being held at either end, is prevented from moving while allowing the spring fork full action.



(1) Valve side of the four-cylinder Henderson.



(2) Chain side showing position of magneto and method of operating clutch.

Further New American Models.—

What is termed the "No-lag" magneto has been placed on the market by the American Circular Loom Co. The current generated in the armature is alternating, and is then transformed in a separate coil carried within the arch of the magnets and taken off as secondary correct current. In the two-cylinder model the contact breaker eliminates the necessity of stationary segments, as the breaker is stationary and the rotating piece is formed to give the requisite break intervals as required by the angle between the cylinders. By connecting a set of batteries to terminals on the coil, dual ignition is effected when the actual contact breaker is used to effect the timing.

A neat clip for clamping a small flag to the handle-bar at one operation.

Valve side of the New Era which, as will be seen, is supplied with a tandem attachment. It somewhat resembles the Danish mount—the Elleham.

What is a Complicated Trial?

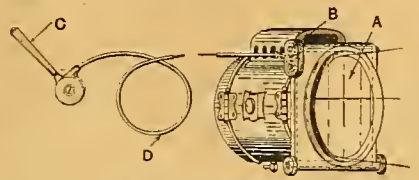
MR. C. C. COOKE writes with reference to our description of the Herts County A.C. trial, pointing out that timing was not on the split second system, competitors being allowed thirty seconds either side of their schedule. Even this is a fine limit for the majority of competitors who rely upon handle-bar watches. He says there were only three controls—St. Albans, Tring, and the finish. But, according to the route card, controls must be added at Barton-in-the-Clay, Dunstable, Princes Risborough, and Amersham, making *seven* in all—quite enough in a hundred miles run. Dunstable, he further points out, was not timed, but to this we would reply that the route card says, "timed out only for non-stop run to Tring." Mr. Cooke emphasises that the trial was not one of reliability only, in addition it was a sporting trial, and that is why non-stop sections were included. He adds: "Few know the infinite amount of thought, time, and work a trial of this description demands." We can assure Mr. Cooke that we fully appreciate the work and worry entailed, and that is why we could not help thinking how much easier it would have been for the officials, and how much less worrying to the competitors, if the trial had been made a straightforward non-stop throughout instead of a series of non-stop sections, which necessitated a constant watch on the regulations as well as on the route.

The General Opinion.

In defence of our criticisms we can only say that we were voicing the general opinion of competitors when we said that the trial was too complicated. Here is another proof. On three occasions we noticed competitors effecting adjustments in sections which were not observed, and acquaintances who passed called out "hard luck," thinking they had experienced trouble in the non-stop sections. The troubled one would look up in amazement and then scan the regulations once again.

We can quite imagine that the regulations appear anything but complicated to Mr. Cooke if he drew them up.

It appears that the S.I.A.M.T. rider whom we noticed repairing his belt by the roadside in the Herts County trial was not E. A. Marshall who was competing, but a member of the staff of Radium S.I.A.M.T., Ltd., who was out to see the fun.



Alfred B. Wade, who entered and rode a twin Zenith and sidecar in the above trial, had a most adventurous trip from Cardiff to the start, ultimately reaching Uxbridge some time after the competitors had left. He and his passenger, however, decided to make up time if possible, but missed the road, and while taking a corner at full speed pulled off the sidecar tyre. They wisely abandoned the trial here.

Anti-glare Attachment for Head Lights.

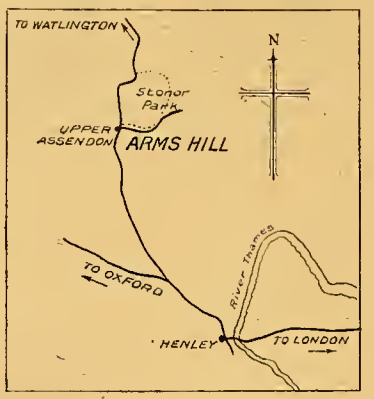
THE general appearance and nature of this device will be rendered clear by an inspection of the diagram. The essential feature consists of a semi transparent screen or blind mounted on rollers, actuated by springs and working immediately behind the front glass or lens, the whole surface of which it is capable of completely or partially covering. The screen itself is made of strong but thin flexible fireproof fabric, the degree of transparency being made to suit the power of the lamp, but only just sufficient to eliminate the dazzle.

By preference, the screen is coloured a reddish yellow on account of the fog penetrating qualities of a light of this colour but it can be tinted any desired shade to suit the user's individual ideas.

In its most approved form, the mechanism for operating the screen consists of a suitable train of gear wheels actuated by Bowden wire and self-locking lever, the latter being placed in any suitable position; but where the lamp is easily accessible, the arrangement is simplified by fixing a lever directly to the attachment.

The whole of the mechanism, screen, etc., is enclosed in a damp and dust-tight case, finished to match the body of the lamp. The attachment may be fitted to almost any make of existing lamp at a small cost.

To the considerate motorist the contrivance will at once recommend itself; its uses are obvious, *e.g.*, in passing through towns or villages, where a powerful front light is not required and liable to inconvenience other road users; passing restive horses, and for safely negotiating other traffic. Its use in fog is a great advantage, whilst in summer its use as a protection for the lens mirror and reflectors against the rays of the sun is not one of the least points in its favour.



The general adoption of such a device would do much to overcome the existing prejudice against powerful head lights, and would reduce to a minimum the number of accidents attributable to the use of such lights, particularly if one always knew exactly when to reduce the glare.

Further particulars may be obtained on application to the patentee, Mr. W. A. Muir, Balderton, Newark, Notts., to whom we are indebted for these particulars.

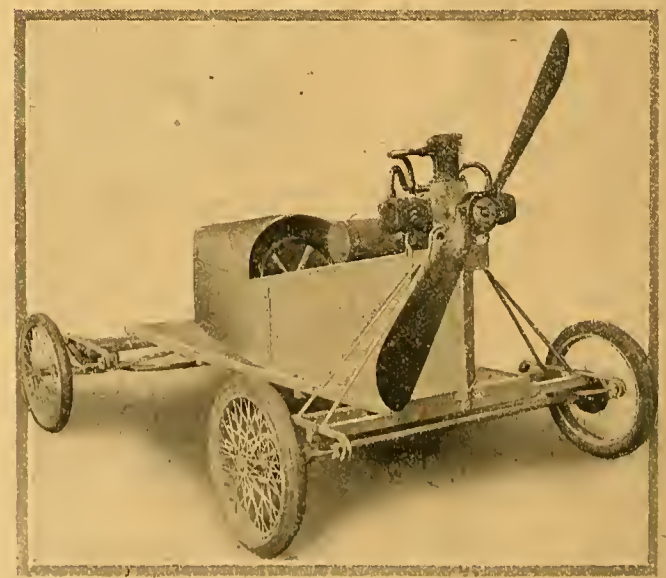
A Test Hill for Metropolitan Riders.

HITHERTO the only severe test hill generally known to motor cyclists in the London district has been that at Cudham Church Hill, with its actual gradient of 1 in 4.

North-west of London lie the Chiltern Hills, stretching north-eastwards to Tring in one direction and circling round *viâ* Berkhampstead, Amersham, and High Wycombe, back to the Thames at Henley. Within this district there are steep hills innumerable, and as a happy hunting ground for those riders who desire fresh precipices to conquer, no other neighbourhood easily reached from the centre of London can compare with the Chilterns. Kops Hill, Bledlow Ridge, Chinnor, and Kingston Blount are ascents now fairly familiar to motor cyclists, but the worst has apparently been overlooked, perhaps because it leads nowhere. I happened across this truly fearsome grade about six years ago, whilst pottering up and down the lanes between Henley and Watlington in search of something to test the climbing abilities of a car. Upon this first occasion a friend and I, after a walk to the top, decided that discretion was the better part of valour, and did not attempt the impossible with a 20 h.p. 1905 vehicle. Local enquiries revealed the fact that, up to the time of this first visit, no self-propelled vehicle had ever reached the summit. On a recent fine day, I again essayed the climb upon a car and succeeded, and, so far as I can learn, this is only the third car that has achieved the feat. But one motor bicycle has gained equal success, and then only after the rider had spent nearly two days on the hill and made many failures.

How to get to Arms Hill.

The situation of Arms Hill is 3½ miles from Henley-on-Thames, and is reached by the following route. Riding from London, and crossing the Thames at Henley Bridge, proceed up the wide High Street and take the narrow right-hand turning which leads through Nettlebed to Oxford. After leaving Henley streets, the road opens out into the straight and level Fair Mile. At the end of this straight stretch, the road forks left and right where an inn stands at the junction. The right fork is the correct route, where a direction post points to Watlington, and 2¾ miles of gradually rising ground is traversed to the tiny village of Upper Assendon. Watch for the Stonor Arms on the right, and on the same side of the road, fifty yards beyond, is the commencement of Arms Hill. The entrance from the road just traversed is marked by a huge traction engine, permanently stationed outside a flour mill, the engine serving to drive the grinding machinery of the mill. The spot can be further recognised by a row of six brick built cottages immediately facing the mill and edged by some granite kerbing that forms the only available take-off.



The hill is no longer employed for traffic, as a much easier road was cut out many years ago, which joins the hill at the top, with the result that the first 250 yards is overgrown with grass. As the grade steepens, the grass gives way to a carpet of loose stones, to develop into a surface scored in all directions with rain gullies. The hill goes straight ahead for some 600 yards, becoming steeper and steeper, and then suddenly widens out on a left-hand bend where the surface is surprisingly good. It is just above this bend that the worst pitch occurs, which I estimate to be

1 in 3,

and to prevent the road being wholly washed away during storms, a pair of elliptical iron pipes have been placed on either side to carry off the water. The bad portion of the hill extends for about 150 yards, and then takes a sweeping bend to the right, beneath a mass of overhanging tree tops, and in another 600 yards of 1 in 5½ reaches the level lane at the top.

The total length is some 1,200 yards, and after personally tackling pretty well every known and unknown grade within 100 miles of London, I have no hesitation in asserting that Arms Hill is veritably the steepest hill within that radius of the Metropolis. The difficulty of overcoming the steepest portion is accentuated by the grass at the foot, because a couple of hours rain converts the latter into a sticky surface which tyres refuse to grip. A club in search of excitement for its members might do worse than arrange for a Saturday afternoon trip to Arms Hill, and I can prophesy plenty of fun for both riders and spectators. The hill is seldom used by anyone, so that a hill-climb would not inconvenience others, and there would be little or no difficulty in obtaining permission to use it.

COLUMBUS.

A novel quadcar exhibited at the Brussels Show. It is propelled by a motor cycle power unit coupled to an aeroplane propeller or fan. It is a coincidence that one of our staff had roughly designed a similar machine for inclusion in these pages.

Sutton Coldfield A.C. Open Reliability Trial.

The Regulations Reviewed.

THE start will be at 9.30 a.m., February 17th, from the Gun Barrels Hotel (Bristol Road), Birmingham. Route will be Selly Oak, Rose Hill, Bromsgrove, Alcester, Stratford, Sunrising Hill, Warmington Hill, Banbury (lunch), returning in same direction to Alcester and then direct Birmingham Road to tram terminus, Alcester Lane. Observations will be taken on all performances on each of the test hills, namely, Rose Hill, Sunrising Hill, Warmington Hill, Edge Hill, and Gorcot Hill.

METHOD OF MARKING.—Each competitor will be given 200 marks as maximum. The competition will be conducted as an absolute non-stop run excepting at the usual controls. Marks will be deducted for any stops whatever, other than those just referred to. No adjustments whatever will be permitted.

Penalties.

Ten marks will be deducted for actual failure to climb any of the test hills, five marks will be deducted on each hill if the machine be assisted by pedalling, and no competitor will be allowed to dismount and run with machine. Marks up to the limit of five will be deducted from those unable to make an easy start, but free engine and two or three-speed machines will not be given any preference on this count. One mark for each complete minute in excess of one minute will be deducted for being either late or early at checked points. For a stop of any kind ten marks will be deducted. Marks up to the limit of ten will be deducted for machine or rider finishing in an unreasonably dirty, muddy, or oily condition.

SILENCING.—Cut-outs, if fitted, must not be used or must be sealed; noisy machines will be disqualified.

Engines will not be allowed to run on stand at any time after the actual start of the competition; no competitor with a free engine may start his engine until he receives the word "go" at each control.

The schedule time has been worked out at 20 m.p.h., there will be a stop of one hour for lunch at the Red Lion Hotel, Banbury, and also one of thirty minutes on the outward and homeward journeys; one minute will be allowed in which competitors may be either late or early at each of the controls in order to correct any slight errors that may occur.

Awards.

The Colmore cup will be awarded together with a gold medal to the competitor making the best performance throughout the day, and all those making non-stop runs and arriving at the finish within schedule time will be awarded silver medals. An additional gold medal will be awarded for the best performance of an amateur. Also pair of Kempshall tyres (presented by Kempshall Tyre Co., Ltd.) for best performance by an amateur member of the Sutton Coldfield A.C.

Marks will be awarded to all members of the club for the Murratti-Ariston trophy, and also additional marks to amateur members for Ixion challenge cup. All members competing will be awarded two marks.

FOR MURATTI-ARISTON TROPHY.		FOR IXION CHALLENGE CUP.	
1st member	8 marks.	1st amateur member	8 marks
2nd ,,	6 ,,	2nd ,, ,,	6 ,,
3rd ,,	3 ,,	3rd ,, ,,	3 ,,

Mr. James St. John, 33, Fountain Road, Edgbaston, is the trials hon. sec.

All competitors must be provided with A.C.U. licences.

A.C.U. Spring and Autumn One-day Trials.

Summary of the Conditions for the Spring Trial on March 2nd.

ENTRIES.—Entries must be received by Saturday, 24th February, together with either of the following entry fees: Manufacturers or agents, two guineas; private owners, members of the A.C.U., or Affiliated Clubs, half-a-guinea; non-members, two guineas. Not more than three entries will be accepted from any manufacturer.

THE START.—The competitors will be started at 8.30 a.m. from ————, and will be expected to accomplish the journey without any stop other than as officially recorded. One hour and a quarter will be allowed for luncheon, but no adjustments will be permitted.

THE COURSE.—The course will be one of about 160 miles in length, but the actual route will not be announced until the morning of the trial. A competitor may not leave the course under any circumstances whatever, and will be penalised or disqualified at the discretion of the judges if it be found he has done so.

HILL TEST.—A minimum speed will be set for two severe test hills, and every machine to gain a first class certificate will be expected to climb the hill at the speed set for that particular class, as follows:

	Minimum speed.
For machines not exceeding 350 c.c.	10 m.p.h.
,, ,, above ,,	15 ,,
Passenger machines	7 ,,

A stop will not be permitted at the foot of the hills.

Pedalling is prohibited for any machine except on the test hills, and then only in the case of machines having engines not exceeding 300 c.c. for single-cylinder and 350 c.c. for multi-cylinder engines, and only when a change-speed gear is not fitted. Passenger machines must climb the hills with passenger and driver seated in normal maner.

JOURNEY.—The maximum running time for the journey will be at the rate of 18 m.p.h., and the minimum 20 m.p.h.

Each entrant of a passenger machine is required to find a male observer, weighing not more than twelve stones, and such observer will not be permitted to travel on the machine of the entrant, but shall be allocated to the machine of another competitor, the driver of which shall be responsible for the return of such observer to the finishing-point. This rule will be strictly enforced. Such observer will be under the control of the Union, and will be required to make observations throughout the whole of the trial, not only with regard to the machine on which he is travelling, but also with regard to all machines which come under his observation, and to furnish a report of his observations at the conclusion.

The entrant must provide a full size waterproof rug for the comfort of the observer.

The road wheels of any machine entered may not be brought to rest under any circumstances whatever, except for exigencies of traffic. Drivers of motor bicycles who dismount for the purpose of running beside their machines, or who kick on the ground for the purpose of assisting their machines, will be recorded as having failed. Drivers of passenger machines which shed their passengers will be recorded as having failed.

To Qualify for a Certificate.

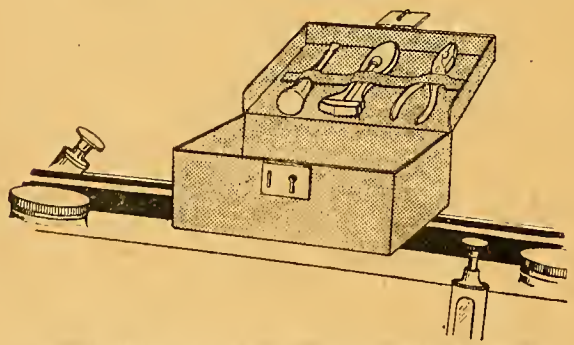
To qualify for a first class certificate, a machine must conform to the following requirements and be equipped with:

1. Free engine or variable gear.
2. Two brakes working independently.
3. Mudguards of ample dimensions—For 1¾in. tyres, 2½in. across the chord and 3in. over all; for 2in. tyres, 3in. across the chord and 3½in. over all; for 2¼in. tyres, 3½in. across the chord and 4in. over all.
4. Stand and luggage carrier.
5. Efficient silencer, which does not exhaust directly on to the road.
6. Magneto reasonably protected from mud, or placed in a sheltered position.
7. Tool bag of ample capacity.
8. Tyres of standard size.
9. Lamp complete.
10. Spring front forks.
11. Lubricating oil tank capacity—for lightweight 1 pint, others 1 quart.

In addition, the machine must be in good condition and reasonably clean and the engine and crank case reasonably free externally from oil, at the conclusion of the trial. Cut-outs may not be used, and if fitted must be sealed. The judges shall have power to disqualify noisy machines.

The weights of all machines will be taken.

TOOLS AND SPARES.



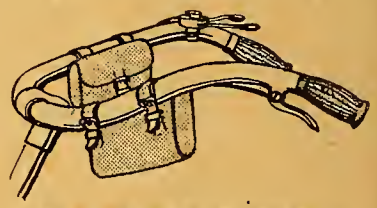
Some Hints on the Arrangement of Toolbags and Carriers.

"MAY I borrow a screwdriver for half a minute?" "With pleasure!"—and I watched. The process was an interesting one. Stooping down to look under a large flat suit case, strapped on top of the carrier, my obliging friend proceeded with some difficulty to undo two straps and a snap lock. This allowed the top of the pannier bag, in which the search was to be made, to open about an inch and a half. The end of a tool roll was coaxed out, and a series of sharp pulls produced the rest of it with a few tools sticking to it at intervals. The screwdriver was conspicuous by its absence. Some sleight-of-hand tricks with the loose tools still in the empty bag, followed by a repetition of the whole process on the other side of the machine. produced the coveted weapon. But the man looked hot, and I was sorry I had troubled him.

Convenience in Attachment.

Now was all this necessary? The modern motor cycle is a machine which, if properly looked after, seldom requires mechanical adjustment on the road—nevertheless a spanner, like a revolver, when it *is* wanted, is wanted badly and in a hurry. This being the case, why should we keep it wrapped up in a wallet which is tucked away in any place on the machine which to the designer's eye appears a trifle naked?

We have toolbags which shake open, toolbags which break their fastenings and drop off, which let the rain in and forget to let it out again, which sag out of shape and collect the mud off the back wheel, or develop holes in the bottom and lay a trail of tools and spares to tempt the wandering yokel from his rightful duties. All this and more because the much-abused toolbag is looked upon as an accessory and not as an essential part of the machine.



Toolbag affixed to the top tube, a pattern which Mr. J. L. Norton claims to have introduced. The screwdriver, pliers, and adjustable spanner, are all in an accessible position in the lid of the box.

It would seem, then, that with all these tricks the wily toolbag is worth watching, and the only place where it can be safely under observation and at the same time handy when needed is in front of the rider, either on top of the tank or on the handle-bars. The latter is the position adopted by several well-known competition riders and by a few of the leading makers. It is a great advance on the bag fixed to the carrier, but is open to one or two minor disadvantages. Briefly, the weight of a full toolbag with tools and spares is considerable, and will affect the steering appreciably; the bottom of the bag being wide and unsupported it is apt to sag under the weight; the attachment of the bag may interfere with other handle-bar fixings, such as speedometer and generators mounted inside the bar. Also the appearance is hardly neat when the bag gets worn and old.

The Ideal Position for a Tool Case.

The first position mentioned seems to be the ideal one, on top of the tank. Here it is immediately get-at-able, even while riding, it keeps clean, does not sag, and there is little tendency for the fastenings to break or come loose since they take no weight. One great disadvantage of fastening the bag to the carrier is the inconvenience caused, as in the case of my friend before mentioned, when other luggage has to be carried above it. This is a great point in favour of the tank position, for it is in the way of nothing, provided sufficient care be taken in fitting the bag to leave room to reach filler caps and oil pump. Here, also, it is directly under the rider's eye, and is less liable to be left open. Should it come unfastened the defect is immediately apparent. It is best fastened with a snap-lock, which can be locked with a key on putting the machine into a strange garage for the night. It is extraordinary how tools "leak" out during the night without anyone knowing anything about it next morning.

Showing small bags on the handle-bars for light tools and sundries.

Having thus selected the place for the toolbag, we may briefly discuss the best methods of carrying in it all that may be required by the average rider.

Separate Compartments for Certain Tools.

First of all we consider the three indispensable tools, the shifting spanner, screwdriver, and combination pliers. It is seldom we need more than these for a casual adjustment. Get the nearest saddler to sew a strip of stout leather across the inside of the top of the case with three loops for these three tools. It will cost sixpence and save pounds worth of labour and temper before needing renewal. Thus on opening the bag the three most needed tools are at once available without disturbing any of the rest of the contents.

Every motor cyclist has his pet selection of tools and spares, and it is needless to go into such a list here. We may refer the reader to such books as "Hints and Tips for Motor Cyclists" or "Motor Cycles and How to Manage Them" for further information on the subject. But whatever the selection may include, always carry the repair outfit, complete with tyre levers and gaiter, separately in a roll. The extra tools, of course, will be carried in a second roll. Here it may be mentioned that the rolls with the end flaps are the most convenient, though they take up slightly more room. Without end flaps the small sharp ends of files and other tools will work out, and either bore holes in the sides of the case or rattle; the tools also have an

Tools and Spares.—

inconvenient way of falling out when the roll is opened. The writer always carries a small soft leather pouch, such as is sold for push cycles, inside the larger toolbag, in which are placed all the miscellaneous collections of bolts, nuts, washers, belt fasteners, and other oddments which every rider hoards up for himself. These should not be allowed to shake loosely together inside the bag—the nuts keep bright if allowed to do so, but this is the only advantage; the disadvantage is that after two hundred miles the threads of all the bolts are hopelessly worn and burred up, screws have come out of their belt fasteners and are useless, and a fine black metallic powder is produced which penetrates into every crevice and eventually rusts there. The odds and ends should never be carried in a metal box.

We see then that the whole of the tools and spare gear may be divided into four bundles. The T.T. rider will have no difficulty in getting his four into the tool case on the tank. The potterer and the weight-carrier, however, will probably find their bundles too bulky to go into one bag. To them we would recommend the plan of strapping their oddments pouch to the handle-bar, in which case the pouch should be of better quality and water-proofed. If necessary another similar pouch to hold a few of the lighter tools may be strapped on the opposite bar to match. They will not look unsightly, and will leave room for the more bulky kit in the large case.

The ordinary stops on the road are caused by puncture, or a nut or bolt shaking loose; the whole kit necessary for either of these repairs may be spread out in less than three seconds without disturbing anything else in the toolbag. Surely this is an advantage, especially when a stop is necessary in bad weather or when time is of importance.

Tool Cases de Luxe.

An elaborate case may be made for carrying tools and spares by carving out a block of wood so that each tool or spare fits accurately in a space made for it, which cavity may be lined with thin baize. Another method is to fit the tool case with shallow trays in which paraffin wax has been poured. Each tool or spare is then embedded in the melted wax, and when removed after the wax has set there is a perfectly snug nest for each article. These methods are expensive and bulky, but can be done quite well on sidecar machines, and will be found to save time, trouble, and keep away irritability when anything goes wrong on the road.

To follow out the points mentioned in this article may involve a little trouble and expense, but experience has proved over and over again that both are amply repaid by the saving of time and trouble on the road.

J.G.T.

Variable Gears and Motor Cycles.

V.—How to Use a Variable Gear.

AS a conclusion to my notes on variable gears, a few remarks on their use may not be out of place. It will be readily understood that, given a certain velocity along the road, the engine must be turning faster, in some cases twice as fast or even more, when the low gear is in use. Therefore, in changing from high to low there is no need to raise the exhaust valve, or, if a separate clutch be fitted, to declutch; as the moment when the engine is running free enables it to quicken up, and if the change is well timed it will be running at the correct number of revolutions to take up the low gear without jar or jerk, even when the change is made by dog clutches, or sliding teeth. On the other hand, when changing up, the speed of the engine must always be reduced, if the high gear is to come into engagement smoothly and pleasantly. This is most easily done by raising the exhaust at the moment of change, thus as before giving the engine time to change its velocity, but this time to slow down. The same rules apply when the engagement is made by friction clutches, but so much care is not needed, though it is desirable.

"Slam-bang Too Much."—Kipling.

Even when a gear is said to be so fool-proof that it can be slammed or banged in without damage, I would strongly advise riders to abstain from following such advice, for extra strength in the gear will only throw extra strain on the engine, transmission, frame, and tyres. It stands to reason that the speed of an engine cannot be suddenly reduced one-half or the speed of the machine doubled in an instant without placing great and undue strain upon the mechanism, and no one who has any sympathy with his engine would attempt such a thing. The clutch possibly would slip a little, and belt likewise, and so relieve the other parts slightly, but why subject these parts to more strain than is absolutely necessary? They have enough to stand in legitimate use, and so have the tyres. Forcing the tyres to slide on the road will cause more wear than miles of fair running, and also induce side-slip.

Ratio of High to Low.

Many gears have a 1 to 2 ratio from high to low, especially those made on the epicyclic principle. This is, I think, too much for solo work, though it may be required for sidecars, but even this is a disputed point, as slow climbs on a very low gear are trying on hills that are just too steep to be taken on top. This points to the desirability of a third gear and the great advantage held by variable-speeders. Personally, I should say that a 2 to 3 ratio between high and low was quite sufficient, *e.g.*, 4½ to 1 on top, 6¾ to 1 on low, would be very suitable to a standard 3½ h.p. single. The low gear would be found useful in towns and on muddy roads, as well as on hills. At a speed of 10 m.p.h. or less it would be pleasanter to ride, and the tendency to side-slip would be lessened considerably. For sidecar work a lower gear is to be recommended. Then the rider is faced with an alternative of a rather low top gear, a long drop between the two gears, or the fitting of a three or variable speed gear. If the pocket admits, I should certainly choose one of the two last; if not, the low top gear is to be preferred.

AURIGA.

CLUB NEWS.

Cambridge M.C.C.

The annual general meeting will be held at headquarters, the Blue Boar Hotel, Cambridge, on Wednesday next, the 7th inst., at 8.30 p.m.

Huddersfield and District A.C.C.

The prize distribution took place on the 24th ult. Ninety members were present The evening concluded with a musical programme.

Liverpool A.C.C.

The annual general meeting was presided over by Mr. T. Mogridge. There was a good attendance. The election of officers resulted as follows: Vice-president, Mr. V. Barton; chairman, Mr. L. Mogridge; treasurer, Mr. O. Lindop; secretary, Mr. C. Hobbs; captain, Mr. E. F. Baxter; The question of affiliation with the A.C.U. was referred to a committee.

Wimbledon M.C.C.

There will be a club run to Burford Bridge, Dorking, on the 4th inst., starting from the Town Hall at 10 a.m. The following officers have been elected: Captain, Mr. E. P. Lyon; vice captain, Mr. W. P. Tippett; hon. treasurer, Mr. E. T. Lyon; hon. secretary, Mr. G. B. Barham, 347, Kingston Road, Merton Park, S.W. The opening run was along the Portsmouth Road, when the attendance was quite good.

Oxford M.C.C.

The annual meeting of this club, which was well attended, took place at the Hotel Restaurant Buol, Oxford, on Wednesday, January 24th.

The following officers were elected:

Captain, Mr. H. G. Hill; vice captain, Mr. G. F. Cooper; hon. treasurer, Mr. Ernest Lewis, A.C.A.; hon. secretary, Mr. W. A. Matthews; trials hon. secretary, Mr. F. G. Barton.

A scheme for establishing a club room was put before the meeting which, if carried into effect, would require an increased subscription, and it was decided to take a ballot.

The annual dinner will be held at the Hotel Restaurant Buol, Oxford, on Saturday next.

Motor Cycle Union of Ireland (Ulster Centre).

The annual general meeting of this centre was held on Friday evening, the 26th ult., in the Grand Central Hotel, Belfast. Mr. R. G. Lindsay (president) occupied the chair, and there was a large attendance of members. The secretary submitted a most satisfactory report of the year's work, progress being recorded in every direction. During the year thirty-four new members were enrolled. The financial statement was equally satisfactory The following officials were appointed for the present year: President, R. G. Lindsay; hon. sec., Mr. L. Maclaine; hon. trials sec., Mr. D. H. O'Flahety; hon. treasurer, Mr. I. Holden. It was unanimously resolved, on the motion of the Chairman, to amend the rules to permit cross-Channel motor cyclists being admitted to membership at half the usual annual subscription, thereby entitling them to compete in all events confined to members. It is hoped a number of English riders who occasionally cross to the Emerald Isle will take advantage of this privilege.

Dublin and District M.C.C.

A very satisfactory record of progress was presented by the hon. sec. and hon. treasurer at the annual meeting of the above club, which was held under the presidency of Mr. F. A. Wallen on Wednesday, the 17th ult. The membership increased by 60% during the past season, and 80% more money was offered in prizes than in the preceding year. Despite this drain, the balance carried forward was 50% more than the amount brought in. The officers for the coming season were elected as follows: President, Dr. Reginald White; hon. sec., Mr. F. J. Walker, 9, Grafton Street, Dublin; assistant hon. sec., Mr. J. L. Walsh; hon. treasurer, Mr. J. Molloy; captain, Mr J. Browne; vice-captain, Mr. J. Doleman. It was decided to affiliate to the Motor Cycle Union of Ireland. The programme of the coming season was discussed at length, and many prizes were offered during the evening.

Wolverhampton M.C.C.

The above club held its first whist drive and dance on Monday, the 22nd ult. There was a good attendance.

Wigan M.C.

A hot pot and smoking concert will be held at Dog and Partridge Hotel, Wigan, on Wednesday, the 7th inst., at 7.30 p.m. An excellent programme has been arranged.

Bournemouth and District M.C.C.

A club with the above title has been formed, the organising committee including Messrs. Noble Iddon, J. Harvey, A. G. H. Alsford, and F. G. Goldney.

Sheffield and Hallamshire M.C.C.

To-day (Thursday) Mr. J. L. Norton will lecture on "Efficiency and Power" at headquarters. All members and friends are cordially invited. The annual general meeting will take place on February 8th.

Scarborough and District M.C.C.

Mr. J. L. Norton will lecture to-morrow evening on "Timing and Efficiency." The annual general meeting will take place on the 28th inst., at 8 p.m.

Legal M.C.C.

The Law Students' Union is undertaking the formation of a Legal Motor Cycling Club. Solicitors, barristers, articled clerks, clerks who have been articled to solicitors, and bar students will be eligible for membership, and any who are desirous of joining should communicate with Mr. C. F. King, 21, Arundel Gardens, London, W.

Cork and District M.C.C.

The annual general meeting took place on Friday evening. The reports from the hon. secretary and treasurer showed that the club had a very successful season. The hon. secretary, Mr. R. S. Russell, 4, Princes Street, Cork, will be pleased to give full information to prospective members.

Halifax and District M.C.C.

The annual general meeting was held at headquarters, the Old Cock Hotel, on Wenesday, the 24th ult. The officers elected for the ensuing year were: Mr. M Youngman, president; Mr. J. Haigh, treasurer; Mr. E. C. Bedding, hon secretary.

Putney and District M.C.C.

The annual dinner will be held at the Comedy Restaurant, Panton Street, Haymarket, on Saturday next, the 3rd inst.

The annual general meeting will be held at headquarters, the Northumberland Arms Hotel, at 9 o'clock on Saturday, February 10th. Items for the agenda should be sent to the hon. sec. before this date. The prizes will be distributed to the winners for 1911. The opening competition on February 18th will take the form of a members' reliability trial to Oxford and back.

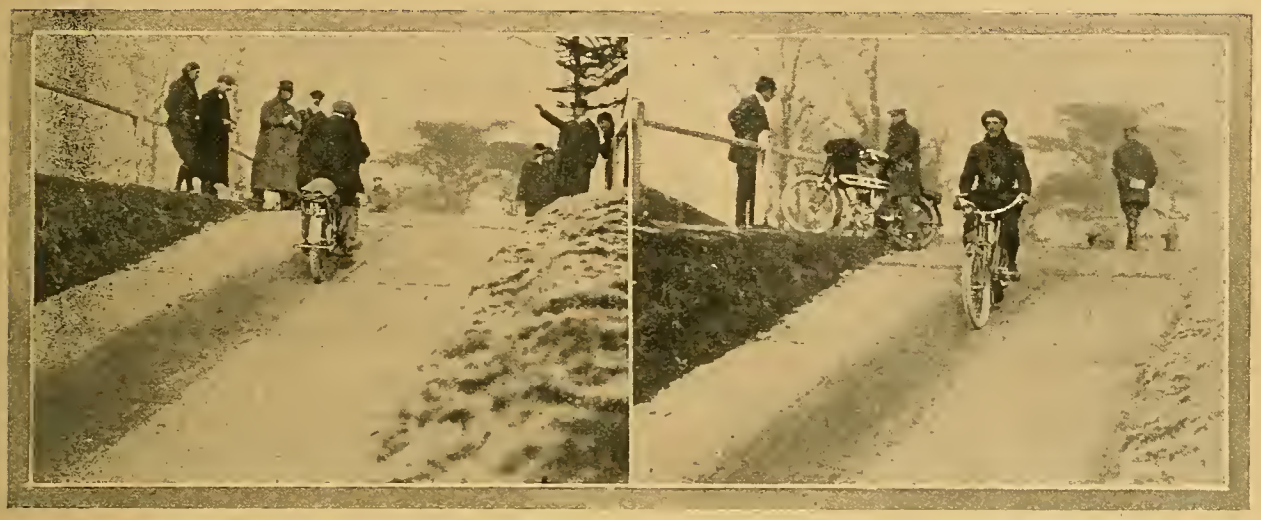
Harrogate and District M.C.C.

The annual gymkhana held on Wednesday, January 24th, in the Skating Rink, proved more enjoyable than ever. The entry was rather small, but this was accounted for, to some extent, by the adverse weather. There were eleven events altogether, which resulted as follow:

Tilting at Rings.—1, H. W. Fortune (3½ New Hudson); 2, W. E. Grange (2½ Premier).

Egg and Spoon Race.—1, F. Stafford (3½ Humber); 2, W. B. Atkinson (3½ Triumph).

Ring and Bucket Race.—1, W. E. Grange; 2, T. Maynard (3½ Triumph).



Obstacle Race.—1, H. W. Fortune; 2, F. Stafford.

Musical Chairs.—1, F. Stafford; 2, W. E. Grange.

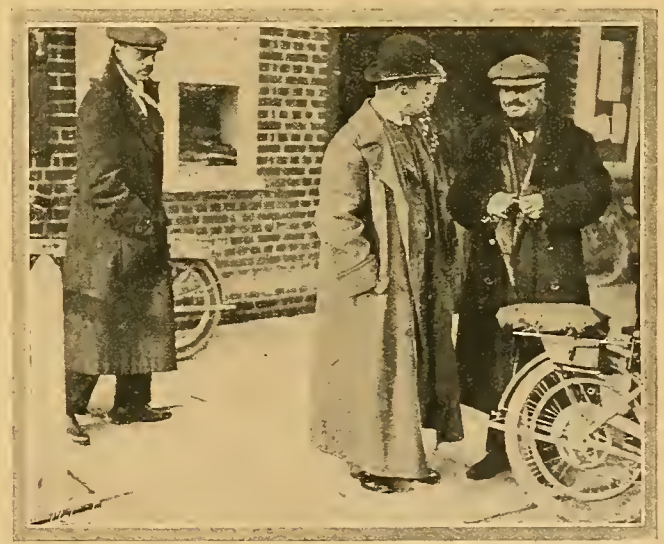
Foot and Wheel Race.—1, W. E. Grange; 2, E. R. Davies (3½ Triumph).

A tricycle race was an innovation, the maker of the fastest lap to be the winner. F. Stafford, who was the first to start, found the machine unmanageable, and going off at a tangent, finally ended up among the spectators. Tindall turned the first two corners, but had trouble on the straight, when the machine decided to go amongst the spectators and Tindall to turn a beautiful somersault. The remainder were painfully slow, but J. Mackay proved the winner.

WAR OFFICE TEST AT BROOKLANDS.

(1) H. V. Colver (Enfield) nearing the top of the test hill on the 1 in 4. F. W. Barnes (Zenith) descending after making a good climb.

AS was announced exclusively in these pages last week, the Transport Committee of the War Office decided to hold a private motor bicycle trial on Brooklands track on Monday last, with a view to finding out how nearly the machines they had invited to attend would come to their ideal. The War Office ideal was forty-five miles an hour for machines up to 500 c.c., and forty miles an hour for machines up to 350 c.c. Machines in both classes were expected to take a 12 stone rider up the test hill from a standing start. The committee present consisted of Colonel H. C. L. Holden, R.A., C.B., F.R.S., Major O'Donohue, A.S.C., Major Stevenson, D.S.O., R.E., Captain H. E. Davidson, R.E. (Secretary of the Transport Committee of the War Office), Major Cumberlege, A.S.C., and Mr. Phelps, of the India Office.



Monday morning was bright and frosty, there was no wind, and though it had been very foggy in town, the mist had almost entirely cleared from the track at 11 a.m., when nearly everyone had arrived. As soon as a sufficient number had collected they repaired to the fork, and the following riders with their machines took their places at the starting point:

The Competing Machines and their Riders.

H. V. Colver (2¾ h.p. two-speed Enfield).
G. L. Fletcher (2¾ h.p. two-speed Douglas).
Hugh Gibson (3½ h.p. Bradbury, N.S.U. two-speed gear).
*W. F. Newsome (3½ h.p. Triumph, free engine).
F. W. Barnes (3½ h.p. Zenith-Gradua, variable gear).
P. Shaw (3½ h.p. P. and M., P. and M. two-speed gear).
*S. Spencer (3½ h.p. Rudge, free engine).
R. Holloway (3½ h.p. Premier, Armstrong gear).
*The only single-geared models.

Gibson's machine was fitted with an elaborate belt guard, which he assured us he had found most successful, especially when it had first been tried in the London-Exeter Run. Newsome's Triumph was geared 5 to 1, and he did not alter his adjustable pulley throughout the test. Spencer's Rudge had the exhaust pipe running into a silencer, whence there issued a long extension pipe with a flattened end, terminating near the rear axle. R. Holloway (3½ h.p. Premier, Armstrong three-speed gear) arrived late and was allowed to start some time after the others.

The riders and their machines had to make two circuits of the track, the first lap being timed from a standing start and the second with flying start. The order of the first lap was: Barnes leading by 100 yards; Newsome, Fletcher, and Shaw in close order; and after came Colver and Spencer. Gibson was right behind, owing to a sooted plug. At the end of the second lap Barnes led easily, and was followed by the same three in close order, namely, Shaw, Fletcher, and Newsome. Then came Colver, then Spencer, whose inlet tappet rod jumped out of position just as he had completed the second lap. Gibson's delay was

Capt. Davidson (left), secretary of the War Office Transport Committee, and Colonel Holden (centre). The last-named is seen chatting with our London editor.

War Office Tests at Brooklands.—

due to a sooted plug, and consequently both he and Holloway, who arrived late, were timed separately. No official times were announced, but it is reported that Holloway, on the Premier, travelled very fast. The unofficial times which we publish were taken by Mr. Harry J. Swindley.

The Speed Trial.

FIRST LAP TIMES (STANDING START).

	m.	s.	m.p.h.
F. W. Barnes (3½ Zenith)	3	46⅖	= 43.2
W. F. Newsome (3½ Triumph) ...	3	48	= 42.9
G. L. Fletcher (2¾ Douglas) ...	3	48⅗	= 42.8
P. Shaw (3½ P. and M.)	3	49⅕	= 42.7
H. V. Colver (2¾ Enfield)	4	12⅖	= 38.7
S. Spencer (3½ Rudge)	4	19	= 37.8
Hugh Gibson (3½ Bradbury)			
R. Holloway (3½ Premier)			

SECOND LAP TIMES (FLYING START).

	m.	s.	m.p.h.
F. W. Barnes (3½ Zenith	3	40⅗	= 44.2
P. Shaw (3½ P. and M.)	3	50	= 42.5
G. L. Fletcher (2¾ Douglas) ...	3	52⅖	= 42.0
W. F. Newsome (3½ Triumph) ...	3	53	= 41.9
H. V. Colver (2¾ Enfield)	4	18⅘	= 37.9
S. Spencer (3½ Rudge)	4	19	= 37.8
Hugh Gibson (3½ Bradbury)			
R. Holloway (3½ Premier)			

The Hill Test.

Immediately after the conclusion of the speed trial the hill test took place. The first man up was F. W. Barnes, who was timed by Mr. Swindley roughly to accomplish the distance in 9⅖s. The official time-keepers, however, did not take this time. R. Holloway came up in 18⅖s., Shaw in 12⅘s., Newsome (with the same 5-1 gear he had employed in the speed test) in 17⅖s., Fletcher in 15⅗s., Barnes (on his second attempt) in 12⅘s. Gibson, who had been in the wars and had broken his pedalling chain, ran into the bank on his first attempt, but got up in 15⅗s., Spencer in 18⅗s., and Colver in 19⅗s.

It was then intended to weigh the machines and their riders, but unfortunately this could not be accomplished, as the weighing machine was water-logged, and even though most of the water had been pumped out it was found quite impossible to make it work properly.

Altogether the test was quite an interesting one, and though the Zenith was the only machine which apparently satisfied the War Office officials, we do not think we should be very far wrong in saying that all accomplished what was required of them, as we were led to understand that the War Office ideal would not be absolutely insisted upon. Though Holloway's Premier and Gibson's Bradbury could not, owing to their starting late, be timed by Mr. Swindley, it appears that they satisfied the judges. Quite a feature of the trial was the splendid way in which the 2¾ h.p. Douglas kept up with the two other machines of 3½ h.p. in the speed test. In the hill test Barnes and Fletcher shone conspicuously, while Shaw, it will be noticed, also did particularly well.

ICE SCENES AT BROOKLANDS.
W. Stanhope Spencer, the single-cylinder hour record holder, tries his Rudge on the ice. He was much happier on skates.

Major Stevenson and Capt. Davidson conversing with W. W. Douglas and G. L. Fletcher in the paddock.

Aviators and motor cyclists proved themselves at the beginning of the week at Brooklands as expert on the ice as on their machines.

Cost of Running a Motor Cycle.

A Selection of Replies to a Reader's Query.

See also pages 1197, 1247, 1318A, 1357, 1380, *and* 1422 (1911), 5 *and* 64 (1912).

Sir,—Having read in your columns the small expense incurred by many motor cyclists, I send you my own, which may be of interest.

The conditions under which a cycle is run by an officer in a seagoing ship are naturally very different from those ashore. Storing at various garages, waste of petrol through emptying tank when bringing the cycle on board, and other items rendered necessary, all combine to swell the running expenses.

The high first cost is shown in detail.

The depreciation is also naturally high in a specially-fitted machine, so I allow £30, as probably the cycle will be sold after another season, when possibly only £30 will be obtained, leaving a deficit of approximately £60 to be spread over two years. The following are the details:

Prime cost—			
Standard Triumph, 1911		£48	15 0
Roc gear, 1911		12	12 0
Special back stand		2	2 0
Extra silencer		1	10 0
Lamp complete		1	15 0
Extra for Brooks' anti-vibratory seat			19 0
Horn, cross-bar, plug, valve, registration, and number plates		2	19 7
Erecting and assembling machine:			
Labour £6 14 3			
Material 16 2			
		7	10 5
Soare starting handle, etc.			14 6
A.S.L. fork and saddle air springs		5	19 0
Sundries		1	1 0
Total first cost		£85	17 6
Current expenses—			
Licences		£1	5 0
Insurance		4	10 3
Storage and cleaning		2	15 6
Petrol		1	13 1
Small alterations and fittings			19 0
Oil and grease			9 4
A.S.L. air springs, spare parts, and repairs			8 3
Small spares, not otherwise included			6 9
Two belts and repairs		1	17 3
Repairs and overhauls of engine and cycle, not otherwise included		1	1 0
Roc gear, renewals, repairs, dismantling for cleaning three times and re-assembling, etc.		3	10 0
Tyres—repairs, patches, etc.			17 1
Lamp carbide, etc.			2 2
Sundries, overalls, carriage by rail, etc.		2	6 1
Total running expenses		£22	0 9

The machine was delivered in March, 1911, and has only run 2,338 miles, all solo.

Results are roughly as follows:

		Cost per mile.
Actual running expenses	£16 5 6	1.67 pence
Total running expenses, including insurance and licences	22 0 9	2.26 ,,
Season's cost, including depreciation £30	52 0 9	5.3 ,,

The expense having been met out of income, no charge is made for interest. The cycle has been carefully ridden, but expense has not been spared in order to avoid breakdowns, inasmuch as belts, etc., have been scrapped when by patching they would have lasted longer. But when one's rides are few, roadside repairs are a nuisance.

COMMANDER, R.N.

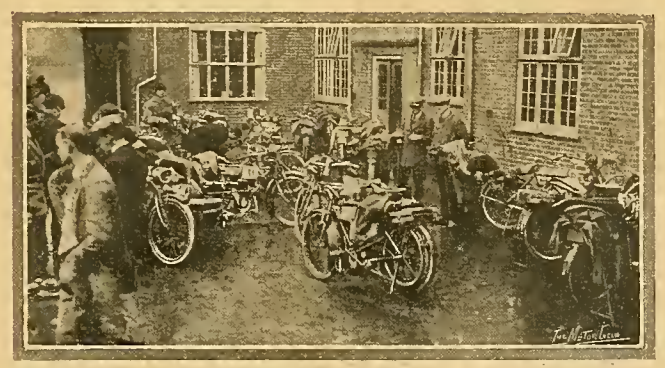
[The above is, of course, a very exceptional case, owing to the short distance run and the number of additions made to a standard machine.—ED.]

Sir,—The comments of your correspondent "C.M." on page 64, January 18th, are excellent, and if every user of a motor cycle would state in his season's riding expense the railway fares saved, I think it would prove to would-be motor cyclists the advantages gained by this method of travel especially to commercial men. I have saved during the period mentioned in my riding expenses of January 18th, page 64, a sum well over £9 in railway fares. In addition to this when I have to travel by train to my business places I have ten miles to walk every time which takes me three hours. In the nine months I should have had to walk 380 miles, which would take a potterer like me, at three miles per hour, about 127 hours, or at twelve hours per day about eleven days: What price shoe leather, time, and extra sustenance? Deduct the £9 saved in railway fares from my total expenses you published and £3 14s. 4d. is left.

Considering the pleasure I have derived and the time I saved for such a small extra outlay, every would-be motor cyclist can form a decision. It would certainly not pay me to become an occasional tramp for such a small outlay. The advantages are obvious; even I can "C.M."

AGAIN A POTTERER.

Sir,—I am sending you cost of running of my 1911 T.T. roadster Triumph, Dunlop tyres, and belts, from January, 1911, to January, 1912. Mileage run, 6,005, of which 2,000 were with passenger on carrier:

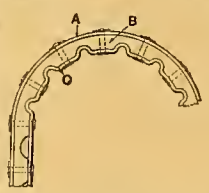


Petrol, 64 gallons, 93½ m.p.g.	£4	8	4
Oil, 2½ gallons, 2,400 m.p.g.		13	2
Tyres, and repairs to same	2	11	9
Belt and fastener		19	0
Carbide		2	6
Licences	1	10	0
Plug		4	0
Repairs to footrest		2	0
Sundries		4	0
Depreciation	12	0	0
	£22	14	9

The above is the cost of running machine, and works out at .81d. per mile. If I add all extras, which have nothing really to do with cost of running, such as lamp, hooter, whistle, speedometer, club subscription, hill-climbs, garages, and tips, the cost is £29 8s. 10d., or 1.18d. per mile. I do not ride slowly, and it is interesting to note the engine has cost me *nil*.

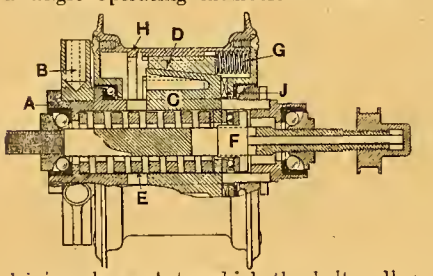
Taking "C.M.'s" hint in *The Motor Cycle* of January 18th, about the saving of train fares, I have saved about £16 on journeys I should have gone even if I had not had a motor cycle.

G. O. BRUNWIN-HALES.



HERTS. COUNTY A.C. QUARTERLY RELIABILITY TRIAL.

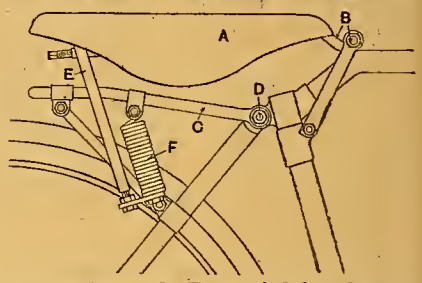
The assembly at the Rose and Crown Hotel, Tring, for the luncheon interval.



A Special Belt.

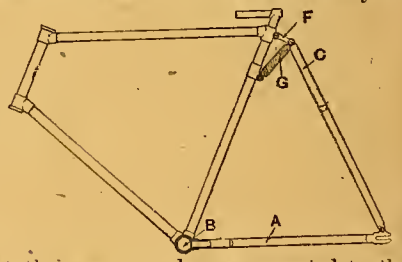
This belt is built up of three members, A, B, and C. Of these, A and C are formed of balata or similar belting, while the middle member B is formed of a rubber composition, affording an effective gripping medium, the members A and C forming a strong non-stretching transmitter. The member B is recessed on its inner face as shown, to enhance the flexibility of the belt.—F. W. Barnes, No. 265, 1911.

A Clutch Hub.



This is an ingenious construction in which the drive is first taken up frictionally, and then positively, the drive in both cases being under control, through a single operating member. There is a driving sleeve A to which the belt pulley is spoked at B, and upon which is mounted a cone clutch member C, co-operating with a corresponding member D splined to the hub shell. The cone C is normally impelled into engagement with the cone D by a spring E, but may be withdrawn therefrom by a push rod F. The cone D is free to slide a short distance in the hub shell, springs G moving it over against a stop H when the clutch is disengaged. The cone C is formed with dogs J co-operating with similar dogs carried on the hub shell. In action when the push rod is operated the cone C is forced out against the action of the spring E, the cone D moving into contact with the stop H. If now the push rod be released the cone C moves into engagement with the cone D, transmitting the drive frictionally to the hub shell. Further, withdrawal of the push rod allows the spring E to move the cone C further into engagement, and ultimately the cone D will be moved, against the action of the springs G, allowing the dogs J to come into engagement, providing a positive transmission.—F. G. Galley and R. M. Brice, No. 1,670, 1911.

PATENTS by Eric W. Walford A.C.I.P.A.



Saddle Springing.

The illustration shows a construction of saddle in which the usual underframe is dispensed with, the seat proper A being supported at the peak on links B connected to the frame of the machine, and at the rear from a light bracket C, secured by the saddle-pillar bolt D. The connection from the rear of the saddle to the bracket C comprises rods E, carried by the tension springs F.—E. Lycett, No. 7,289, 1911.

Rear Springing.

Although this invention is shown applied to a pedal cycle its adaptability to a motor cycle is obvious. The chain stays A are arranged to pivot about the bottom bracket B. The saddle stays C at their upper ends are connected to the seat pillar lug by links F, which permit of movement under the restraint of springs G.—W. Griffiths, No. 6,940, 1911.

Tyre Successes.

In the Herts County Quarterly Trial, three out of four gold medal winners, and the winner of the amateur cup (E. A. Colliver, 6 h.p. Zenith), were mounted on machines shod with Hutchinson covers.

The College Mudshield.

In a recent mention of the College mudshield, made by Beard-Brown and Co., College Street, Northampton, it was inadvertently stated that the headquarters of the firm were at Wolverhampton.

A Tyre for Sidecar Wheels.

The latest Dunlop production is a new tyre for sidecar wheels. It is of the beaded edge type, with longitudinal grooves on the tread, and is made in the regulation size, 26in. × 2½in. The quality is up to Dunlop standard, and in the matter of cost it is cheaper than an ordinary motor cycle tyre.

Moulding and Vulcanising Under Pressure.

The Leicester Rubber Co., Granby Street, Leicester, the makers of the "John Bull" Cross grooved tyres, are exceedingly satisfied with the results of their exhibit at the recent Show. The two cover, which had done 12,000 and 8,000 miles respectively, and were still in good condition, attracted considerable attention. This tyre is actually moulded to the exact shape it would assume when inflated, and during vulcanisation is subjected to the enormous pressure of more than half a ton to the square inch. This renders the tyre of an exceedingly tough quality, and has the effect of forcing the rubber into the foundation.

Another Firm Adopts the Motor Cycle Business.

It is a sure sign of the times when so important a firm as Messrs. Harrods' Stores, Brompton Road, S.W., take up the motor cycle business, the firm having taken the Cadogan rooms, just behind the main building, in which a special room is set apart for motor bicycles and sidecars. In the handsome hall, special displays are being given from time to time. On the occasion of our visit all the chief quadcars on the market were on view, at another time a speciality is made of motor bicycles, while from February 19th to March 2nd the display will consist of sidecar combinations. A point will be made of demonstrating the ease with which the sidecar can be attached and detached. Yet another speciality of Messrs. Harrods' motor cycle department is their deferred payment system, of which motor cyclists are taking advantage in ever increasing numbers. Business is also done in all types of motor cycle accessories.

Melbourne to Sydney Record.

Latest advices from Australia containing details of W. Tormey's remarkable ride from Melbourne to Sydney on his Dunlop-tyred 3½ h.p. Kerry-Abingdon give his time for the 577 miles which divide the two cities as 34h. 7m., beating the previous record by no less than 14h. 37m.

Trade Announcement.

W. F. Guiver has joined the staff of the Haven Motor and Cycle Works, 722a, Old Kent Road, S.E., a company which carries on the motor cycle business in all its branches.

"Model Flying Machines."

Although numbers of motor cyclists are interested in the construction and use of flying machines, it is obvious only a few of them can become flying men, owing to the very great expense attached to the purchase of such machines. Enthusiasts will read with interest the second edition of a book entitled "Model Flying Machines: Their Design and Construction," by W. G. Aston, one of our contributors. This book gives full instructions for the construction of small model aeroplanes of various types, and is illustrated with straightforward sketches and diagrams, which can be understood by anyone who has the slightest knowledge of model making. "Model Flying Machines" is published at *The Aero* Offices, 20, Tudor Street, E.C., and can be obtained from there, price 1s. 2d. post free. We have had ocular proof that models made to the instructions given in the above book will fly.

THE "ROYAL RUBY"

1912 MOTOR CYCLES

TRADE MARK RUBY REGISTERED THROUGHOUT THE WORLD

will be fitted with the following well-known fitments which will make them **second to none**:

J.A.P. ENGINES.
CHATER-LEA FITTINGS.
BOSCH MAGNETOS AND PLUGS.
BROWN AND BARLOW'S CARBURETTERS.
DRUID SPRING FORKS.
BOWDEN FRONT BRAKE, EXHAUST LIFT, AND MAGNETO CONTROL.
DUNLOP TYRES AND BELTS
BROOKS' SADDLES AND TOOLBAGS.
VILLIERS' FREE ENGINE HUB.

Manufactured by

The Royal Ruby Cycle Co., "Ruby" Works,
Great Ancoats Street, MANCHESTER.

Slack's Patent SEWN BELT

Pattern No. 18408.

Anything New?

Yes, the leather motor belt revolutionized with success. Before offering these belts for sale we had them under severe tests for five months for sidecar work, and for hill-climbing in the High Peaks of Derbyshire, and we have had splendid results. The belts have run thousands of miles. They have been well tested on the following makes of machines:—Bat, B.S.A., Triumphs, 6 h.p. Rex, Ariel, and others. All the motor cyclists that have had them write and say they are simply splendid, we are open to give you their addresses and show their letters. The belt is very strong easily adjusted, and will grip well when running slack. This gives more power to the engine. The belt does not need oil, therefore does not pick up grit that wears the pulley. The belt is water-proof and is very pliable—will run round a 1½ inch pulley. The belt has a very handsome appearance. Don't doubt as to what we say, but give us a trial and you will be well pleased. It will save your pocket and a lot of worry. One motorist writes and says he was running over four hours under heavy rain, with sidecar and passenger—journey over 150 miles—and the belt never gave him any trouble. We make the belts in eight widths:—

¾ inch and ⅞ inch, **1/11** per ft. ⅞ inch and 1⅛ inch, **2/1** per ft.
1 inch and 1⅛ inch, **2/2** per ft. 1⅛ inch and 1⅜ inch, **2/4** per ft.

Carriage paid to any part of the British Isles.

Patentees and Makers: **R. SLACK & Co.**, LEATHER DRESSERS,
Chapel-en-le-Frith, DERBYSHIRE, England.

You will never be hung up —

on the road through ignition troubles if you fit the

"U.H." MAGNETO

Gives a perfectly regular spark under all conditions. Short circuiting is impossible with a "U.H." Send for particulars free on application.

CORONET SIDE CARS

WEIGHT *versus* STRENGTH.

You cannot expect your machine to pull a "Hansom Cab" Sidecar weighing 140 lbs. Apart from power required, the strain on the machine would be terrible. We make strong sidecars, weighing 56 lbs., with every comfort and protection, and suitable for 3½ h.p. machines.

MODEL C.—£7 2s. 6d.

MODEL A.—£5 5s.

MODEL E.—£7.

MODEL D.—£7 12s. 6d.

Instructive Catalogue post free, giving illustrations and full particulars of all models of Coronet Sidecars. Every model certain to satisfy and save money for buyers. Full of improvements. Quick detachable joints. Latest car pattern mudguards. Wicker, cane, or coach-built bodies. Child's reversible seat. Excellent upholstery.

NOTE front arm which grips main tube of sidecar, which is the only correct mechanical method—nothing lopsided about this attachment.

Delivery from stock to suit TRIUMPHS N.S.U.'s, REXES, P. & M.'s, BRADBURYS, etc. Discounts to Agents.

TEE BEE LOW SEAT-PILLAR, 5/- each.

THE

1912 REX-J.A.P.

The Motor Cycle You Should Buy!

Several things enter into the success of a Motor Cycle when used for Sidecar work. One of these is the Power and Flexibility of the Engine—another is the Frame—another is the Design—another is the system of Springing—and last, but not least, the Wheels, Rims, and Tyres. Ask an expert to examine the 1912 REX-J.A.P. and he will pronounce it perfect.

Features of the REX-J.A.P. which will appeal to the discriminating Buyer are the

ENGINE—the world-famous J.A.P., with mechanically operated Side-by-Side Valves.

FRAME—Specially strengthened—constructed of double-butted tubes throughout, with brazed-on lugs for Sidecar.

SPRINGING—Efficient Spring Fork (made under "Druid" license), and Spring Cantilever Seat.

LUBRICATION—Automatic, with Auxiliary Hand Pump.

CONTROL—The Rex-Jap can be stopped and re-started on any hill, or in traffic, without taking hands off handlebar.

TYRES—650 x 65 Dunlop Grooved Voiturette Cover on back wheel, and extra heavy 26 x 2½ Studded Dunlop Non-Skid on front wheel.

We shall be pleased to send you Catalogue, describing the many exclusive features of these unique machines, upon request.

AGENTS—We have several districts still open. Write for terms.

COLONIAL AGENTS—Write for prices and Agency Terms of REX-J.A.P. special Colonial Models.

FOR BARGAINS

YOU cannot do better than try

NYE'S

"The Nicest Firm in London"

(Vide a client's letter).

January is proving itself a very damp and dismal month, but such weather has its compensations. Many folks would rather stay at home than come out. In consequence, there are many more BARGAINS to be picked up NOW than when the sun shines. YOU should call, if possible, and see one of our representatives, choose what you want, and we will listen to any reasonable offer or part exchange YOU have to suggest.

If any of the following goods are of use to YOU, call or write AT ONCE.

	Sale Price

Also immediate deliveries of all models of **any first-class make.**

THIS WEEK'S TIT-BIT.

Brand New 1911 Model 3½ h.p. **BRADBURY,** standard model, not shop-soiled or scratched; list price, £48; special bargain; price **£38 0**

HIGH-CLASS SECOND-HAND MOTOR CYCLES.

1911 3½ h.p. **TRIUMPH,** Clutch Model, and practically new, only run about 500 miles, fitted with Lucas headlights, generator, horn, carbide carrier, tools, spares, etc., complete. The best second-hand machine we ever had; cost over £66; clear **£47 10**

1911 **DOUGLAS,** 2¾ h.p., only run 200 miles **£33 0**

1911 3½ h.p. **TRIUMPH,** perfect **£35 0**

1910 3½ h.p. **BRADBURY,** T.T. model, a gift **£32 0**

1911 3½ h.p. **IVY-PRECISION,** lamp, generator, etc. **£33 0**

1911 3½ h.p. **RUDGE,** splendid order **£36 0**

1910 **SCOTT,** new tyres, B.E. tubes, good order .. **£35 0**

1909 **VINDEC SPECIAL,** two speeds, magneto, complete with sidecar **£29 0**

1909 3½ h.p. **MINERVA,** magneto **£17 0**

1911 7 h.p. **SPEED KING REX,** as new **£38 0**

MOTOSACOCHE, 1¾ h.p., 1910, free engine model **£21 0**

1908 **QUADRANT,** 3½ h.p., Bosch magneto, h.b. control, spring forks **£18 0**

Every Motor Cyclist should have OUR Sidecar List.

STANDARD, £4 10s. SPECIAL, £5 5s.
DE LUXE, £6 6s.

CANOELET, DUNKLEY, MILLFORD, etc., supplied to order promptly.

I am Sole District Agent for—
RUDGE, BRADBURY, CLYNO, ENFIELD, CENTAUR, PREMIER, ROVER, B.S.A., DOUGLAS, NEW HUDSON, SINGER, and JAMES.

And can also supply
TRIUMPH, ZENITH, SCOTT, MATCHLESS, F.N., HOBART, etc., at lowest prices.

200 1912 MODELS FOR GUARANTEED DELIVERIES.

OUR SPECIALITY, "EXCHANGES"

Extended Payments arranged for any machine at slightly increased cost.

N.B.—You cannot possibly have got the best terms for any machine unless you have been in touch with me. Write at once to "the recognised North of England Motor Cycle people."

MOTOR BICYCLES FOR SALE.

1912 Motor Cycle Deliveries.—Zenith January, Kerry-Abingdon January, Calcott lightweight January, Rover February, New Hudson February; sidecars and second-hand machines always in stock; exchanges entertained; send for catalogues.—Dundee Motor and Cycle Co., Nethergate, Dundee.

SECTION XI.

Ireland and Isle of Man.

3½ h.p. Rex, 2-speed, £20; 2h.p. Motosacoche, magneto, £12.—119, Donegall St., Belfast.

ROYAL Enfield Motor, 2¾h.p., new last August, fresh condition, splendid hill-climber; bargain, £30.—Ruddell, Ballymena.

MOTOR TRICYCLES AND RUNABOUTS.

ORLEANS Runabout, 2 speeds, Dunlops, low, comfortable, good condition; £20, or offer. — 290, Ewell Rd., Surbiton.

1911 10h.p. Bedelia, used for demonstration, hood, screen and lamps; any trial or examination; £85, or offer.—Dan Guy, Weymouth.

CRESCENT Runabout, 1911 model, only done about 300 miles, new condition; trial in Birmingham (by appointment); £80.—Harman, 235, Charles Rd., Small Heath, Birmingham.

QUADCARS.

DUOCAR, twin water-cooled Fafnir, 2-speed, reverse, centre chain drive.—"Albacore," Inverness Av., Westcliff-on-Sea.

MONOCAR, 8h.p., coach-built body, water-cooled, Buchet engine, 3 speeds, wind screen; £35; photo and particulars.—Dr. Wilson, Louth.

TRAILERS.

MILLFORD Motor Trailer, good condition; cost 11 guineas, sell 30/-, genuine bargain.—Andrew, 22, Montague Rd., Richmond.

TRICARS FOR SALE.

TRICAR (Humber), excellent condition; £10.—Field, Motor Works, Camberley.

LIGHT Tricar, 3½h.p. Humber, 2-speed, free; £10, or exchange.—Franklin, draper, Kingston.

TRICAR, 10h.p. Rexette, £25; exchange car, cash adjustment.—105, Church Rd., Willesden.

A.C.U. Owners should write Bass, Insurance Broker, Bishop's Stortford, for particulars of special policies

4½ h.p. Riley, 3½h.p. Triumph: £10 to clear.—Stamford Hill Motor Co., 128, High Rd., South Tottenham. 'Phone: 1982 Tottenham.

5-6h.p. Twin Tricar, perfect condition, tyres brand new, B. and B., h.b.c.; 100 miles trial given; £20.—Marines, Netheravon Rd., Chiswick.

HUMBER Tricar, 3½h.p., mechanical condition, faultless, good tyres and tubes, belt drive; £15, offers.—Oseman, Ashmounts Stables, Redington Rd., Hampstead, N.W.

TRIMO Forecar, 5h.p., twin Bercley, Bosch magneto, 2-speed, pedal clutch, handle starting, Palmers, first-rate condition; any trial; £16, or offer.—C. J. Lander, grocer, Ryde.

A.C. Speed Sociable, 1910 model, hood, screen, front brakes, lamps, generator, horn, spare covers, butt-end tube, tool kit, and accessories; price £70.—Salisbury, Gable End, Harpenden.

SOCIABLE 9h.p. Twin Riley, w.c., 3 speeds, reverse, wheel steering, hood, wind screen, good tyres, spares: £37, or exchange; trial, appointment.—Edwardes, 92, Camberwell New Rd., S.E.

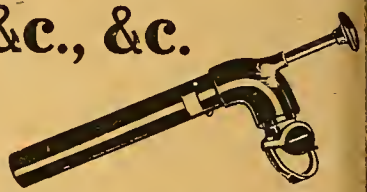
4½ h.p. Rover Tricar, w.c., wheel steering, coach-built, 2 speeds, etc., 1911 B. and B. fitted, just been overhauled at cost of £9, good tyres; any trial; £18.—Sidney Jeffery, The Hill Farm, Exning, Newmarket.

5 h.p. Wolf Tricar, water-cooled, 2 speeds, gear box, clutch, chain drive, handle starting, thorough good condition; cost £75, bargain £26, or exchange with cash for runabout.—4, Alexandra Gardens, Muswell Hill, N.

4½ h.p. Water-cooled Stevens Engined Sociable Tricar, beautifully upholstered, wheel steering, 2 speeds and free, car control, three new tyres, three lamps, all equals new; £35; buying car; photo, particulars.—Matthews, Southam, near Rugby.

SIDECARS AND FORECARS.

SIDECAR, with Palmer cord, nearly new; £4/10.—G. Walker, Birchington, Kent.



£3/10.—Chater-Lea sidecar, run 50 miles; sacrifice.—Hart, 206, London Rd., Twickenham.

GIRDER Frame Sidecars, unique designs, from £8.—F.N. Repairs Dept., Highbury Barn, N.

MILLFORD 1911 Art Cane Sidecar, and good spare tyre; £6/10.—15, Ranelagh Gardens, Barnes.

SIDECARS, brand new, beautifully upholstered, fit any make; £3/10.—Rey, 5, Heath St., Hampstead

Who will Adopt the Quadcar?

THE light form of motor car built on what is known as motor cycle lines is undeniably a motor car. It is recognised by the Government as such, as it is compelled to carry car numbers and to be registered as a motor car. The law does not define a motor cycle, but the Local Government Board does in a rough and ready sort of way by inferring that a motor cycle may not exceed 3 cwts. nor have more than three wheels. Now a quadcar can have no less than four wheels, and is difficult, if not impossible, to keep within the weight limit, and it is therefore practically certain that it conforms to neither of these conditions. A motor cycle is a motor car within the meaning of the Motor Car Acts except as regards registration, licensing, and carrying rear lights. It is absolved from having big number plates, car registration fees, a reverse, and so forth. [The L.G.B. in an order made in March last year exempts all motor vehicles from a reverse gear provided they did not exceed 7 cwts.] Since this is so, why is the Auto Cycle Union asked to encourage trials for a type of vehicle which is clearly not under its ægis? It is in our opinion indisputably the duty of the Royal Automobile Club to work for the development of these machines. They are cars, and in consequence they should be looked after by men who know what is to be expected of four-wheeled vehicles. The Auto Cycle Union has enough to do with its motor bicycle and motor bicycle and sidecar trials without worrying about what does not strictly concern it. The R.A.C., on the other hand, has not organised a road trial in which several makes of vehicles competed at once for some time, and therefore there is all the more reason it should do so now a new type of motor car has appeared. To build a cheap motor car is the very easiest thing in the world, but to make it good and lasting is an altogether different matter. Should the R.A.C. fall in with our suggestions and organise a trial for these machines and find observers, the quadcar industry would receive a fillip of which its members have not yet even dreamed, and by the end of the year we should have a light and cheap four-wheeler of which we might be justly proud. In the event of the R.A.C. ultimately deciding to take the quadcar under its wing, it ought to do more than say it will look after the new vehicle. Suitable trials should be at once arranged. It would be better for the A.C.U. to take up these vehicles at once and allow them to participate in the motor cycle trials, but in a separate class, than for the R.A.C., after undertaking to protect their interests, subsequently to neglect them. This journal will do all it can to encourage the quadcar at present by describing different makes and reporting their doings, even though the A.C.U. does not encourage their development. But if the A.C.U. has not, the Manufacturers' Union has seen the matter in the same light as ourselves, as quadcars were not accepted in the Olympia Motor Cycle Show.

To make a start, why doesn't the maker of a quadcar enter one of his vehicles for a R.A.C. trial? All he has to do is to write to the R.A.C. Technical Secretary, Pall Mall, S.W., and state that he wants his machine tested under observation, when he will receive full particulars. He may suggest any sort of test which occurs to him, and, if he gets through, the world at large will know that his performance is hall marked in such a manner as to leave no shadow of doubt as to its worth.

A Week-end on a Sociable.

AN account of a week-end extending over Saturday and Sunday would doubtless be interesting to the users of the popular A.C. sociable, who by this time should be somewhat numerous, judging from the numbers to be seen on the road. It might also be of some use to the pace purveyors who sprint about the country on a raging 7 h.p. monster with a skeleton of a sidecar attached and a palpitating passenger ensconced therein.

The machine is one of last year's pattern, not fitted with a hood or screen, but provided with the substantial carrier supplied by the makers. This carrier, by the way, is perfectly capable of taking a second passenger if a board be made to fit over the bars of which it is made and the same provided with a cushion. The passenger sits sideways, and I am told that it is quite comfortable in spite of the fact that there is no support for the back. The effect of this attachment on the machine is only appreciable on hills, and that to a very small extent—on the level there is no appreciable lowering of the speed, but, on the other hand, a considerable steadying effect on the steering.

Improvement to Carburetter.

Another deviation from standard has been made, this being the conversion of the automatic carburetter to semi-automatic. Users of the A.C. will know that the air supply of the carburetter is regulated by a choke tube which moves up and down with the throttle, so that with a larger opening of the throttle there is a corresponding increase in the air supply. I found that with the throttle almost shut on a down grade the engine did not get nearly enough air, whereas when open to the full extent on a hill it got too much when running slow, necessitating recourse to the low gear to obviate knocking. I have now made the choke tube a sliding fit in the throttle barrel, and can regulate its position therein by means of an ordinary Bowden lever and wire. As a result the carburetter is just as automatic as ever, with the added advantage that I can regulate the air when a perfect mixture is of importance. Another improvement I have fitted to the engine is an exhaust lifter made from a stout strip of wrought iron and actuated by means of a Bowden cable and a small pedal. This attachment enables me to coast down any hill of a moderate gradient and to start the engine up at the bottom, to say nothing of the advantage of being able to start the engine without cranking. Of course for this last a pusher other than the driver is necessary, but as the engine can be started on top gear at a pace not more than four miles an hour this is no great hardship for the passenger, to whom this duty is relegated as a rule.

To return to the tour. We started at 10.30 a.m. on the Saturday, and soon arrived at Fareham. Here we adjusted the clutch, a very simple matter—one of giving a half turn to three screws with a pocket-knife. One cannot give the A.C. clutch too much praise. It can be slammed in without any injurious effects, and one is able actually to change up on a hill from a low gear of 12½ to 1 to a top gear of 5 to 1.

We speedily made our way to Romsey at an average of 20 m.p.h.; in fact, we did one mile at an average of twenty-five, and that over a road none too good. After leaving Romsey we had to climb a hill which proved too much for our little jigger's top gear, although we managed to get very near the top. The low gear was then engaged, and we caught up and passed a car which was rattling up on its first speed.

The New Forest Roads.

The run through the New Forest was marred by the awful pot-holes, the road being one stretch of holes, with the unfortunate back wheel hopping from one summit to the other, making things somewhat uncomfortable and necessitating a reduction of the speed to about seventeen miles an hour. The scenery was as usual fine, as anyone who knows the district is aware, and we thought it would be a good idea to discuss the sandwiches and fruit we had brought with us. We gathered here some holly with plenty of berries on it, and I believe this is held to be a sign of a coming hard winter. After an inspection of the Rufus Stone (an iron box enclosing the remains of the stone), we put on speed and glided along with the engine doing its 1,300 revolutions per minute quite comfortably. As we did not want to pass through Poole with its watered tramlines, we turned off at the fork to Wimborne, and ultimately came out on the other road to Poole. Turning off once more, we ran on at a spanking pace to Wareham, that quiet little town on the Frome, but not so quiet in the days of the Civil War, when the inhabitants proved such thorns in the sides of the Parliamentarians who were busy at Corfe Castle demolishing it that it was seriously considered whether it would be advisable to raze the town to the ground. The town, although of only two or three thousand inhabitants, rejoices in a Mayor and Corporation, relics of the days when it was a seaport.

We had originally intended to stay at West Lulworth for the night, but as there was still plenty of daylight we decided to go on to Weymouth and see what sort of a place it was. The road from Wareham to Weymouth is not of the best, and so our attention was practically confined to steering the tricar over the pot-holes. Our pre-occupation was not so great

A Week-end on a Sociable.—

that we missed the white horse on the hill above Weymouth or the blackberries growing in the hedge. The berries were absolutely the best I have ever tasted, being quite as large as raspberries, and some with a flavour quite unlike what one had been used to. Weymouth proved to be the usual sort of seaside place, so we did not stop, but, after perambulating the town with the engine just working on top gear, we ran on to Portland, the A.C. taking the hill out of Weymouth in fine style.

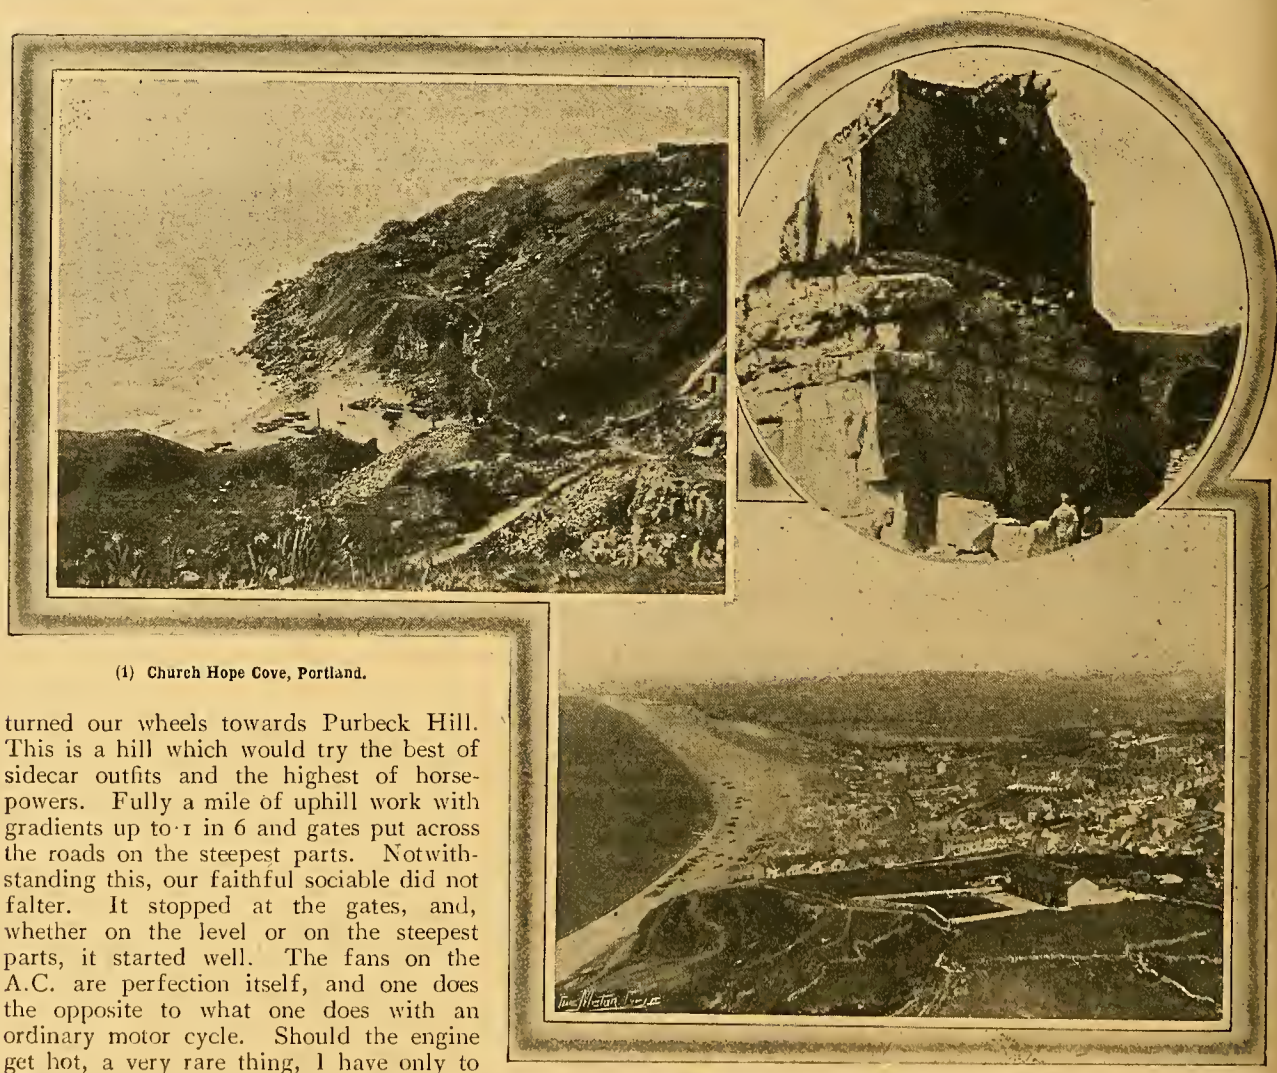
The Evening at Portland.

The road along Chesil Beach is one of the best I have met with in the South of England, the surface being

The White Horse, near Weymouth.

hard macadam and quite fit for a speed trial; in fact, we were told by the only visible representative of the civil power at Portland that he had timed a car over the whole length of the road in two minutes. Risking arrest as German spies, we took several photographs of the harbour and the citadel, and proceeded, as it was getting dark, to Fortune's Well, the little town at the foot of the rocks. While prospecting for an hotel, we came upon a street with something of a rise and put the engine at it. On the low gear, with the engine steadily beating and the chain giving its musical purr, we went up that piece of 1 in 5 as though it were not there, what time the inhabitants rushed out to their doors to see what manner of motor this was to tackle that street. Finding no hotel to suit us, we ran to the bottom again, and ultimately put up at the one in the square, where we soon had a wash and a good meal. The main street of Fortune's Well has itself a gradient of 1 in 4 for some little distance, and leads up to the top of Portland Island. We followed this road, and after much climbing found ourselves in the region of the citadel. There being nothing much to see owing to the darkness and feeling cold owing to the breeze which had sprung up, we retracted our steps, and, after taking a different course, found ourselves overlooking the town, which had the appearance of a fairy garden with the lights twinkling far below. As we sat there, very distinctly came up the strains of the Salvation Army Band, though somewhat softened in tone and consequently more acceptable. We could hear, also very distinctly, the people talking in the streets and see the lights of Weymouth in the distance. On the following morning, after we had discharged a very reasonable bill (11s. for the two of us, including rooms, meat supper, and breakfast, and accommodation for the tricar), we sallied forth once more to see if we could do the High Street. This was easily accomplished on the low gear, and we sought fresh hills of a similar calibre (1 in 4). These we could not find, there being none, so we went on and explored the island, which appears to be simply one mass of quarries and not a patch of anything else. one mass of quarries and not a patch of anything else.

A Pretty Cove.



On our way round the Bill we came upon a road marked "To Church Hope Cove." We decided to investigate, and, when too late, found that the road was merely a path leading down on to a platform of rock overlooking one of the loveliest coves I have seen. The path went down beside a tower perched on a huge rock looking out over the Channel, and was probably in its day a watch tower. We took several photographs here, and with some labour turned the tricar round and got on to the road again. Having seen as much of Portland as we wanted to, we returned along Chesil Beach to Weymouth, where petrol was

Lulworth Cove. Famous years ago as a smugglers' retreat.

A Week-end on a Sociable.—

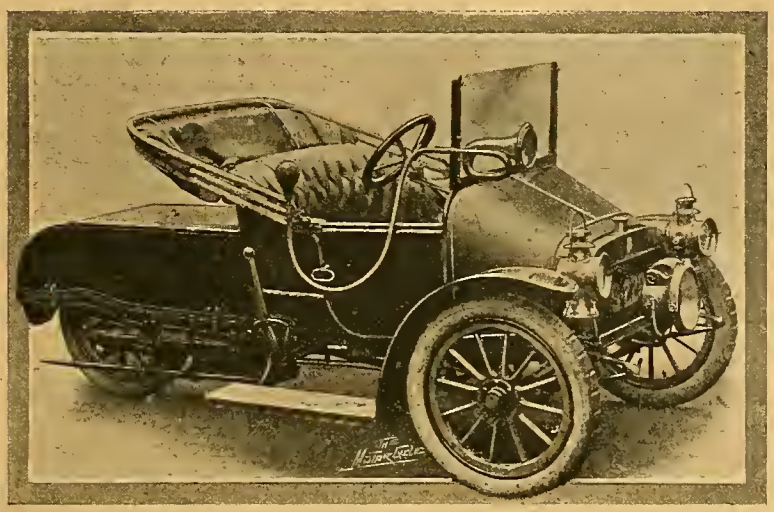
taken in, and a long conversation ensued with another owner of an A.C. Having compared notes with him, we departed for West Lulworth. On the way there a Douglas and a Triumph passed us, and we immediately gave chase, holding on to them until we came to the turning for Lulworth. Here we lost our way, and after much perambulation of narrow lanes with bad surfaces and the opening of many gates, we arrived at the cove. We did not stay here long, but turned our wheels towards Purbeck Hill. This is a hill which would try the best of sidecar outfits and the highest of horse-powers. Fully a mile of uphill work with gradients up to 1 in 6 and gates put across the roads on the steepest parts. Notwithstanding this, our faithful sociable did not falter. It stopped at the gates, and, whether on the level or on the steepest parts, it started well. The fans on the A.C. are perfection itself, and one does the opposite to what one does with an ordinary motor cycle. Should the engine get hot, a very rare thing, I have only to give it a few hundred yards of low gear work, and it is ready to change up again.

(1) Church Hope Cove, Portland.

(2) The watch tower at Church Hope Cove, Portland.
(3) Fortune's Well and Chesil Beach, Portland.

Purbeck Hill and Corfe Castle.

The view from Purbeck Hill is grand, extending for miles to the landward and affording splendid views of the rock-bound coast. Proceeding down the hill and along the valley for some distance, we came upon Corfe Castle, perched in solitary but magnificent ruins on the summit of a huge mound between two ranges of hills. The work of the Parliamentary sappers is clearly visible in the fantastic angles assumed by some of the towers and the huge fragments of masonry at the foot of the mound. In its day the Castle must have been a very tower of strength.



The road back to Wareham is splendid—smooth, wide, and straight. From Wareham we went on to Christchurch, skirting Bournemouth, and thence to Lyndhurst.

From Lyndhurst onwards we had no trouble at all, and made a good average of 20 m.p.h. for the distance. We arrived at Portsmouth just before lighting up time, having had one of the best times of our lives. Beyond adjusting the clutch once and changing the valve caps round to stop misfiring we had no trouble whatever. This speaks well for a machine scaling upwards of 7 cwts. with two up and baggage and an engine only 90 mm. × 102 mm. The reason why the caps were changed was because I was experimenting to see what effect having the plug over the exhaust had. I found that there was some missing at any speed and rather more when the throttle was open on hills. Perhaps a tour over the ground we covered would convince some of the single gear merchants that some form of change-speed gear is desirable if a strenuous course of hard work is to be avoided.

"AIR-COOLED."

A Run on the C.M.C. Carette.

IT was a cold, frosty day with a fine powder of snow falling; consequently it was with somewhat mixed feelings that we accepted Mr. Crouch's offer of a run on one of his little three-wheelers. The machine we tried was a low, grey, rakish - looking vehicle about to be delivered to a customer

A 6-7 h.p. C.M.C. Carette fitted with hood and screen.

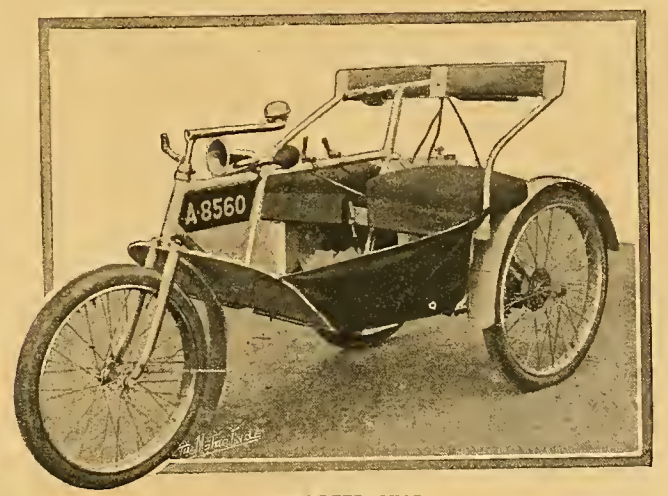
The twin-cylinder water - cooled engine started at the first pull over of the handle, and we slid away, getting into top speed within twenty yards of our office. The first thing to strike us was the silence of the machine, only a slight "puffle" from the exhaust being audible. Other slight noises, such as chain rattle and valve clicks, seem to flow away behind, and do not worry the passengers.

Later on we traversed some bad road surfaces, and were agreeably surprised at the absence of shock, even bad pot holes being passed without discomfort. Though we were never in need of the lowest gear, Mr. Crouch dropped down to first and second to demonstrate the quietness of the gear box, and even on reverse no unpleasant noise was noticed. Once we stopped to exercise ourselves to get warm, and employed our time in looking round the power unit. Here we noticed several minor improvements, the most important of which is a neat metal guard which prevents mud being thrown on to the engine and transmission.

Restarting, we ascended a steady rise on top speed with the engine pulling well at slow speed.

Two important points struck us particularly, viz., the absence of roll, so common in tricars, and the particularly easy steering. The latter is carried out by means of a wheel connected to a simple rack and pinion gear carried high up out of the mud and dust.

Altogether we were delighted with our experience and the behaviour of the machine. The engine ran faultlessly throughout, and the smooth action of the clutch and brakes and absence of vibration are points which have left us with an excellent impression of the C.M.C. Carette.

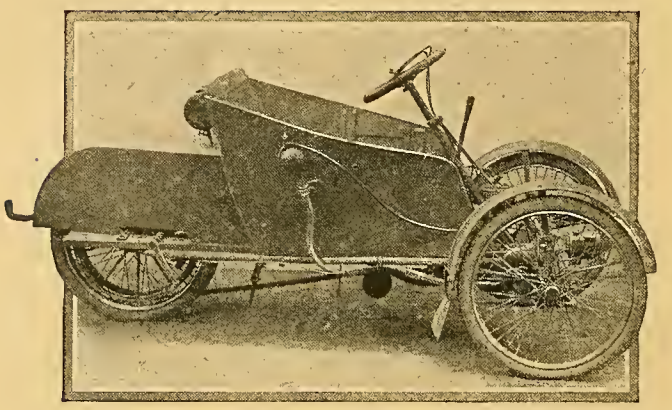


A Converted De Dion Quad.

THE photograph shows one of the original De Dion quads that has been converted to an up-to-date two-seated runabout by a Catford motor cyclist, the alterations being carried out entirely by himself at a small private workshop.

The original De Dion engine, transmission, tanks, wheels, and even frame tubes and lugs were used. In place of the quad seating and steering, however, two side-by-side seats with a single steering wheel are provided. Two push-pedals are fitted. One pedal operates the band brakes and the other the throttle of the Dion carburetter. The ignition and air levers are fitted handy to the driver on the top tube. The exhaust lifter is fitted at the end of the long tiller, and the machine can be steered from either seat! It is said to be considerably lighter than in its original form.

Although a free engine would be an improvement, its owner states that it is not absolutely necessary, the engine being tuned to start fairly easily. It is in regular use, and is considered quite satisfactory for a runabout, and even with a passenger will climb a good many hills under favourable conditions, the gear being about 7 to 1.



The engine and gearing appear to be in very good condition, and the machine is not so noisy as some bicycles. There is a space under the seats for carrying tools and spares, and the whole machine is finished aluminium colour.

A CONVERTED QUAD.

This makes a handy little runabout which can be steered from either seat.

A Light Three-wheeler.

A Converted Tricar.

WE illustrate on this page what is probably the lightest side-by-side seated three-wheeler on the road. It was originally a tricar, and in this condition saw much service. The owner, however, who is a Triumph tester, realising the sociability and comfort of side-by-side seats, converted the machine as depicted in the photograph, using the old tricar frame. Naturally on such a frame the body is not a wide one, the passenger and driver having, in fact, to squeeze into position, which after all is not such a disadvantage this cold weather! The engine is a 3½ h.p. air-cooled on standard lines, and drives through a long Whittle belt, a hub plate clutch being fitted in the rear wheel. Though only a single gear is employed, the machine carries its double load quite satisfactorily on ordinary roads. The long lever noticeable in the photograph actuates the clutch.

Definition of Quadcars and Runabouts.

AS we have already announced, the Motor Cycling Club has decided to award two silver cups in the London-Edinburgh run—one for the best performance on a motor cycle and sidecar, and one for quadcars and runabouts with three or four wheels. The committee is undecided respecting the definition of a quadcar or runabout, and no wonder. It is extremely difficult to differentiate between quadcars, runabouts, and the smallest types of voiturettes by a written description. In other words, if one attempted to define the quadcar by any other method than weight and price, we think it would result in considerable confusion. With a view of arriving at some definite opinion respecting the weights of those quadcars and runabouts already on the market, we have been in communication with some of the manufacturers of these machines, and below are the stated weights of their vehicles when unladen, *i.e.*, without petrol, oil, and spares, but otherwise ready for the road. The average weight of fifteen different vehicles works out at 5 cwts. 1 qr.

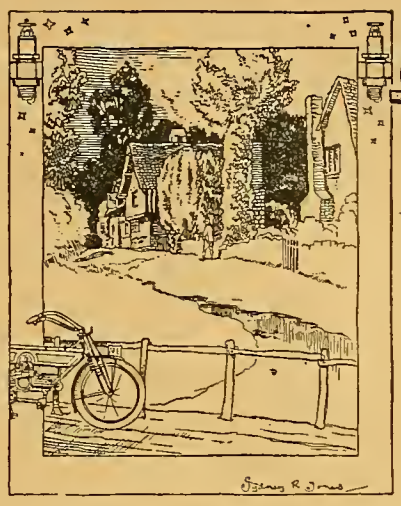
Morgan Runabout, with hood and screen, lamp, tools, and large tyre	3	3	0
Phänomobile (two seater)	5	2	0
P.M.C. Runabout	5	1	0
Rollo Quadcar	6	0	0
Sabella Runabout	4	3	0
Tyseley Runabout (three wheels) ...	6	2	0
,, ,, (four wheels) ...	7	1	0

We therefore reiterate that the definition of a quadcar or runabout with three or four wheels should be of one weight and price, and that vehicles exceeding 600 lbs. and £100 should not be eligible for the special awards.

We do not see any other way out of the difficulty, and we think that a weight definition will act beneficially in many ways. Manufacturers whose machines are slightly in excess of the defined limit will receive an incentive to reduce the weight of their machines, and also to simplify them and thus reduce the price if they should be listed at over £100. However, it should be made quite clear in the regulations for the above event, and similar competitions in which special awards are made for this type of vehicle that they must be of the standard type, and that no reduction of weight must take place by the removal of any portion of the essential equipment of the vehicle, that is to say, the standard body, wings, etc., as supplied to the public should be fitted, but unless the vehicle is supplied with hood and screen as standard the weight should be reckoned without these accessories.



In fixing a weight limitation it is, of course, necessary for each vehicle to be weighed either at the start or close of a competition, which somewhat complicates matters, particularly as the London-Edinburgh entry is always a large one, and the officials have as much as they can do to control the competitors.

Another view of the light three-wheeler referred to above.

Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Counter-shaft Two-speed Gear.

(1.) I should esteem it a favour to have your opinion of Bowden counter-shaft two-speed gear for my 1912 Triumph with sidecar. I have a reliable machine and do not want to spoil it. (2). Do you think the Bowden will be quite reliable? (3.) Is there any danger of slipping on top or low gear on steep hills with sidecar?—J.E.C.

(1.) We have a high opinion of the gear mentioned in your letter, and think it would suit your purposes admirably. (2.) There is no reason why it should not be reliable. (3.) If properly adjusted there should be no slipping.

A Long Exhaust Pipe.

I intend to replace my present exhaust pipe and silencer by a long exhaust pipe only, flattened at the end. (1.) What should be the length of the pipe, engine 240 cubic centimetres, and pipe must be ¾ inch internal diameter, and to what size should I flatten the end of the pipe? (2.) Is copper a suitable metal for the pipe? (3.) How should I set my exhaust valve (automatic inlet) for greatest hill-climbing power (not speed)? (4.) What is the best amount of opening for the inlet valve? —C.H.L.

(1.) The length of the pipe should be from the exhaust port to the rear axle, or just beyond. The size, of course, is regulated by the diameter of the exhaust pipe. Flatten the end to about ½in. (2.) No, copper is not suitable; steel is better. (3.) Set the exhaust valve to close dead on the top of the exhaust stroke. (4.) The inlet valve should open about 3-32in.

When to Retard Ignition.

Am I right at slowest speed, four to six miles an hour, keeping ignition lever on tank fully advanced always on a 1910 f.e. Triumph? I believe this agrees with makers' advice, but a local engineer suggests that at slow speeds a fully advanced spark is more strain on engine bearings than a retarded one. Would this be so, and why? Personally, I ride always fully advanced at all speeds and hills. Excepting when using sidecar up a steep hill, I never retard spark, and then it is usually the last thing I do, reducing air first. Is this right, or would you say retard spark lever at commencement of a hill when using sidecar? I should like to know the reason for or against advanced lever position at slow speeds, so that I can appreciate its effects on the bearings of engine, etc.—A.I.M.

It is quite true that at slow speeds the fully advanced spark is more strain on the engine bearings, as the explosion is taking place prematurely, and the piston has often to work up against its force. This is more especially true in the case of accumulator ignition, but, as the intensity of the magneto spark varies with the speed, the comparatively feeble spark producing slower combustion causes the magneto to have an automatic retarding effect. On the other hand, if the magneto is set in at all an advanced position, it is not advisable to drive with full advance at slow speeds. If you can do so without the engine knocking, it simply means that you lose efficiency by not being able to advance the spark more when you are travelling fast. However, the setting of your spark may be quite correct for ordinary purposes, and we should not advise you to alter it.

A New Carburetter.

I am writing to ask your opinion on an entirely new carburetter. I may say that after a great deal of experimenting I have succeeded in making one as follows: Petrol controlled from handle-bar or on carburetter separately, and it may be cut right off or otherwise, either way, and it is fed by gravity or pressure. The petrol lever on handle-bar opens an extra air valve if desired. There is no possibility of petrol blowing back. It is perfectly automatic after being set to suit any engine, and engine may be driven on throttle? There are no sticking valves, and it has a straight way through. It has given marvellous results fitted to a 5 h.p. T.T. Matchless. At the present moment the above carburetter reposes quite out of sight in one of my waistcoat pockets.—J.H.W.

We are very much interested to hear about your carburetter, and we shall be very glad to receive details and drawings. If you protect the article, which will cost one guinea, we could publish full details if we consider it would prove to be of general interest.

Miss Welstead (driving) and Mrs. A. G. Alsford, both members of the Bournemouth Motor Cycle Club, on a 3½ h.p. Scott with Millford sidecar.

Twin v. Single.

(1.) Is a 6 h.p. twin motor cycle as reliable as a 3½ h.p. single, both machines being fitted with change speed gears? Also shall I be courting trouble if I purchase a twin? (2.) I require the machine for sidecar work, and intend having a 6 h.p. Zenith.—G.W.S.

(1.) A twin is practically as reliable, but slightly more complicated than a single; in the hands of a careful driver there is no reason why great satisfaction should not be obtained therefrom. In fact, for sidecar work we consider that a twin is superior. (2.) We should say that the 6 h.p. machine referred to in your letter would suit your purpose admirably.

Foot Starting and Half Compression.

I am a rider of a 1911 3½ h.p. free engine Rover (Triumph free engine hub), and as I ride in all weathers, and have had some considerable trouble owing to the free-wheel of the pedal gear working full of dirt, etc., and refusing to act. I am anxious to fix a more satisfactory means of starting, and also to convert my machine into a two or three-speed one (1.) Do you advise a counter-shaft gear or an Armstrong three-speed hub? (2.) What makers market a counter-shaft gear suitable for fixing to any make of machine, and which is in your opinion the best and least liable to accident from back-firing in the engine? (3.) Do you consider the Amac half-compression device a useful addition to a machine?—G.E.M.

(1.) Either a good counter-shaft gear or the Armstrong three-speed gear would suit your purpose. (2.) Messrs. Bowden Wire, Limited, 37, Pratt Street, Camden Town, N.W., make a good counter-shaft gear which incorporates a foot-starting device. (3.) Yes, we consider the device in question to be useful.

Sidecar Requirements.

I contemplate purchasing a sidecar combination and am attracted by a well-known 6 h.p. twin, 77½ × 95, capacity 896 c.c., belt driven. I have no desire whatever for high speed, and do not anticipate having to climb freak hills, but I want to take a substantial and comfortable sidecar. (1.) Would this machine, which is fitted with a long exhaust pipe to rear, be quiet when driven at 15-18 m.p.h.? (2.) Would it be more silent at this speed than a 3½ h.p. single and sidecar? (3.) Would such a high-powered machine run easily at slow speed, and be simple to handle? (4.) What should be the petrol consumption compared with that of a 3½ h.p. single and sidecar? (5.) Would the belt drive be satisfactory for the slow speed named? (6.) Judging by the capacity, surely the machine is more than 6 h.p.? (7.) Would you recommend a less powerful machine in view of my desire for silence, moderate speeds and comfort?—W.M.S.

(1.) The machine would be quiet at low speeds. (2.) It would be more silent than a single cylinder. (3.) Yes. There would be no difficulty about driving at slow speed. (4.) The petrol consumption would be about twenty to thirty miles less to the gallon than a single cylinder, say 50 to 60 m.p.g. (5.) The question of belt or chain drive is a matter of personal choice, but we lean towards the chain for passenger work. (6.) The machine should develop 9 h.p. (7.) We should recommend you to adhere to the machine mentioned, as it is a comfort to have a little power in hand going up hills.

Detachable Wheels for Motor Cycles.

A friend of mine has shown me an invention which he recently patented. I was contemplating joining with him in the exploiting of the patent if I could come to terms with him. However, before doing this I should like to know your opinion as to whether the idea is new, or whether from your experience you can say the idea has been previously adopted. The invention is in connection with the construction of the hub and axle parts of wheels for motor cycles and sidecars, whereby any wheel can be interchanged so that the front wheel may be put at the back or *vice versa*. One of the chief points is that it can be done in a couple of minutes, and that the change does not interfere in any way with the driving wheel or the brake bands attached to the back wheel. These remain absolutely rigid. The idea also renders practicable a spare wheel for bicycles and sidecars. The invention seems to me exceedingly practicable, and has been used by the inventor for several weeks, and the cycle has covered many hundreds of miles. If the invention is good on account of its novelty, I think it has great prospects of success, but as you are conversant with the details of motor cycle inventions, I should be obliged if you would let me know whether in your opinion there is any danger of prior inventors claiming to have utilised the idea.—G.H.H.

We should say that a device of the type mentioned in your letter would be most desirable, and would be worth exploiting. We do not think that the patent has been anticipated, but to find this out definitely you would have to put the matter in the hands of a patent agent and have a proper search instituted. We are very much interested by the idea, and shall be glad to hear further details as soon as you can conveniently send them.

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"T.A." (Burnley),—2¼ h.p. and 5-6 h.p. F.N. Reliability of clutch and shaft transmission.

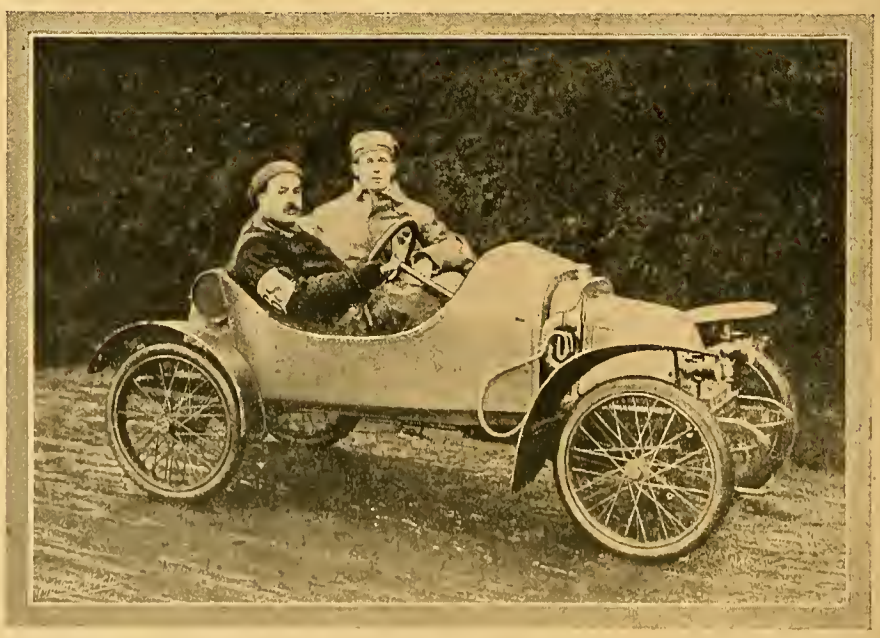
"H.H.T." (Melton Mowbray).—2¾ h.p. Enfield and 2½ h.p. A.J.S. Two speeds and free engine.

"W.E.H." (Salisbury).—Casso and other decarbonisers.

"P.W." (North Finchley).—3½ h.p. Zenith-Gradua with sidecar.

"A." (Waltham).—Mabon variable gear fitted to 3½ h.p. machine; with and without sidecar.

"J.D." (Cardiff).—Albion two-speed hub and free engine clutch.



"J.W.S." (Chislehurst).—3½ h.p. and 8 h.p. Campions.

"J.E.M." (Stonebroom). — 3 h.p. Lincoln-Elk clutch model.

"R.E.H." (Stafford).—Binks carburetter, easy starting, and steady pulling with 7-8 h.p. motor cycle and sidecar, reliability and consumption.

"G.S." (Ilford).—Armstrong and Bowden gears with 3½ h.p. and sidecar.

"F.J.S." (Willesden).—P.M.C. motorette for all-weather use by commercial traveller.

The Ponette quadcar with M. Averies Ponette at the wheel. This miniature four-wheeler has a water-cooled single cylinder engine of 7 h.p., and is of smart appearance. It was described in detail in our issue of November 30th, page 1331.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

How to Exhibit a Badge.

Sir,—Referring to the paragraph recently published on position of an A.A. badge on a motor cycle, I suggest that the front number plate is the best place for the badge, as it is quite clear of other things, is illuminated by the lamp, and is easily fixed with two bolts through the number plate. P.

The Manufacturers' Union and Misleading Advertisements.

Sir,—The Advertising Committee of this Union are aware of the damaging effects to the trade, and particularly to the retail trade, of misleading cycle and motor cycle advertisements in the "Wants" columns of the daily press, in which cycles are falsely described and fictitious values quoted, whereby the public are deceived.

The Advertising Committee will be much obliged to receive instances of such misleading "Wants" advertisements from any cycle agent or interested party, with a view to vigorous measures being taken to bring the offending advertisers to justice.

Communications should be addressed to the Secretary, Masonic Buildings, Coventry. ALF. BEDNELL.

Winter Runs.

Sir,—In answer to Mr. Kimber's enquiry in the issue of January 25th, regarding the condition of riders of A.C. Sociables and similar machines in the Exeter run, I think my experience may be of interest. Although not a competitor in the Exeter run, I undertook quite as bad a journey from the point of view of rain, snow, and filthy roads.

I took delivery of a new machine at the works of Messrs. Auto-carriers, at Thames Ditton, on January 6th, and I may say that when I arrived in the morning the finishing touches were being put to it. Taking it straight from the finishers' hands, I set out on my 200 miles journey to Hull. Now, although it rained nearly the whole of the way, my wife and I were able to keep clean, dry, and comfortable without the aid of waterproofs or any hideous disguise. We also had to traverse several yards of water near Peterborough owing to taking the wrong road in the town. The mudguarding is splendidly carried out, and it is surprising how clean the machine keeps. I also think it a splendid testimony to the care of the manufacturers that the machine did the whole journey without a single adjustment.

With best wishes for the prosperity of your interesting and useful journal, ROBERT AKESTER.

Freeing of Seized Pistons—Drastic Methods.

Sir,—The following may be of interest to your numerous readers. A motor cyclist in Ceylon, who has not been one for long, recently started on a twenty miles ride. After doing some two-thirds of it he noticed that the machine was beginning to run somewhat stiffly, and investigation showed that his supply of lubricating oil had become exhausted. As there was no chance of replenishing his supply, he decided to get as far as possible under power. When he was within a mile or two of Matara, his destination, the piston finally struck work, and he had to push in the remainder of the distance. It then only remained for him to free his piston.

Knowing that heat expands and cold contracts metal, he wired into Colombo (100 miles) for a cwt. of ice. This arrived the next day, but in the excitement of the moment the motor cyclist got a little mixed, and having carefully packed the outside of the cylinder with the ice, poured boiling water on the top of the piston *viâ* the compression tap. This not having the desired effect of freeing the piston, he had to devise a fresh method. Remembering having seen that a mixture of kerosene oil and baking powder had a rising effect he decided to apply this principle, and obtaining the necessary ingredients, poured them into a crank case through the drain tap, and anxiously waited for the piston to be forced up the cylinder. Strange to say, not even this drastic treatment caused the refractory piston to shift, and it became evident to the owner that something vigorous must be done. The piston could not be made to rise, but possibly it could be induced to descend. The question was, by what means.

After mature consideration, he procured a revolver, and, removing the compression tap, discharged six rounds of blank in rapid succession on to the top of the piston, which remained in exactly the same position. It now became evident that this was a particularly obstinate case, and he reluctantly had to admit defeat, and sent the machine into Colombo for further treatment. C 663.

Diyatalawa, Ceylon.

A Method of Truing Worn Pulleys.

Sir,—The troubles of belt owners have been aired with such unfailing regularity that we have decided to give our experience of similar troubles, the primary cause, and its obvious remedy. New machines leave the works equipped with correctly angled pulleys of, say, $\frac{5}{8}$in., $\frac{3}{8}$in., $\frac{7}{8}$in., and 1in. gap. The troubles for the first few thousand miles are practically nil, but once real trouble sets in the amateur condemns belts as unreliable, and sighs for the chain drive as the only solution of the difficulty. We look minutely into the matter and find that the belt rim is, practically speaking, still $\frac{7}{8}$in. in section and of correct angle, whereas the engine pulley is now $\frac{15}{16}$in. and of most distorted contour, often developing a distinct ridge. Slipping takes place, and the now gritty belt allows rapid wear to supervene by reason of its grinding action being as it were automatically exaggerated the longer it runs. A careful examination of the belt reveals (1) incorrect angle, and (2) shrinkage of $\frac{1}{16}$in. or more, due to the combined effect of stretch and wear. This gives us a $\frac{13}{16}$in. belt running in a distorted $\frac{15}{16}$in. pulley, a difference of $\frac{1}{8}$in. True, there is still a wedging action, due to the belt following its wear in the pulley, but a wedging drive is detrimental and results in proportionate absorption of power. Ninety per cent. seek to overcome the difficulty by either ordering a new belt or skimming the pulleys. The latter method is temporarily satisfactory, but results in a lowered gear, and in quite a short time the belt naturally finds the bottom of the pulley. A new belt of the original dimension ($\frac{7}{8}$in.), being of correct angle, is liable to slip in the untrue pulley, and truing the pulley as before stated is unreliable. Of course, a new pulley would speedily rectify matters, but if motorists would only have their pulleys skimmed up true and get a belt made $\frac{1}{16}$in. larger than the original they would be astonished at the result.

To restore distorted pulleys to their correct angle without expense or detaching proceed thus: Jack up cycle on stand and detach belt only while engine is hot. Get a friend to sit or lean on the saddle to keep machine rigid. Place a wood or other block and an old file (preferably flat) near at hand. Start up the engine by placing belt loosely over the pulley, drawing taut, and then smartly pulling the underside with the left hand, the right hand retaining the tension of the top portion. The engine having started up, place the block close up to the pulley, so that the top of the block is about level with pulley-shaft. Turn the file edgeways, using the cutting edge, and in five minutes both faces can be perfectly trued *in situ*. COMET CYCLE CO.

Engine Position.

Sir,—With regard to the article by "B.S." on the above subject in your issue of the 25th ult., I beg to point out that his remarks on distribution of weight are entirely wrong, and are not borne out by experience.

Equal distribution of weight does not minimise the tendency of a motor cycle to skid. In fact, the greater the load on the driving wheel, the less the liability to skid, and the consequent longer life of the back tyre.

That Scott machines hold up on grease is a fact, but it is not connected with the inclined engine, nor the forward position of same, but is due to the weight distribution, which in the first place is lower down than on a standard machine, and, secondly, the gear box, chain drive, petrol tank, magneto, etc., are all weighted on the back wheel, and consequently there is a greater proportion of weight on this wheel, giving the above result.

The machine I manufacture, which has been illustrated in your paper on a previous occasion, is a 2½ h.p. model, and the engine is carefully slung nearer the back wheel than the front, with the marked results of non-tendency to skid, and long life of the back tyre.

All the two-speed machines are much steadier in grease, owing simply to the greater weight on the driving wheel.

Another big factor in the behaviour of a machine is the rider. I have ridden behind Jack Marshall on a T.T. Triumph with plain round Dunlop tyres, through twenty miles of treacherous roads and many miles of tramlines, and his back wheel has not shown the slightest variation from its true track. REG. SAMSON.

Lubrication Systems.

Sir,—"Amateur" falls into a common error in assuming that there is any "oil drag" with inside flywheels. If an abnormal supply of oil is given to the engine, some little drag might take place, but this could not be sufficient to affect materially the power developed.

For instance, when a charge of oil is injected on the road most engines will accelerate; if oil drag of any magnitude occurred, one would naturally expect the engine momentarily to slow down. What actually happens is that the oil in the crank case is taken up by the flywheels at starting; as speed increases, this is scattered over the internal parts of the engine which, offering a large area, retain a considerable quantity of oil. At highest engine speeds the oil is broken up into minute particles and forms a miniature fog or "Scotch mist" inside the case. No further oil is taken up by the flywheels until a sufficient quantity has drained down the sides of the crank case to touch the flywheels again. A moment's thought will show that under normal conditions very little oil indeed will remain at the bottom of the case for the flywheels to run in.

We submit that the external flywheel engine for motor cycle purposes has greater disadvantages than the imaginary power loss caused by oil drag on the internal flywheel engine.

We are quite in agreement with "Amateur" on the other matters he mentions. Our experience is that large area plain bearings are now being demanded in preference to the existing types of single row non-adjustable ball bearings.

Generally speaking, we believe the buying public are now beginning to realise a fact that was proved years ago, viz., that this type of bearing is only suitable for light loads at high speeds. THE CONDOR MOTOR CO.

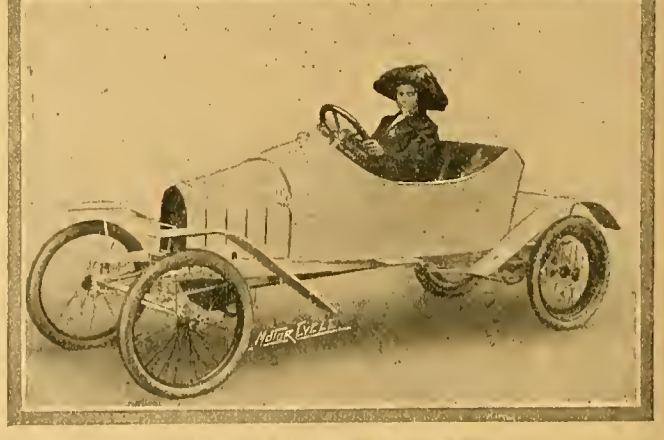
Sir,—Your correspondent, "Amateur," raises some interesting points on lubrication, etc. There is no doubt, as he says, that internal flywheels fling the oil away from the big end bearing, but not only this, if a sufficient level of oil were kept in the crank case for the big end to dip into, the flywheels would drench the cylinder with an excess of oil, and rapid carbonisation would result. It is a most difficult matter in a motor cycle engine to give both cylinder and bearings their required amount of oil; the quantity in the crank case (about one pumpful) sufficient for the cylinder is totally inadequate for the bearings. The direct system of lubricating the gudgeon pin and big end by an oil pipe to the cylinder wall seems a step in the right direction.

It is certain, in my opinion, that motor cycle engines will in future have to be either water-cooled or properly lubricated by a definite system, as on cars. The modern high compression single develops so much heat that its bearings simply cannot be expected to stand the strain.

I do not think there is much in what "Amateur" says about the friction of internal flywheels in the oil. Turning the engine round by hand is all very well, but what about two or three thousand r.p.m.? At running speeds the flywheels will not be ploughing their way through a sump of oil; they will be flinging it about. Not only this, but crank cases get hot enough to reduce the viscosity of even a heavy oil enormously.

One point on lubrication I have not seen mentioned is this. In modern side by side m.o.v. engines the valve pocket capacity is large, and consequently the piston has to come very high up in the cylinder in order to get a sufficiently high compression, and in my engine (1911 type) the piston pushes the oil over into the valve pocket and all over the valves, stems, and guides. A domed piston should be an improvement, as it would not need to come so high up in the cylinder. An oily valve was unknown on my previous machine (a.o.i.v.), as the piston did not come up level with the valve pocket.

I agree with "Amateur" *re* plain bearings. During seven years I have never yet had a ball bearing engine, and do not want one. It is interesting in this connection to note that one firm, Messrs. J. A. Prestwich and Co., fit and recommend plain bearings in their engines, using ball bearings in the racing engines. A friend of mine ordered plain bearings on a machine in which plain or ball bearings were fitted as desired, an extra charge being made for the latter. Unknown to him, the machine was delivered with ball bearings, and this was only discovered when, after nine hundred miles, there was considerable play in the mainshaft. The makers then fitted plain bearings free of charge!



S. H. CROW.

Delivery of New Machines.

Sir,—If my own experience may be taken as generally representing that of others there must be, I am sure, a large sum total of discontent among your readers. Shortly after the Olympia Show I placed an order with a prominent firm of manufacturers for a machine costing between £60 and £70, after being assured by their manager in London that delivery could be effected within a fortnight, or, at the very outside, three weeks. As a matter of fact, the machine is not delivered yet, and not only that, but all I can obtain in the way of information is an offhand suggestion that it "must" come to hand within a few days.

The firm has locked up something between £15 and £20 of my money, and I have up to the present nothing but empty promises to show for it. Those firms who are enterprising enough to be ready with their machines directly the year turns are the ones to support, and I consider it amounts to rank dishonesty to take a man's money and then keep shilly-shallying about for weeks and denying him any satisfaction in the matter of delivery.

It would, of course, be another thing altogether if from the very first one were told that delivery before February, for instance, were impossible, but to quote December definitely, knowing, as they must have done, that such a thing was impossible is, I think, to say the least of it, a contemptible and dishonest action. DISGUSTED.

A fair driver of a 1912 model L.M. quadcar.

Clean Counties.

Sir,—In your last issue you ask for information about a trap between Trumpington and Cambridge in 1911.

On Coronation Day, riding from London to Ely, I found a warning on the A.A. bulletin board about a trap on that stretch of road, but, personally, I passed through it at twenty-two miles an hour in safety.

K. T. GEMMELL.

Two-stroke Engines.

Sir,—Referring to the article on two-stroke engines in last week's issue, we would point out that, although we "do not claim any phenomenal speed" in our catalogue, this does not imply that our engines cannot be speeded up; 3,000 r.p.m. can be obtained without the slightest difficulty. As a matter of fact the machine that ran in the Gloucester Trial easily does forty miles per hour on a gear of 4¾ to 1 (*i.e.*, engine speed of 2,500 r.p.m.), and this speed was attained within the first two hours of the machine's life on the road.

We cannot altogether agree with the writer's remarks re the relative benefit of three and two port engines; practice shows the two port to be more efficient, and further there is considerably less liability of crank case firing—in fact, although we fit a relief valve to our crank case, we find it is rarely required, and then only in the case of extremely careless driving or using too weak a mixture. With a correctly designed engine back firing does not occur from any other cause.

Although we have made thousands of stationary engines, we have never yet resorted to gauzes which we notice seem to be essential in some three-port engines. We congratulate the writer on his very lucid article, but should like him to have some practical experience with our engines, and would also state that his drawing is not a correct illustration of our patent inlet valve. STUART TURNER, LTD.

[The sketch of the inlet valve referred to in the above letter was purely diagrammatic, and the valve was merely inserted to show its position.—ED.]

Multi-pole Sparking Plugs.

Sir,—Under the above heading, Mr. W. J. Lancaster writes that he has carried out some experiments in which he has used the Lodge double-pole sparking plugs in connection with the Bosch magneto, and states that up to date he has not had any trouble with the magneto. This, we quite think, is true, as he admits that in order to get easier starting he has had to reduce the gap between the two points inside the combustion chamber to a space so small that the points are almost touching. This in itself is an admission that the magneto is not capable of doing the work imposed upon it, otherwise it could fire two gaps of the normal opening as does the Bosch magneto, which is designed and manufactured for two-spark ignition, and which is capable of effecting such ignition without calling into use special types of plugs.

With these facts in view, where is the necessity to experiment with any other apparatus, when the Bosch Magneto Co. issue tested and guaranteed reliable articles for the purpose.

The letter written by Mr. W. J. Lancaster only emphasises what we have previously stated, and we further wish strongly to recommend owners of magnetos, whether Bosch or other makes, designed for single spark ignition not to impose upon them double the work, as by this means satisfactory results are not obtainable, although it may be possible slightly to improve upon the effect which is produced by single ignition; in any case, nobody can hope to produce the effect of the two-spark ignition.

THE BOSCH MAGNETO CO., LTD.
ARTHUR E. BENNETT, technical manager.

Sir,—With reference to the above, I first tried the Lodge plugs about two years ago, chiefly with a view to getting extra speed and power for that year's T.T. I used, at one period, as many as three plugs in one cylinder with a marked increase in power and apparently no detriment to the magneto, which was a Simms. I have never used these plugs with a Bosch magneto, but I have no doubt that the Bosch Company will admit that if a Simms magneto will stand three plugs in series, a Bosch should also be able to stand the strain.

With regard to ease of starting, I found that in my case (a 3½ h.p. Norton) it did not render starting any more difficult, being able to start my engine from cold with the three plugs in series with the first pull of the back wheel. I did not, however, use the plugs in the race, as I found the vibration at high speeds was too much for the construction of these plugs, but I have no doubt that they would give excellent results under ordinary touring conditions.

P. BREWSTER.

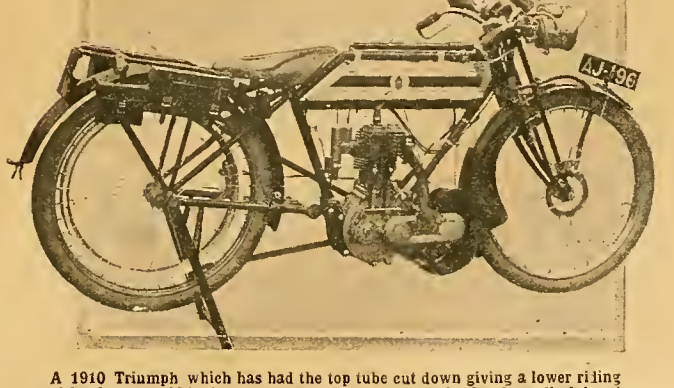
Sir,—In the issue of January 4th, a letter appeared asking both the Bosch Co. and ourselves to state whether the use of the Lodge double-pole plug does or does not have any ill effect on the magneto. We at once replied in the following issue, saying that we were anxious to prove clearly to readers of *The Motor Cycle* that the extra power obtained by the use of our double-pole plug was in no way secured at the expense of the magneto, and explaining that the best possible way we could convince them was for us to ask any users of both to be so good as to report their actual experiences.

In each of the three issues which have been published since January 11th, a letter has appeared on the subject, each from a different writer, all being users of both Lodge double-pole plugs and Bosch magnetos; and the report in every case has been exactly what we had anticipated, viz., that not the smallest difference is made to the magneto, while the power of the engine is considerably increased.

Not a single letter has appeared uttering a word to the contrary, so that we think this correspondence should finally settle the question and put an end to the quite unfounded suggestion that a double-pole plug might throw some detrimental strain on the magneto.

LODGE BROS. AND CO.

War Office Test at Brooklands.



Sir,—I notice in your report of the War Office test at Brooklands you state that the Zenith was the only machine which apparently satisfied the War Office officials.

I was rather surprised to read this, as according to the times in your report the Douglas was the only machine that complied with the War Office requirements which are as follow: Machines with about 500 c.c. 45 m.p.h. and machines with about 350 c.c. 40 m.p.h. W. W. DOUGLAS.

Sir,—Referring to your report of the War Office tests at Brooklands, I should like to point out that I was officially timed by a War Office official to accomplish the two laps in approximately 3m. 50s. per lap. Further, I did not run into the bank whilst ascending the test hill, but in attempting to turn round after having started up the engine.

It will be noticed that no machine accomplished a speed of 45 m.p.h. This was due partly to the low gears in use, but more particularly to the atmospheric conditions. It was foggy and intensely cold, and carburation was very much affected at high speed. HUGH GIBSON.

[We offer our apologies to Messrs. Douglas Bros. for the error. It is quite true that the War Office standard set for engines up to 350 c.c. was 40 m.p.h., which average the Douglas machine ridden by G. L. Fletcher handsomely exceeded. No times having been announced officially, it is impossible for us to confirm or deny Mr. Gibson's statement. His claimed speed is 42.5 m.p.h.—ED.]

A 1910 Triumph which has had the top tube cut down giving a lower riding position by about 2½ inches. Of course the tank capacity has been diminished as a result.

Silence.

Sir.—I notice a good deal of talk going on at present about noisy m cycles. About five years ago I made a silencer on the principle of cooling the hot gases. However, after it was used I found it was even better than I expected, for it not only cooled the gases, but it did away with practically all pressure in the silencer. The principle will be best understood from the accompanying

sketch. The length of the silencer is twice the length of the engine stroke, and the diameter is the same as that of the cylinder. One-eighth holes are bored in the air tubes, so that the total area of the combined holes equals twice the area of the exhaust pipe. Better results are obtained by only having $\frac{1}{16}$in. holes, but they are rather apt to choke up, which means taking the silencer adrift—a simple operation done by removing nuts A. After using this silencer for five months, the cylinder was removed to be scraped, but it was found there was practically no deposit to scrape, and the engine never overheated, even under most trying conditions. H. D. McRAE GALLANDAY.

The Evolution of Transmission.

Sir,—I was surprised to see published in your issue of February 1st a personal attack on my veracity and motives signed by initials. In common fairness, I must ask you to explain that my letter to *The Motor Cycle* was not published *in extenso*.

As regards the details which "F.R.H." states "it would be interesting to know," they are as follow :

1. The chain was a Hans Renold.
2. The car was a single-cylinder 9 h.p. Cadillac two-seater weighing 12½ cwts.
3. The stone was a finger-shaped flint about 1in. in diameter and 3in. long.
4. The differential fitted, as in all this pattern of central drive Cadillac, was on each side of the back sproeket wheel.

Your correspondent suspects that I have an axe to grind. This I freely admit, and, further, that I have been for over thirty years grinding at it. It is the progress of cheap, efficient, and safe road transit

Since my letter was published, I have received a number of queries from interested readers, several forwarded by the courtesy of your staff. If I have failed as yet to answer all these, perhaps the writers will forgive a busy country general medical practitioner, whose daily round is rarely less than thirty-five miles, and who is exceptionally busy at the present time. Indeed, during the last snow, on one day, when the whole district was covered some inches deep with a semi-solid freezing mixture, I rode twenty-eight miles on my little 2¾ h.p. pedal-less machine, fitted with a rubber belt (because I had not a leather one in my possession). Although, naturally, there was belt slip, still it was not so bad as to prevent my climbing the 1 in 8 hill out of my village.

I purpose taking no further part in this discussion at present, as I have given honest personal experiences, signed my full name, and defy anyone to prove interested motives. CHAS. S. PATTERSON, M.B., M.R.C.S.

The English-Dutch Trial.

Sir,—I should like to put forward a suggestion for selecting the English team of motor cyclists who are to take part in the trial with the Dutch team in August. Why not throw the selection of the team open to readers of *The Motor Cycle*? I consider a good idea would be to enclose a voting form in one week's issue of the paper, inviting readers to state, by placing a cross against the names, whom they consider worthy to uphold the reputation of the old country. It would undoubtedly create enthusiasm, and cause the trial to be followed more closely by the supporters of *The Motor Cycle*. W. COOPER

Sir,—A word about the choosing of competitors for the English-Dutch trial. I think it may be assumed that all the riders who have entered are reasonably skilled, and so the choice could safely and wisely be made from the point of view of machines, and not of riders

In each class the machines chosen should not be only not of the same make, but not even of the same type. For example, in the 500 c.c. class, if three machines are to be chosen, choose, say, a Triumph or some other standard 3½ h.p. of repute, a P. and M., and a Scott. These three machines represent three distinct types.

I think this method of choice would give a team which would be as fairly representative as possible of English machines of all types.

As in the choice of a rider for the popular 3½ h.p. class there would be many riders to choose from, if the choice was not obvious you could choose by their former successes in important trials. LODGE PALMER SCOTT.

Experiments with Hydrogen Peroxide.

Sir,—In answer to your correspondent "O 5298," I should like to say that the burner I used in all my experiments on hydrogen peroxide was one of Bray's fourteen litre cycle burners, which admits of air being injected into the flame after the gas has left the burner. The gas outlet in this type consists of two fine holes which are bored obliquely in the steatite top of the burner. I believe the "Roni" burner, which has a slit instead of a hole, allows a certain amount of air to mix with the gas before leaving the burner itself. Modern burners admit of a mixture of air and gas being used.

There is, of course, a definite proportion of air and gas which will give the highest illumination power with a given burner, and those which inject more or less air than is required to satisfy this ratio are not so efficient as those allowing the theoretical mixture to be used. A. RENFRED MYHILL.

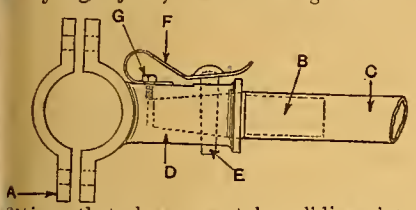
SUMMARY OF CORRESPONDENCE.

"A.K." writes in favour of rubber belts for transmission purposes, and instances a round top 1in. Dunlop belt which drove his 1909 twin Rex and sidecar a distance of 2,700 miles since last August and is now pulling well; the belt was shortened only three times in that distance.

J. Stanley White writes: Messrs. Parke Davis and Co. put up a solution of hydrogen peroxide which I find, from actual experiment, has remarkable keeping properties, and does not appear to lose its strength, even if the bottle should inadvertently remain uncorked. Its stable properties are stated to be due to small quantities of acetanilide, and the solution is as near as possible neutral.

Will "U 32" send his name and address to the Editor?

T. F. Lucas, who carried almost all before him at the Ceylon M.C.C. hill-climbs on his T.T. Triumph (see page 103, Jan. 20th).



AMONG THE ACCESSORIES.

Quickly Detachable Sidecar Fittings.

We illustrate herewith a detachable coupling for sidecars. The patentee is Mr. J. Wakeman, 32, Blenheim Road, Moseley, Birmingham, who writes as follows:

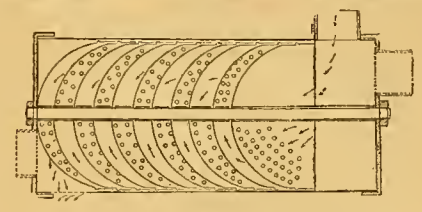
"I have a set attached to my Rudge motor cycle and sidecar and I find them quite satisfactory.

"The great point I claim is that the couplings being made with a taper socket and plug are very easily connected and disconnected, and also they make a perfectly rigid joint, much more rigid than a

fitting that has one tube sliding into another, and also it allows more latitude when a sidecar is being fitted, as the couplings centre themselves as long as the plugs just enter the sockets.

"The following short description will make the principle quite clear:

"The sketch shows the down tube bracket A, with plug B, which is brazed into sidecar tube C, fitting into socket D, and held in position by a taper pin E, which is prevented from shaking out by the spring F. To take adrift, all that is required to be done is to revolve the spring F, which is pivoted on screw G, to one side, and the taper pin E can be readily withdrawn, and the conplings then fall apart. The spring F is cupped where it makes contact with the pin E, therefore it cannot vibrate out of position."



The Cairns Device.

Messrs. J. Cairns and Company, Grimshaw Street Works, Preston, have introduced one of the most ingenious sidecar fittings we have yet seen. The accompanying illustration, figs. 1 to 4, shows the device clearly. The tube A, fig. 1, forms part of the sidecar frame, while the clip B is bolted on to the bicycle frame. The bolt C, fig. 2, is provided with two arms round which the first and second fingers are placed. When it is desired to detach the sidecar all that is necessary is to place the thumb on the bolt D, and lift the spring bolt with the first and second fingers. This allows the bolt to be withdrawn from the hole in the portion F, and to slide down the inclined plane. To place the sidecar in position it is only necessary to push the joint straight on to the portion F, when the bolt slides up the inclined plane and drops into the hole. It is then securely fastened, but to make it absolutely rigid and devoid of all shake, it is necessary to screw the bolt E up against the spring with the fingers.

Fig. 4 shows the saddle-pin bolt and the diagonal sidecar stay. It will be noticed that the saddle bolt G has an inclined plane on its slotted portion. This engages with the shoulder on the bolt H. Here, again, if pressure be exerted by pressing the bolt H against the inclined surface of G engagement will be made automatically, and, in the same manner, if the nut at the bottom of the bolt H be screwed up a perfectly secure joint is made. The joints appear to be well-made and are certainly most ingenious, being one of the quickest forms of detachment which has yet been brought to our notice.

A New Clair Silencer.

The accompanying drawing shows the latest pattern of Clair silencer, sold by Messrs. J. C. Lyell and Co., 113, Great Portland Street, W. It will be noticed that, while the outward form is neater than the old type, the original feature

of the Clair patent—the nest of cups—is retained. The new model, which will be ready for delivery in three or four weeks' time, will be made in different patterns, with the inlet in various positions, as shown by dotted lines in sketch, so as to suit different types of single and twin-cylinder engines. The new model is neat and strong, and, moreover, possesses the advantage of being easily adapted to various standard makes of motor cycles.

CAIRNS' QUICKLY DETACHABLE SIDECAR FITTINGS.

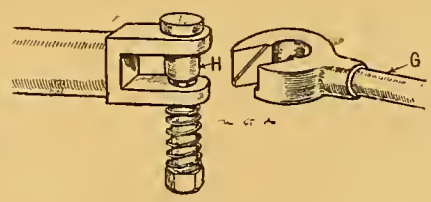

Fig. 4.

DECARBONISING MOTOR CYCLE CYLINDERS.

WE have already referred in these pages to the method employed by the Internal Combustion Engine Cleaning Co., Ltd., for removing carbon deposit from the cylinder of a petrol engine.

One day last week Mr. Sidney N. Fry, who is representing the firm in the Midlands, demonstrated to us the ease and speed with which a very dirty engine could be made absolutely clean without removing the cylinder. The apparatus employed consists of an oxygen tube and a flexible metallic connection from the oxygen tube to a short length of fine metal tubing which can be inserted through the valve cap and moved about all around the exhaust port and in the combustion space. The piston is, of course placed on the top of the stroke and both valves are closed.

Meeting of the Oxygen and Carbon.

The moment the oxygen begins to play on the surface of the carbon and a lighted taper is held inside the combustion head the meeting of the carbon and oxygen causes a roaring flame to issue through the orifice usually covered by the valve cap. Mr. Fry explained to us that the first flames were produced by the burning oil which had not quite carbonised on the piston head and cylinder. Soon the flames died down and incandescent particles of the carbon commenced to detach themselves, and were forced out by the rush of the combined flames of the burning oxygen and carbon. In a few moments both piston and cylinder were quite clean right down to the metal, and there being no longer any carbon remaining, the oxygen refused to ignite except when grease from the lighted taper was dropped on some portion of the hot valve port. One would be inclined to think that great heat applied in this way should have a detrimental effect on the exhaust valve and piston, but strangely enough the carbon deposit acts as an insulator for the metal until it is burned off, when there being no more carbon remaining the flames die out. Naturally the metal becomes fairly hot, but even immediately after the process is concluded it is possible to touch the metal with the bare hand.

Licensing Arrangements.

The process is known as "Cylclean," and the firm whose address is 3, London Wall, London, E.C., are licensing garages in each town of the United Kingdom, and providing them with the necessary outfit to enable them to undertake the cleansing of any sized cylinder.

TIME TO LIGHT LAMPS.

,,	14th	... ...	6.9 ,,

Leicester Motor Cycle Show.

The above show was opened yesterday (Wednesday), and will close next Saturday. It is being held in the Y.M.C.A. Hall, London Road.

The Rights of Motorists.

At its last meeting the Legal Committee of the R.A.C. considered a report of a case relating to damages sustained by motor cyclists on freshly-tarred roads, in which report some strong remarks were made on the rights of motorists by the County Court Judge before whom the case was heard. It has been resolved to draw the attention of the Lord Chancellor to the nature of these remarks.

Another A.C.C.F. Hill-climb.

The Auto Cycle Club of France has decided to run another hill-climb, on the 25th inst., on a hill called Montenglaust (Coulommiers), which is about thirty miles from Paris in an easterly direction. The hill is on an unused road, and has a gradient of 1 in 9. It is best reached from Dieppe or Boulogne by taking the direct route to Compiègne. The competitors will race over two kilometres, one kilometre of which will be the hill-climb. The event is open to motor bicycles, tricars, and voiturettes.

Class 1.—255 c.c.

Class 2.—300 c.c. for singles, 350 c.c. for twins.

Class 3.—500 c.c. for singles, 600 c.c. for twins.

Tricars.—750 c.c. for singles, 1,000 c.c. for twins.

Voiturettes.—Under 750 c.c. for singles, 1,000 c.c. for twins, and 1,250 c.c. for four cylinders.

Two Important Cases.

In the High Court of Justice recently (Jones and another v. Lees), Justices Hamilton and Banks held that if a horse escapes on to the highway owing to a defective hedge and collides with a cyclist, the owner of the horse is not liable in damages to the cyclist, for at common law the owner or occupier of land adjoining a highway has no duty to keep his "inoffensive" domestic animals, or animals not known to be dangerous, off the highway. This seems pretty definite, but should the owner of an animal know the animal to be dangerous the law would be different. Another case decided in the Court of Appeal was somewhat similar. In Ellis v. Banyard, Lord Justices Vaughan Williams, Buckley, and Kennedy, held that if cattle stray on to the highway owing to a gate being left open, there being no evidence of who left the gate open, the owner of the cattle, who was also the owner of the field and gate, cannot be mulcted in damages caused to a cyclist through collision with the cattle. (Reported in Law Notes of January, 1912.)

SPECIAL FEATURES.

A Week-end on a Sociable.
Definition of Quadcars and Runabouts.
Inter-club Trial in Surrey and Hants.

Entries for the T.T. Races.

The following provisional entries have been received for the T.T. Races, to be held in the Isle of Man, June 28th and July 1st: C. R. and H. A. Collier (Matchless), both events, and S. A. M. Witham (three Blumfield machines). The four following have entered, but have not stated the machines they intend to ride: J. Gibson, J. T. Bashall, Harry Bashall, and D. C. Bolton.

What Some People Want.

A letter in the current issue of *The Autocar* from Mr. H. F. T. Morgan, the maker of the Morgan runabout, explains why it is inadvisable to make a motor cycle type of runabout with too luxurious a body. He says: "A heavy body entails either too little speed or too large an engine. Some people when purchasing insist upon luxurious and heavy seating. Strange requirements are sometimes suggested. I have been asked to fit a Silent Knight engine to the Morgan runabout."

C. R. Collier Declines American Offer.

We understand that C. R. Collier has received a definite offer from America guaranteeing him £20 a week in addition to prize money if he would take his Matchless motor cycle to the States and try conclusions with de Rosier and others on some of the best racing tracks across the water. The dates mentioned in the offer are May and June, but as the dates of the Tourist Trophy Races have been fixed for June 28th and July 1st, Collier has refused the offer so that he may be able to race in the Isle of Man. Bravo Collier!

Members of the South Birmingham M.C.C. who, in spite of the temperature, turned out in large numbers last Saturday on the occasion of the opening run.

M.C.C. Continental Tour.

The committee have the intention of arranging a tour in France from about the 10th to 18th August, provided sufficient support be forthcoming. It is expected the total expenses will not exceed about £10 per head.

The Motor Cycle Manufacturers' Union.

Mr. H. G. Burford having resigned his position as general manager to Humber, Ltd., has also resigned the post of chairman of the committee of the Manufacturers' Union, and his resignation has been accepted. Who will be the new chairman?

Prizes in the Six Days.

The Auto Cycle Union has been pleased to accept our offer of two silver cups as *The Motor Cycle* special prizes in connection with this year's Six Days' Trials. One of these will be awarded for the best performance by an amateur, and the other for the best performance by a trade rider, the decision to rest as usual with the judges.

List of Records.

For convenience of reference and for hanging in the office, we have had a list of British motor cycle records mounted on cardboard. We have still a limited number left, and any reader desiring a copy has only to send the postage, twopence. Agents and depot managers should find the list particularly useful.

Exceptions prove the Rule.

"N.S.U." writes regarding motor taxation, and points out that although it is the law that the driver's licence must be taken out in the licencee's resident county, his case is an exception that proves the rule. Although living in one of the Welsh counties a licence to drive was issued to him by another Welsh county authority. It is the first time we have seen a driving licence issued by any county to a motorist not resident in that county.

Increasing the Engine Power.

Before a good attendance of the A.C.U., on Thursday evening last, Mr. W. G. McMinnies read a paper entitled "Speed and Power," illustrated with lantern slides. Some interesting devices for increasing engine power were shown, such as air scoops to force the charge to the engine, increasing the power by the use of the compression of the crank case to assist the petrol flow. Devices for increasing the freedom of the exhaust included a pipe by which the gases could be drained into the crank case. Another showed the engine modified so that, besides the ordinary exhaust valve, it had another overhead exhaust valve. In the case of cylinder ports at the end of the piston stroke it was pointed out that, provided the piston was of sufficient length to cover the port when at the top of the stroke, no noticeable leakage of oil occurred. Another device intended to assist in cooling the engine consisted, in principle, of utilising the crank case compression to force cool air on to the exhaust valve. After the paper there was an interesting discussion, in which, among others, Messrs. Brooker, Karslake, Rhys, Cooper, Bashall, and Oliver took part, and many pertinent questions were raised, to which the lecturer afterwards replied.

Police Traps.

The Metropolitan police are very active in the neighbourhood of Kingston. Traps are frequently worked between Putney and Kingston, notably from the horse trough to the farm house at the foot of the hill leading from the cemetery, from Beverley Brook onwards for one furlong, working at night, and at the top of Kingston Hill and on the hill itself.

Motor Cyclists go Skating.

The bright frosty weather last Saturday was bracing, and added proof to the utility of the motor cycle. London streets were thronged with motor cyclists with skates strapped to their luggage carriers, seeking the numerous sheets of water round the Metropolis where skating was in vogue. We had a most enjoyable spin down the Portsmouth Road, which was in fine condition, and at the Hut, Wisley, there was a huge gathering of motor cycles and cars. Hal Hill, F. Thomas (the rider of the famous G.O.K.), and the brothers Bashall were disporting themselves on the ice, and enjoying the bright sunshine. Our mount was a 1911 3½ h.p. clutch Triumph, kindly placed at our disposal by Messrs. Godfrey and Applebee. It pulled splendidly, but on the return journey we experienced much lamp trouble, owing to the water freezing in the generator.

The week-end saw several well-known members of the M.C.C. taking advantage of the recent few days' severe frost. They journeyed down from town by motor cycle to Ruislip Reservoir. There a splendid stretch of ice awaited them, and skating was in full swing. Amongst the number we noticed were Messrs. Southcombe May, B. Marians, W. Cooper, and E. B. Dickson.

Coventry and Warwickshire M.C. Eighth Annual Dinner.

The above club's eighth annual dinner, which was held at the Masonic Hall, Coventry, on Friday last, was a great success. About 120 members and friends assembled, and nearly £200 worth of prizes were distributed.

Sutton Coldfield A.C. Open Reliability Trial.

Fifty-seven entries have already been received for the above trial, which will take place on the 17th inst. Entries close on the 12th inst., and a list of these is published on page 152 of this week's issue. The regulations, route, and other particulars were given last week (see page 125). The start will be at 9.30 a.m. from the Gun Barrels Hotel, Bristol Road, Birmingham.

Motor Cycle Sledging.

On the snow bound roads south of London at the week-end we saw two motor cycles, one with a sidecar, each drawing a sledge. The drivers, Messrs. M. Campbell and D. Lavender, of the Wanderers M.C.C., had one or two spills which added to the fun. On the exposed parts of the road at Cudham the drifts were so heavy as to stop motor cycles, and even cars were brought to a standstill.

Misleading Advertisements.

The Cycle and Motor Cycle Manufacturers' and Traders' Union asks us to draw readers' attention to the letter which is published in the Correspondence columns in this issue regarding the insertion of misleading advertisements in the "Wants" column of the daily press. Agents and others interested are requested to inform the secretary, Mr. Alfred Bednell, Masonic Buildings, Coventry, of any misleading advertisements brought to their notice.

SKATERS AND THE MOTOR CYCLE.

Both motor cycles and push cycles were largely used for getting to the various skating centres last week. The picture is a scene on the side of the lake on Wimbledon Common, and shows two Chater-Lea sidecars whose owners are indulging in this popular form of sport.

Inclined Engines.

The writer of the interesting article on inclined engines ignores the rather common American practice of inclining a single-cylinder engine *backwards*. In warm weather the proximity of the standard vertical single-cylinder to one's legs is rather unpleasant, but the backward tilt must accentuate this, and in addition affects weight distribution to some extent. It would be interesting to hear American manufacturers expound the reasons which induced them to adopt this design. May I further wonder why a few makers who tilt their single-cylinder engines forward do not cast the radiating fins horizontally so as to lie parallel to the ground line? One would imagine that if the fins are kept at right angles to the axis of an inclined cylinder, one fin must screen another and reduce the cooling efficiency.

Are Cut-outs Desirable?

Personally I confine the use of a cut-out to two sets of conditions, viz., climbing steep hills and threading heavy traffic. Better design would obviate the usefulness of the cut-out in climbing exceptional hills, and from this standpoint legal repression of cut-outs is certainly to be welcomed; it will accelerate the production of better engines. As regards the other circumstances, I have always asserted that a silent motor bicycle is a most dangerous vehicle in traffic. The silent car is safeguarded first by its size, which ensures its catching the eye of a pedestrian, and also by the comfort and ease with which a car is slowed, stopped, and restarted, as contrasted with a motor bicycle. I confess that in busy cities I almost invariably drive on the open cut-out in day time; the restricted throttle opening prevents really excessive noise. If the law robs me of my cut-out, I shall be compelled to make excessive use of a penetrating hooter or exhaust whistle, which will be less convenient to myself and more irritating to the public whom I so lovingly protect. The whole trouble is due to the mannerless riders who love to crackle along under all circumstances and at all speeds with a well-tuned engine and open exhaust.

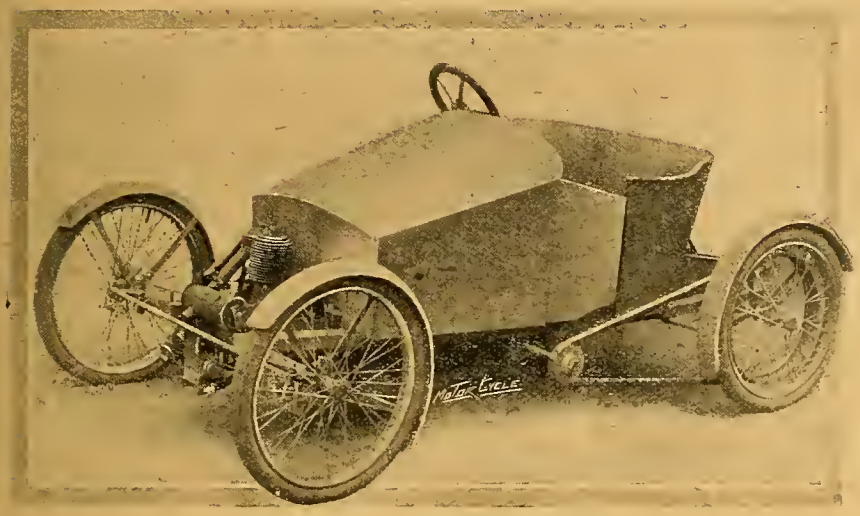
Silencers in the Big Trials.

The A.C.U. regulations on the subject of silence in important trials have always been a laughing stock. On some occasions the officials have professed to seal the cut-outs; under these circumstances some riders have drilled out the normal orifices to obtain as free and noisy an exhaust as if the cut-out were permanently open, while others have adroitly hoodwinked the gentlemen with the pliers and wire, and gone through the entire trial with their cut-outs free, using them at discretion. On other occasions a general threat of disqualification for excessive noise has been deemed sufficient, and the riders have pleased themselves on the cut-out question, many eminent riders only closing the shutter when they caught sight of one of the more virile officials. As a consequence there is a distinct impression abroad that the A.C.U. are not in earnest on the matter.

If the A.C.U. are in earnest they have two fairly simple alternatives. One is to appoint as "silence judge" in their next trial a courageous independent rider, devoid of commercial interests, who shall wander about the route at his own free will, not confining his presence to half a dozen hills, where a group of cars and red flags warn the more callous competitors to be on their guard, and to base a stern system of marking on his reports. The other is to enforce a standard silencer in each class outside barrel of a given length and diameter, inside barrel ditto, no cut-out, fixed number of outlet holes in each barrel, each hole to be of a given size, all silencers to be tested at the start and at the finish.

At present the silence regulations are regarded as a huge joke; but perhaps this is the intention of the A.C.U.? In the meantime we are threatened with repressive legislation, and in certain police areas this legislation will produce many annoyances.

Chrome Leather for Belts.

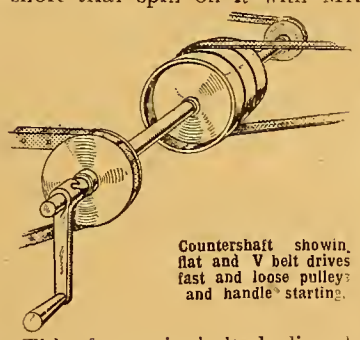


Until quite recently I had never tried a belt made of real chrome leather. A few months ago a chrome leather belt was put at my disposal. In form it was an ingenious evasion of several well-known patents, designed to give flexibility to a leather belt of large section.

If a length of the leather was left for forty-eight hours in water the substance seemed totally unaffected, and I put the belt into use with great expectations. So far as I was able to judge the belt was not subject either to glazing by grit or to slipping caused by wet; but it had two very fatal defects, in that it stretched very rapidly without any limit, and that it was brittle and kept snapping.

Now I hear of other similar belts in preparation for the market, and of one in particular which is stretched at each stage of manufacture. The hide is stretched upon purchase; when it is "raw-hide tanned," it is stretched again; again in the "chrome tanned" stage; again when cut into strips; and, finally, when it is built up into belts. This particular leather seems to defy ordinary stretching tests, when its preparation is finished, and it is not brittle, for if a strip be slit to within half an inch of its edge, it requires great force to tear the slip away.

I wonder whether a perfected chrome leather belt may solve the problem of winter transmission, so far as belt-driven machines are concerned. My experience should warn readers that some chrome belts are very, very bad if others are good. The promising belt to which I have alluded is not yet on the market, so it is useless for readers to write to me for further information.

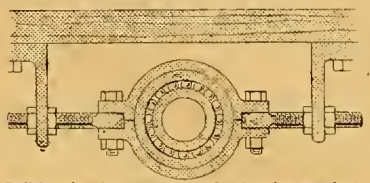


ANOTHER SPIDER QUAD.

Three-quarter view of the light quad described.

AT the present time there is being tested in the neighbourhood of Coventry a novel type of sociable quadcar, which is intended to be manufactured and sold at the price of an ordinary high grade motor cycle. Its chief features are absolute simplicity and light weight.

We have examined a rough experimental machine and have been for a short trial spin on it with Mr. Glover, the designer, and we may safely say that it seemed quite practicable, and has much promise.



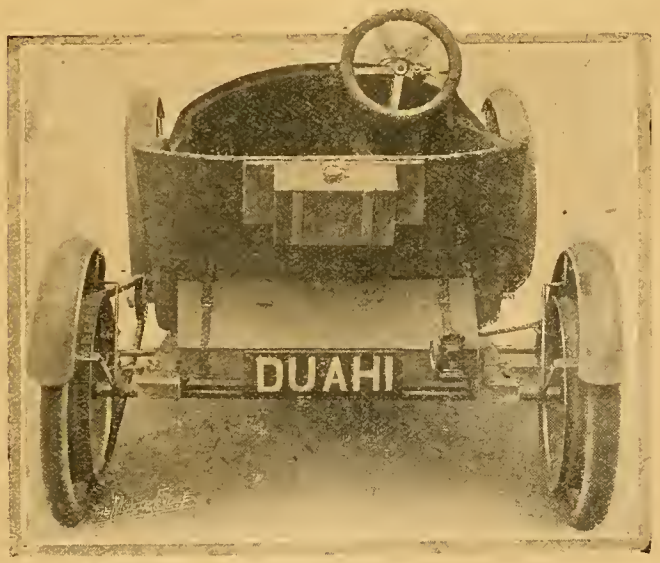
Countershaft showing flat and V belt drives fast and loose pulleys and handle starting.

The motor in use for test purposes is an ordinary 3½ h.p. air-cooled motor cycle engine, which is suspended on a short tubular frame. This frame is bolted directly to two ash boards which form the main frame, and lie with their breadth parallel to the ground.

A tubular axle is bolted rigidly to each end, and serves as a cross member. No springs are used, but the ash boards form a very fairly efficient "buck board" construction.

The Novel Transmission.

Transmission is by flat belt to a fast and loose pulley on the counter-shaft, thence by a V belt to one rear wheel. We understand that in future a two-speed on these lines will be used in conjunction with a V belt to the other rear wheel, giving a lower gear ratio. The counter-shaft is adjustable, so that the belt tension may be easily altered. A handle starter geared up to the counter-shaft by chain is employed. The



Ball bearing for counter-shaft, showing method of adjusting belt.

difficulty of fitting a body to this type of frame is overcome by slinging the body from the front and rear ends only, the rest lying well clear of the frame.

The steering is on the double reel and cotton system, the ends of the wires being sprung so as to absorb road shocks.

Although the machine we tried was only fitted with single gear and fixed point magneto, it had quite a fair turn of speed, and though we met with no severe hills, all those we tackled were surmounted with great ease. The springing is fair, and certainly more comfortable than a motor bicycle, though it must be confessed that pot-holes are at times noticeable. The makers are Messrs. Glover Bros., engineers, Spon Street, Coventry.

Rear view showing belt transmission and petrol tank at rear

One of the R.I.A.'s experts and an assistant travelled over a large number of roads in the Metropolitan area on three or four mornings last week to examine the surfaces and to ascertain the effect of frost on road dressings. As a result of these inspections, the association's expert has drawn up the following list of materials composing road surfaces arranged in order of non-slipperiness: First and best, asphalt and experimental roads deep treated with tar or bitumen; second, smooth tarred roads, *i.e.*, those that have been tarred on an existing smooth macadam surface; third, smooth untarred macadam roads; fourth, rougher and uneven untarred macadam roads; fifth, new and consequently smooth and even wood pavement: sixth and worst, old and uneven wood pavement.

THE TOURIST TROPHY RACE.

The Snaefell Course Sanctioned. Dates June 28th and July 1st. Ten Mornings' Practising.

LAST week the Highway Board of the House of Keys considered an application by the Auto Cycle Union to hold this year's Tourist Trophy Motor Cycle Races over the long course, including the ascent of Snaefell, and the application was acceded to. We mentioned in our last issue that the Tynwald Court had granted permission for the races to be held in the Isle of Man, but recommended the old short course, starting from St. John's and embracing Ballacraine, Kirk Michael, and Peel. It will be remembered that it was *The Motor Cycle* which urged the desirability of a change in the course in face of some opposition, and, further, commenced the campaign in favour of including the Snaefell Mountain climb on every circuit. How far that adopted recommendation went towards developing the ideal change-speed gear it would be impossible to over-estimate. The Auto Cycle Union officials, also realising the good brought about by the Snaefell course, wisely wired to the Isle of Man authorities last week asking if the mountain course could be used in preference to the St. John's course, and we are pleased to report that the House of Keys unanimously granted the necessary permission, and, further, arranged that the dates of the Junior and Senior T. T. Races should be fixed for June 28th and July 1st respectively.

Douglas People Delighted.

The start and finish will be at Woodlands, on the outskirts of Douglas, as before, and our Manx correspondent wires us to the effect that Douglas people are delighted with the decisions, as it will give a splendid start to the visiting season. It is regretted on the island that the Motor Cycle Manufacturers' Union should have gone so far as to interfere with the application for permission to hold the event, and the Manx people hope yet that the Manufacturers' Union may see the error of its ways and support the race.

Ten mornings' practising will be allowed, this year a time having been fixed, viz., 5 a.m. to 7.30 a.m. As heretofore, competitors may not use their machines during the daytime or on Sundays.

ENGLISH-DUTCH RELIABILITY TRIAL.

ON the 18th inst. the Dutch Motor Cycle Club will hold a council meeting to consider a suggestion that the number of the teams in this International contest be increased to nine aside. If sufficient Dutch entrants are forthcoming the club will agree to the increase in view of the popularity of the trial in this country.

Another matter is the question of charging a small entry fee for the amateur entrants. It is considered that a small fee will be a guarantee of good faith, and eliminate those who may send in their names without any actual intention of taking part in the contest when the time comes. A nominal entrance fee of five shillings is therefore under consideration.

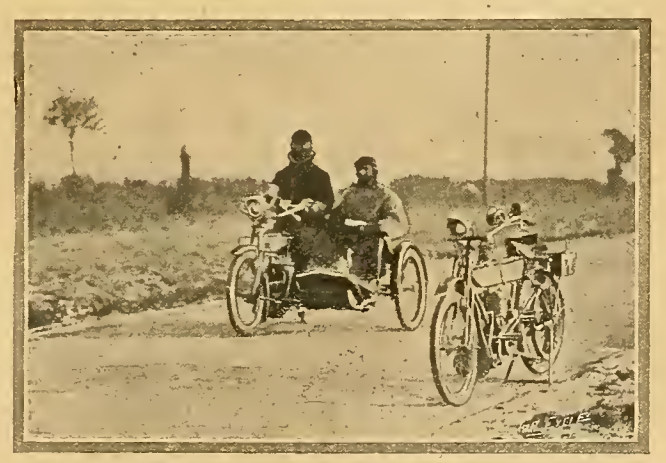
After these matters have been settled, the question of choosing the team to represent this country will be proceeded with. Sufficient entries have been received to render the selection of a representative team possible, but more nominations are required in the amateur lightweight class. First and second reserves must also be picked, so that there may be no possibility of the British team starting with depleted ranks in case of any mishap.

D. J. Danth (2½ h.p. Grandex-Precision) and A. F. de Waal (5 h.p. A.J.S. sidecar) have notified us of their intention to join the English party.

Streatham and District and Surrey M.C.C.'s Joint Winter Reliability Trial. Competitors coming up Coast Hill, Dorking.

Winter Reliability Trial and Inter-club Competition.

Streatham and District M.C.C. v. Surrey M.C.C.



Inter-team Trial between the Surrey and Streatham and District M.C.C.'s. The start at Leatherhead.

AT 8.30 a.m. last Saturday the first man in the above event was despatched from Leatherhead, the rest following in pairs at half-minute intervals. The route lay through Dorking, Guildford, Farnham, Hock, Basingstoke, Newbury, Andover, to Winchester. Soon after leaving Dorking, Coast Hill had to be ascended. Here we passed A. J. Clayton (3½ two-speed Humber and sc.) stopped half-way up. A. J. Luce (8 Zenith and sc.) failed on this hill owing to a slipping belt; however, after descending and fitting a new one he made an excellent ascent. R. G. Mundy (2½ three speed Singer) came up excellently on second speed. Just outside Guildford F. W. Barnes (8 Zenith and sc.) was troubled with a slipping belt; however, after descending and fitting a new reaching Farnham he was again delayed owing to a puncture. He rode the same machine that he used in the French hill-climb, the cylinder seals being still intact. Before reaching Basingstoke we passed A. T. Tamplin (3½ Rudge) in trouble by the roadside. W. H. Davey (3½ Bradbury and sc.) was another competitor who suffered with belt slip, and had to stop outside Newbury. After checking at the G.P.O. the competitors had to make a non-stop to Andover, where they again had to check. On this section Hurstbourne Hill had to be ascended. C. F. Malkin (T.T. Triumph) made a splendid ascent. W. H. Davey (3½ Bradbury and sc.) ran a few yards with a slipping belt. J. Sparks (four-cylinder F.N.) failed. Vernon Taylor (multi-speed Rudge) made an excellent ascent. A. J. Clayton (3½ Humber and sc.) failed. G. F. Hunter (3½ Zenith) came up well. This section, being a non-stop, was, according to regulations, to be observed; we, however, only noticed one observer, he being on the hill. After passing through Wherwell, we found Vernon Taylor stopped, and on enquiring what his trouble was, we found that his left overall had caught in the pulley and had been pulled clean off his leg, somewhat hurting his ankle. It was some time before it could be extricated from between the pulley flange and clutch housing. A few miles on we passed Frank Smith (5-6 Clyno and sc.) with Robertson Brown his passenger busily engaged oiling sidecar springs. The next check was held at the Royal Hotel, Winchester, where lunch was served. Before reaching here G. F. Hunter (3½ Zenith) had a puncture in his wheel. After a halt of one and a half hours the competitors were despatched on their homeward journey. The route now lay through Bramdean, Chawton, Alton, Farnham, Guildford and Dorking back to Leatherhead. After leaving Bramdean a sharp turn to the left had to be taken. Here some of the competitors went wrong. While in Farnham F. W. Barnes and J. S. Flood (8 Chater-Lea and sc.) came in thinking they were leading, but learnt that somehow they had been off the route.

We only noticed one arrow during the whole run, and considering that many by-roads had to be traversed the route should have been marked very much better. J. S. Flood, whose combination appears to have a fine turn of speed, was travelling well near Guildford, when his back tyre went down, and on investigating he found that an old patch had come adrift. W. H. Davey's Bradbury and sidecar appeared to be running well by the way it climbed the hill in Guildford High Street. He came up the whole way at under 10 m.p.h. with his engine turning over at a regular speed. Many of the competitors made good time to Burford Bridge, where they stopped and had tea, after which about one mile brought them back to the Swan Hotel at Leatherhead. To qualify for a silver medal a competitor had to cover the route at a maximum speed of twenty miles per hour and a minimum of fifteen miles per hour, and make a satisfactory performance in the observed non-stop section. A bronze medal is awarded to every competitor completing the course within the prescribed time, but whose performance in the observed section is below the required standard.

In addition to those competing in the team trial many others started, but several took the wrong route—these will, of course, be disqualified. The time cards and checkers' reports have to be examined, and the final results will be published in our next issue. Below is a list of starters:

J. T. Wood (G.W.K.), W. H. Davey (3½ Bradbury and sc., N.S.U. two-speed), Vernon Taylor (3½ Rudge multi-speed), Frank Smith (5-6 Clyno and sc.), *A. T. Tamplin (3½ Rudge), *F. L. Goodacre (twin Moto-Rêve), C. F. Malkin (T.T. Triumph), A. J. Clayton (3½ Humber and sc. two-speeds), *F. Messer (3½ Bradbury and empty sc.), W. O. Oldman

One of the competitors going well along the Hog's Back, near Guildford

Winter Reliability Trial and Inter-club Competition.—

Frank Smith (5-6 h.p. Clyno and sidecar) ascending Coast Hill in the inter-team trial.

(8 Bat and sc.), A. G. Daw (2¾ Doulgas, two-speeds), J. S. Flood (8 Chater-Lea and sc.), Rex G. Mundy (2½ Singer, three-speeds), J. C. Bateson (3½ L.A.C.-Jap), T. H. Kennington (2½ New Hudson, three-speeds). Those marked * did not finish.

STREATHAM TEAM.

H. Hunter (2¾ Humber), non-stop, silver medal.
F. W. Barnes (8 Zenith and sc.), wrong route, disqualified.
S. T. Tessier (6 Bat), non-stop, silver medal.
J. W. Ayers (2½ A.J.S.), non-stop, silver medal.
G. F. Hunter (3½ Zenith), non-stop, silver medal.
P. Weatherilt (3½ Zenith), wrong route, disqualified.
Four marks.

SURREY TEAM (started one man short).

C. Feeny (3½ Triumph), non-stop, silver medal.
E. Cox (3½ Zenith), non-stop, silver medal.
A. J. Luce (8 Zenith and sc.), non-stop, silver medal.
J. Manuer Smith (3½ Triumph), non-stop, silver medal.
J. Sparks (four-cylinder F.N.), failed on Hurstbourne hill in non-stop section, bronze medal.
Four and a half marks.

Although the Surrey team started with one man short they hold the Marians cup for this year. Only five motor cyclists of the Surrey M.C.C. turned out, the Streatham and District members forming the rest of the competitors. J. T. Wood (G.W.K.) was a Surrey M.C.C. man, but could not form one of the team, as his runabout has four wheels.

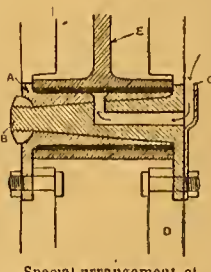
While going down to Leatherhead on Friday night, we found J. S. Flood in a garage in Epsom at about 12.45 a.m. It appears that his forks broke earlier in the evening owing to a flaw in the material near the spindle. He, however, stopped and found that his front tyre was rubbing against the fork. He had fitted a pair of Chater forks from J. C. Bateson's machine. Ringing up on the 'phone, he asked Mr. E. E. Lacey, of Peckham, to bring down a pair of Druids for his friend's machine. They eventually arrived, and luckily fitted the Chater-Lea head. When this had been done we all proceeded to Leatherhead, arriving there about 2.15 a.m.

J. H. Jeffery, the energetic secretary of the Streatham and District M.C.C., went through the trial in W. H. Davey's sidecar. He had hoped to have his new 8 h.p. Morgan in time, but it was delayed on the rail. The club members are very interested to see how this machine behaves.

Many of the competitors had forgotten to take their goggles, and consequently suffered severely for their forgetfulness. There was a great deal of dust about, and this, added to the cold wind, made things very unpleasant.

The roads around Basingstoke were in a terrible condition, stones being left unrolled all over the road. Only a foot or less was left on either side, which made it very bad for the sidecarists.

Lamp generators gave a great deal of trouble through freezing up, salt and whiskey being in great demand.



SUTTON COLDFIELD A.C. OPEN RELIABILITY TRIAL.

THE following entries were received for the above trial, which will be held on the 17th inst. The regulations were published in our last issue, and entries close on the 12th inst.

W. F. Newsome (3½ Triumph)
E. W. Cheshire (3½ Triumph)
J. Woodhouse (3½ Regal-Precision variable)
W. H. Sheldon (3½ Regal-Precision)
P. Moss (3½ Premier)
H. Brentsworth (3½ Premier)
S. H. Walden (3½ Premier)
A. A. Tye (3½ Premier)
R. Holloway (3½ Premier)
W. J. Spittle (3½ Premier)
W. D. South (3½ Rudge, variable)
S. A. Rowlandson (3½ Rudge)
T. Peck (3½ Rudge)
H. G. Church (3½ Rudge)
Vernon Taylor (3½ Rudge)
T. Silver (3½ Quadrant, three speeds and sc.)
S. Fontaine (3½ Quadrant)
N. Glassey (3½ Quadrant, three speeds and sc.)
J. St. John (3½ Quadrant, 3 s.)
M. Lake (3½ T.T. Quadrant)
Humber, Ltd. (3½ Humber)
Humber, Ltd. (2¾ Humber)
Humber, Ltd. (2¾ Humber)
V. Bushy (2¾ Humber)
P. J. Evans (3½ Humber)
A. L. Spiers (3½ Macbeth 3-sp.)
H. Jones (3½ Macbeth-Precision)
R. H. Viggers (3½ Macbeth 3-s.)
A. Winchcombe (3½ Matchless)
T. Hutton (8 Matchless, sc.)
Miss N. Hough (2¾ Douglas)
P. Phillips (2¾ Douglas)
W. W. Douglas (2¾ Douglas)
F. H. Stevenson (8 Morgan)
H. C. Pickering (2½ A.J.S.)
F. C. North (3½ Ariel, 3-sp.)
S. C. Perryman (3½ Ariel)
G. Newey (3½ Ariel)
H. G. Dixon (3½ New Hudson, three speeds)
H. Berwick (3½ New Hudson, three speeds)
Seymour Smith (3½ Norton)
P. Brewster (4½ Norton, sc.)
A. B. Wade (6 Zenith, sc.)
R. W. Duke (3½ Zenith)
H. Greaves (2¾ Enfield)
H. V. Colver (Enfield)
Harry Reed (8 Dot and sc.)
W. B. Gibb (2¾ Douglas)
L. Court (4¼ Ixion-Precision sc.)
W. R. Jones (3½ Ixion-Precision two speeds)
H. E. Perry (3½ Ixion-Jap)
H. Clark (3½ T.T. Corah)
Frank Smith (5-6 Clyno sc.)
W. H. Mahler (2½ Levis)
R. Newey (2½ Levis)
H. Goldman (3½ New Hudson)
F. A. McNab (2½ Levis)
H. Beal (3 N.S.U. 2 speeds)
H. Newman (3½ Ivy-Precision)
E. Smith (3½ Regal-Precision)
A. D. Arter (3½ James, 2-sp.)
T. Pollock (3½ James, 2-sp.)
W. H. Egginton (3½ New Hudson)
F. W. Finnemore (2¼ Veloce)
F. G. Brock (3½ Bradbury)
J. Blakeway (3¼ Precision)
H. Heaven, C. Williams, and T. Underhill.

CRANK PIN BEARING DESIGN.

The accompanying illustration shows the latest form of crank pin employed by the N.S.U. Co. It is practically self-explanatory, showing as it does that the crank pin is formed of two portions—the hollow portion A, which forms the journal of the big end bearing, and an inner portion B forming the crank pin itself. The advantages of a bearing of this type are that the bearing surface is increased without widening the overall width of the crank case, assembling is slightly facilitated, and there is not the usual likelihood of getting the flywheels out of line or twisted in making up. It will be noticed that there is an oil cup C at the side of the bearing, shown in section in the illustration, which collects the oil and conveys it direct to the bush and journal. The whole idea has been well thought out, and shows the care employed in the construction of these machines

Special arrangement of N.S.U. crank pin bearing.

Coventry and Warwickshire M.C. Annual Dinner.

A RECORD gathering of members and friends of the above club was held at the Masonic Hall, Coventry, on Friday last, the occasion being the eighth annual dinner. The diners sat at separate tables in parties of eight and upwards. At each table sat a member of the committee, the tables being named after well-known test hills, such as Barbrook Mill, Porlock, Willersey, Newnham, Mont Ventoux, Birdlip, Saintbury, Sunrising, and Edge hills. In the centre of each table stood a model triangular danger sign with the name of the hill painted on the triangle. The menu card took the form of a chart showing the enthusiasm in degrees which was expected to be reached at various points of the function. Mr. John V. Pugh presided, and among those present were the Mayor of Coventry (Colonel Wyley, V.D.), Messrs. Julian W Orde (Secretary R.A.C.), Stenson Cooke (Secretary A.A. and M.C.), F. Straight (Secretary A.C.U.). C. C. Charsley (Chief Constable), G. Sutton (Town Clerk) J E. Swindlehurst (City Engineer), H. W. Staner (*The Autocar*), Alfred Bednell (Secretary Manufacturers' Union), etc., etc.

The President, in proposing the loyal toasts, referred to his Majesty King George and the Prince of Wales as prominent motorists, and mentioned that the Prince of Wales had recently been taught to drive a motor.

"The Club," proposed by Mr. Orde, was, of course, the toast of the evening Mr. Orde referred to the various Coventry Club events which had been held during the past few years, and congratulated the club on its extraordinary prosperity during 1911. He said, in reviewing the provisional programme for 1912, that he noticed it promised to be a still more ambitious one than any previous year, nineteen events being outlined to take place during the season. He was pleased to see that no dates were definitely fixed for July, and announced that it was decided to hold the R.A.C. and A.C.U. inter-club meeting of associated bodies at Brooklands on July 27th. With the toast he coupled the names of the Mayor, Colonel Wyley, the chairman of the club, Mr. V. A. Holroyd, and the hon. secretary, Mr. Geoffrey Smith. He reminded the company of Colonel Wyley's hospitality, which he extended to the R.A.C. visitors to Coventry and Leamington in 1909, and in congratulating the club on their work, mentioned how much they were indebted to their chairman and hon. secretary.

Five Years President.

Colonel Wyley, in his reply, referred to the great interest he took in the club, of which he had been president five consecutive years. He felt sure that they had an excellent president in Mr. Pugh. Coventry had made motoring. As a representative of law and order he impressed on all motorists the importance of obeying the law, and said he thought that the best relations existed between Coventry motorists and the authorities, who were not hard on them provided they studied the convenience of other users of the road. He did not think there was anything pleasanter than being on the road, whether it was on a motor car or a motor cycle, and instanced the great amount of benefit and convenience he had derived from his membership of the Coventry Club and its association with the R.A.C. and A.C.U. At the conclusion of his speech he announced that Mr. M. J. Schulte had consented to accept the post of president for the ensuing year.

Prize Distribution.

Prizes valued at nearly £200 were then presented, which is a record for a provincial club. They have all been previously mentioned in these pages in our descriptions of the open and closed events in which the members have competed.

The Chairman also presented the R.A.C. medal to Mr. W. Grew in recognition of the signal service he had rendered to motoring and the Coventry club in particular. Mr. Grew was a founder member and the first secretary. On being called upon for a speech, the recipient acknowledged the presentation in a few words.

A Galaxy of Stars.

Mr. H. W. Staner proposing "The Visitors and Prize Donors," referred to the visitors as a "galaxy of stars." He was particularly fortunate, he said, in being allowed to propose the toast of the prize donors. His reference to the secretaries of the R.A.C. and A.A. and M.U. caused considerable amusement. He likened them to two suns revolving in not dissimilar orbits, and referred to the awful consequences of a collision between two suns, as the impact would be so great that the two masses would be resolved into incandescent gas. He coupled with the toast the name of Mr. Stenson Cooke, the secretary of the A.A. and M.U., which body he said had done a great deal to help forward the finest pastime in the world.

Mr. Stenson Cooke, in an extremely clever speech, said that he had been referred to as a "star." He believed the speaker really referred to the music halls rather than the astral bodies. He noticed that "stars" usually came on at places of amusement about 10.15 p.m., and as it was now 10.20 he thought the previous speaker's reference to him as one of the visitors was a very appropriate one. He then referred to Colonel Wyley as a "gallant soldier," and paid a tribute to the organising ability of Mr. Geoffrey Smith, the honorary secretary. A good many people, he said, thought motor clubs would come to an end when competitions ceased, but he did not agree. As long as there were dinners and visitors, in his opinion there would always be motor clubs. His reference to motor cycling as the most sporting side of motoring was received with applause. In conclusion, he said that some day he hoped to see the leading lady in Coventry's historical celebration riding a motor bicycle instead of a horse, and suggested as an appropriate costume goggles and a blush.

Mr. M J. Schulte the 1912 President.

"The Chairman" was proposed by Mr. E. Manville, who announced that the Daimler Co. would present the club with a prize for one of this year's competitions. Referring to the president's qualifications, he pointed out that there were two necessary qualifications for the post of president of a motor club—one was attention to the club's doings, and the other good sportsmanship. Mr. John V. Pugh was always to the fore in anything connected with club doings, and his sportsmanship was well-known, as he always turned up at club competitions on a motor cycle in preference to cars which he possessed. Mr. Pugh suitably replied, and referring to the coming president, Mr. M. J. Schulte, said that they could not have a better sporting president. He was not only the rider of a motor bicycle, like himself, but a driver of cars. Referring to the city authorities who were present, he said he thought there was no city in the kingdom in which the police were more tolerant to motorists provided they kept within the bounds of the law.

Mr. H. W. Staner then proposed the health of the "Town Clerk, the City Engineer, and the Chief Constable," who all replied. Mr. Charsley said that he was personally strongly opposed to police traps—a statement which was received with applause.

The toast list was interspersed with a musical programme, and the club anthem, sung by all members standing, was repeated at intervals. The singing of Auld Lang Syne wound up a most enjoyable evening, everyone voting that it was quite the most successful function the club had ever held.

Prizes value nearly £200 presented at the eighth annual dinner of the Coventry and Warwickshire Motor Club.

Club News

Newport (Mon.) and District M.C.C.

The annual general meeting will take place on the 10th inst., followed by a smoking concert. All local motorists are invited.

Middlesbrough and District M.C.C.

Fifty-five members and friends attended the annual supper and prize distribution at the Corporation Hotel on the 19th ult. Councillor A. E. Forbes occupied the chair and gave away the prizes. Then followed some speeches and a musical programme concluded the evening.

Furness M.C.C.

The annual meeting was held on the 1st inst. at headquarters (the Duke of Edinburgh Hotel). Dr. F. E. Daniel presided. Dr. E. W. Reed was re-elected president, with Dr. Daniel and Mr. S. E. Major as vice-presidents, Mr. E. E. Clow, 57, Storey Square, secretary, and Mr. P. L. Briant treasurer. The membership now numbers forty.

Ipswich and District M.C.C.

A highly interesting lecture on "Carburation" was given to the members of the above club by Mr. W. Low on January 20th at headquarters. Many thanks are due to the manufacturers of the Binks, Stewart Precision, Lukin, Cap, Senspray, B. and B., and Amac carburetters, who either sent specimens or drawings of their carburetters for inspection. The next item on the programme is a lecture entitled "Gearing and Motor Cycles," to be given by Mr. A. E. Newby on the 17th inst. at headquarters.

Purley and District M.C.C.

At the annual general meeting, held at the Greyhound, Croydon, on the 31st ult., Mr. S. F. Edge was unanimously re-elected president, and the following officers were elected: Captain, Mr. W. C. Fowler; vice-captain, Mr. H. S. Brett; treasurer, Mr. A. C. Huskinson; secretary, Mr. S. J. Tayler; competitions secretary, Mr. L. F. Ebbutt. The address of the new secretary is 19, Clifton Road, Wallington.

A slight alteration was made in the dates of the club's financial year, which will in future commence in January instead of March.

Blackpool and Fylde M.C.C.

The members' reliability trial took place on the 27th ult., the route being *viâ* Poulton, Garstang, Lancaster (check), Ingleton, Austwick (check), Settle, Clitheroe, Whalley, Preston (check), Broughton, St. Michaels. The following lost no marks, the order being arrived at by timing to seconds on the last stage: 1, T. Ball (8 Matchless sidecar); 2, R. G. Parker (2¾ Douglas); 3, C. Humber (2¾ Douglas); 4, G. F. White (3½ Bradbury); 5, T. M. Jones (5 Indian); 6, T. Wildman (2¾ Enfield). Several others lost marks on time only. There were eighteen starters. The trial was most successful, except for an unfortunate accident to Mrs. Sharples, whose sidecar collided with a lamp-post. Although badly knocked about, the lady is progressing favourably.

The British Motor Cycle Racing Club.

The annual general meeting of the B.M.C.R.C. took place at Carlton House, Regent Street, on Wednesday, 31st ult., at 7 p.m. Col. H. C. L. Holden, F.R.S., C.B., R.A., was in the chair. The proceedings were quickly carried through under the able chairmanship of Col. Holden. After the adoption of the report and balance-sheet, the following officers were re-elected: Mr. T. W. Loughborough hon secretary, Mr. A. G. Reynolds hon treasurer, and Mr. Alec Ross hon. auditor. A vote of thanks to Mr. T. W. Loughborough for his services during the past year was carried unanimously. The 1912 committee consists of the following members: Messrs. A. V. Ebblewhite, H. H. Collier, A. G. Forster, F. A. Hardy, F. A. McNab, W. Pratt, W. H. Wells, and Major F. Lindsay Lloyd, R.E.

Wimbledon M.C.C.

A run will be held from Wimbledon to Henley-on-Thames on the 11th inst. The start will take place at 10 a.m. from Wimbledon Town Hall.

Cardiff M.C.

A motor cycle section has been formed in connection with this club. Intending members should apply to Mr. T. Parry, 24, Boverton Street, Cardiff, before the 12th inst. for election at the next meeting on the 13th.

Club for North Wales.

It is desired to form a motor cycle club for riders living in Dolgelly and the surrounding districts. Those interested should apply to Mr. B. Edwards, Talrafon, Dolgelly, North Wales.

Wolverhampton M.C.C.

The annual general meeting was held on the 20th ult. Mr. W. Travers was re-elected chairman, and Mr. J. T. Ireland vice-chairman. The hon. secretary and treasurer, Mr. George Hill, was also re-elected. The hon. secretary reported during the evening that the first prize for the reliability trial to Colwyn Bay and back would be a week's stay free at Colwyn Bay any time during the season to suit the winner. The committee are anxious to make the club room at headquarters as attractive as possible, and they would be glad to receive pictures or postcards from the trade of motor cycle subjects, either sport or pastime, suitable for framing. Motor cycle catalogues and other interesting literature will be useful and acceptable.

Harrogate and District M.C.C.

On Thursday last, Mr. H. W. Fortune delivered a very interesting lecture, entitled "Incidents by the Way," to an excellent muster of members. The lecture was illustrated by over one hundred lantern slides, many of which had been lent by *The Motor Cycle*. The following gives a good idea of what pictures, etc., were shown: 1909-10-11 T.T. Races, 1911 Scottish Trials, 1910-11 A.C.U. 1,000 miles Trials, various local club events, A.C.U. Quarterly Trials, and a number of ancient motor vehicles. The technical part of the lecture related to working parts of an engine and how to keep the carburetter in good tune, also general hints on the management of the machine.

The Surrey M.C.C. has formed a section to study and develop military despatch riding and scouting. Our photograph shows the first class being held at the headquarters, Guildford. The chairman, Mr. Edward Cox, is in the centre, and the Hon. Sec. is standing next on the left.

Club News.—

Wolverhampton M.C.C.

It has been decided to hold a two-day reliability trial on March 16th and 17th to Colwyn Bay and back.

Oldham and District M.C.C.

The annual dinner took place at the Café Monico on the 23rd ult., followed by a smoking concert.

South Birmingham M.C.C.

Runs will take place on the 11th and 17th inst. from headquarters. On the 25th there will be a novices' reliability trial.

Purley and District M.C.C.

Mr. W. Pratt, the well-known exponent of the P. and M. machine, recounted some of his experiences in reliability trials on the 22nd ult. The lecture, illustrated by lantern slides supplied by *The Motor Cycle*, was most interesting and enthusiastically applauded.

Yeovil and District M.C.C.

The first annual dinner was held at the Half Moon Hotel. The chair was taken by the president (Dr. R. Hensleigh Walter). After dinner the prizes won during the past year were presented, and a very successful evening was concluded by a splendid musical programme.

Sussex M.C.C.

At a meeting held on the 25th ult. at the Fountain Hotel, Worthing, it was unanimously decided to form a club with the above title. It is proposed to form sections at different centres, also to become affiliated to the A.A. and M.U. or to the R.A.C. and A.C.U. Mr. Howard Winton, London House, Lancing, is hon. secretary *pro tem.*

Western District M.C. (London).

The annual meeting was held on the 22nd ult. Mr. E. Cubitt Sayers, J.P., was re-elected president and Mr. Ivor G. Babbage becomes treasurer. The new secretary is Mr. Maurice J. Tweedie, A.M.I.E.E., 1, Baldwyn Gardens, Acton, W., who will be very glad to hear from motorists living in Acton and Ealing and neighbourhood.

Cornwall M.C.C.

The annual dinner of above club will be held at headquarters, Red Lion Hotel, Truro, on Friday, February 9th. All motor cyclists in Cornwall are heartily invited to attend. After the dinner is over the annual general meeting will take place. Business: Presentation of prizes and certificates won during the past year, election of officers for the ensuing year, the fixing up of social runs, reliability trials and hill-climbing contests; also the deciding as to the date of the Penzance to Exeter and back run for the Raine Cup.

Derby and District M.C.C.

The annual general meeting was held at headquarters on the 24th ult. List of officers elected for 1912. Chairman, Mr. E. Clarke; captain, Mr. A. Ainsworth; vice-captains, Messrs. R. W. Spriggs and H. Baker; secretary, Mr. A. B. Bennett.

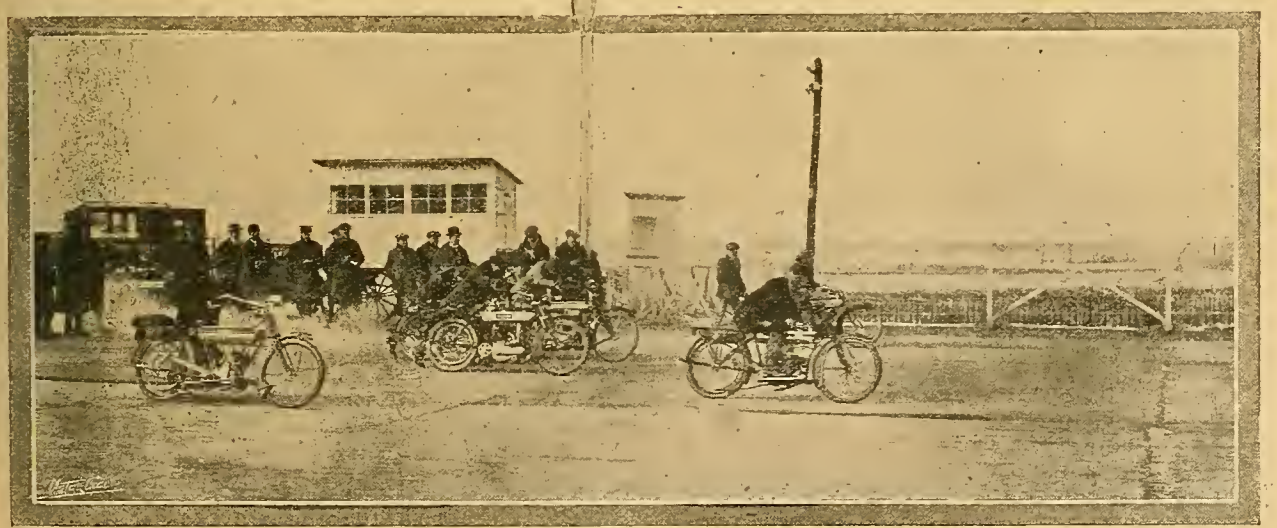
Manchester M.C.

The annual general meeting took place on the 23rd ult., when the following officers were elected: Captain of motor cycle section, Mr. J. E. Tytler; hon. treasurer, Mr. F. C. Hunt; hon. sec., Mr. G. Walker. It was decided to sever connection with the A.C.U. and R.A.C. The season's programme consists of the usual features. Nearly £60 has been promised to the prize fund.

Leicester and District M.C.C.

The annual general meeting was held at headquarters on the 26th ult., Mr. J. G. Graham occupying the chair. The report and balance sheet were duly passed and adopted. The membership now numbers eighty-three, an increase of forty over last year. Mr. G. W. Hillyard was re-elected president and Dr. C. B. Moss-Blundell vice-president. The following officers were elected for 1912: Chairman, Mr. E. G. B. Fowler; captain, Mr. J. Finlay; vice-captain, Mrs. Simpson; hon. treasurer, Mr. J. G. Graham; hon. sec., Mr. S. F. Fisher. A proposition "that no trade members serve on the committee" was rejected after much discussion; the trade members, however, in the meantime decided not to offer themselves for election.

North Middlesex M.C.C.



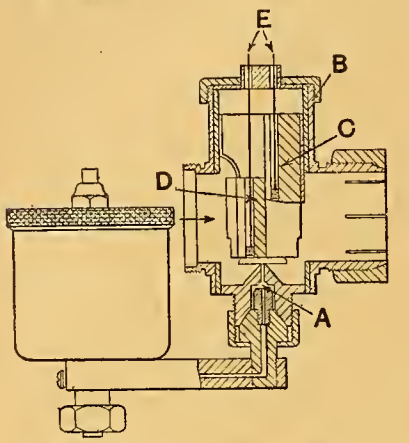
The first annual general meeting was held at headquarters Ye Olde Gatehouse, Highgate, on Friday, the 26th January. It was decided to request the Earl of Ronaldshay, M.P., to continue as president.

In accordance with the rules the following officers resigned but were all re-elected: Mr. W. H. Browne, chairman; Mr. D. Grey Blakey, "Headfield." Great North Road, Highgate, N., hon. sec.; Mr. H. C. Mills, captain.

Mr. J. A. Hilger was elected trials hon. secretary in place of Mr. A. V. Deacock (resigned), and Mr. P. Dangerfield consented to act as deputy captain in place of Mr. W. S. Bennett (resigned through illness).

The plans for the coming season were discussed, numerous competitions and social runs being arranged. The opening run is fixed for March 16th, and the first competition for members will be a 100 miles non-stop trial on March 30th. It has also been arranged to take part in the inter-team competition at Easter with the Herts. County and N.W. London Clubs.

The membership of the club now stands at ninety-five, including eight ladies.

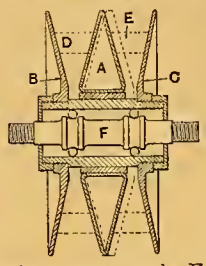


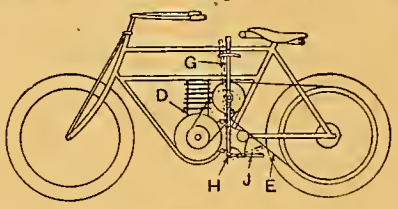
THE WAR OFFICE TEST AT BROOKLANDS, DESCRIBED IN OUR LAST ISSUE.

The above picture of the start for the speed test is an object lesson in itself, as showing the advantage a variably geared machine has in starting on the low gear. It will be seen that in the first dozen yards, G. L. Fletcher (Douglas), with P. Shaw (P. and M.) but half a wheel behind, has gained quite an appreciable lead.

[Carburetter Throttle Mechanism.

Above the jet A is a tubular chamber B in which is contained the cylindrical throttle sleeve C. This sleeve is cut



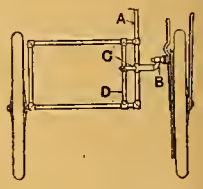


away at the points desired, and has arranged to slide within it the extra air plug D. The sleeve C and the plug D are operated by wires E, being normally moved downwards by springs which are omitted from the drawing for the sake of clearness.—F. H. de Veulle, No. 6348, 1911.

PATENTS.

A Variable Gear.

In this gear there is employed a double V pulley, the intermediate member A of which is free to slide and rotate on the sleeve to which the outer flanges B and C are attached. With this pulley are employed two belts D and E, the former driving from the engine and the latter transmitting the motion to the rear wheel. The pulley is carried on ball bearings on an axle F mounted on a lever G pivoted at H to a



link J. As the lever G is oscillated about its pivot the belts D and E alter their positions in the grooves, affording a variation of gear. The bearings on the axle F permit movement of the pulley laterally to compensate for variation of the belt lines. A free engine is obtained by means of the link J to which the lever G is pivoted. When the link J is moved into the position shown in dotted lines one of the belts is slacked off to an extent permitting of the engine running without any motion being transmitted.—J. A. Prestwich, No. 30,168, 1910.

A Sidecar Improvement.

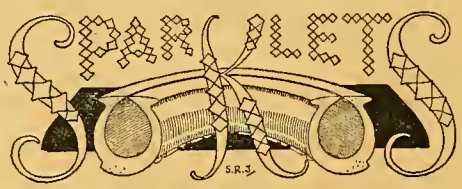
By this invention it is possible to bring the sidecar wheel into perfect alignment with that of the machine, and the sidecar frame may be arranged perfectly horizontal. For this purpose the main member A of the sidecar frame is connected to the bracket secured to the machine through a swivelling angle member B permitting its height to be varied. The sidecar

wheel is adjusted for alignment by sliding the frame in socket C, an auxiliary tube D being employed to provide additional strength.—W. H. Fulford and E. Howe, No. 21,050, 1911.

Trade Announcement.

The Continental Tyre and Rubber Co. announce the appointment of an additional managing director in the person of Mr. Paul Loeser, late managing director of the Continental Tyre Co., Paris. This gentleman will in future act as managing director in conjunction with Mr. Paul Brodtmann.

Catching Scorchers.



The Toronto police use British-made motor cycles on which to mount members of the force who are engaged in catching and prosecuting motorists who exceed the speed limit allowed by the law. The police authorities have just ordered three more Triumph motor bicycles from the Tangent Cycle Co., Toronto, which will make six Triumphs in use by the Toronto police.

Hill-climbing in New Zealand.

In the hill-climbing competition held by the South Canterbury Motor Cycle Club, on November 30th last, at Vague's Hill, near Timaru, George Patterson, jun. (2¾ h.p. New Hudson), was first, actually making faster time than the winning 3½ h.p.'s in both the open heavyweight and private owners' heavyweight classes, by over three seconds, and accomplishing the best performance of the day for efficiency.

A Useful Magneto Chart.

We have received from the Bosch Magneto Co. their coloured magneto chart, illustrating every detail of the DA 2 motor bicycle magneto. The chart is beautifully got up, and is of inestimable value to motor cyclists who desire to know their magnetos thoroughly. The Bosch Magneto Co., 40-42, Newman Street, Oxford Street, W., will supply secretaries of clubs who have fixed headquarters with one of these charts in an oak frame, 33in. × 30in. The different materials used in the construction of the magneto are coloured separately.

Tyre and Belt Successes.

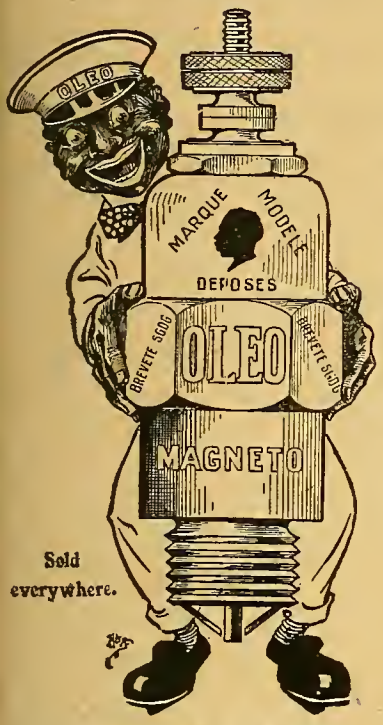
In the Herts County 100 miles trials the following prizes were captured by users of Dunlop tyres and belts: W. F. Newsome, who topped the score sheet with 191 out of a possible 200 marks, used a Dunlop belt, while Dunlop tyres were fitted to the Humber on which Fenn secured first place in Class A, and to the Rudge ridden by B. Alan Hill, silver medallist in Class B.

A Novel Adjustable Spanner.

The spanner which forms the subject of the accompanying illustration is made by Herbert Terry and Sons, Ltd., Redditch. It will be readily seen that the jaws are partly filled with a number of packing pieces threaded together in such a way that the width of the jaws can be adjusted to suit various sized nuts. One of its advantages is that it can be used in awkward places where a larger adjustable wrench of the usual type would be inconvenient to handle.

No Cement Patches.

A new tyre patch known as the Security is now being sold by A. W. Gamage, Ltd., Holborn, E.C. The business side is covered with linen. To make the patch adhere firmly it is necessary to pull off the linen, moisten the patch with petrol, and press it on the tube, which has been first of all cleaned in the usual way. If it is warmed a little after application by holding the tube on hot lamp cowl or warm radiator additional security is ensured.



Catalogues Received.

The Wood-Milne patent steel-rubber tyres and belts for motor cycles, although only recently introduced, are already in considerable demand. The new catalogue describes and illustrates the three designs of steel-rubber motor cycle tyres for which this firm is known, also the special butt-ended air tube which has no joints in the ends, and the steel-rubber motor cycle belt which is made in all sizes from ⅝in. to 1¼in. Copies of this catalogue can be obtained from Wood-Milne, Ltd., Ribble Bank Mills, Preston.

The 1912 Rex machines are described and illustrated in a neatly compiled catalogue, giving illustrations and full detailed specifications of all these well-known motor cycles. A half-tone illustration of each model appears above the specification on each page, so that the illustration can be examined at the time the specification is read—a great convenience. Detail pictures of the Rex 1912 improvements and sectional drawings of the clutch and two-speed gear, disc hubs, and cone clutch hubs are also included. Readers who are interested in these machines should address their enquiries to the Rex Motor Manufacturing Co., Ltd., Coventry.

The Dunlop Rubber Co., Ltd., Aston, Birmingham, have issued a new catalogue of motor cycle clothing, and will be pleased to send pattern bunches of the various materials to any reader.

At your Service!

Sold everywhere.

31st December, 1911.

London-Gloucester Open Reliability Trial.

Dear Sirs,

I have the pleasure to inform you that I have been successful in qualifying for a SILVER CUP in the above.

Your plug fired PERFECTLY during the entire run in spite of MUD AND RAIN, it seemed to me PARTICULARLY SUITABLE for a high compression engine like the TRIUMPH.

Thanking you for your KIND HELP.

I am dear Sirs,
Yours faithfully,
GLYNN ROWDEN.

LEO RIPAULT & Co., 64a, Poland St., LONDON, W.

Crowned by its own Successes!

For many seasons our bands have been recognised as the entirely dependable

Motor Cycle Detachable Bands.

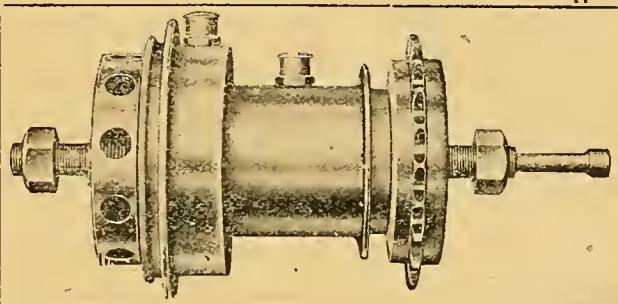
The prices are moderate, and the lasting qualities are unique. May we send you full particulars?

Roberts Belts are as good as their Bands —further recommendation is unnecessary. Illustrated particulars free on request.

THE ROBERTS MOTOR TYRE CO., Gripwell Works, St. Mary's Row, BIRMINGHAM.

"Ah, there's the rub"——

the starting trouble, and anxiety—



the pushing, running, puffing, panting—

the toilsomeness of the whole process, and—

the weariness that follows!

You know it—you have experienced it all, and—

You have longed to "glide away like a car."

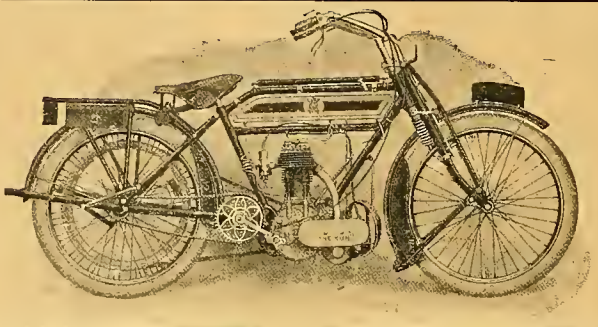
and here's the Hub

that will make that possible.

The D.H.K.

Unlike other FREE ENGINE HUBS—

In its construction there are no complications—no springs—no plates—no multiplications—ball-races—no unnecessary parts—



It simply runs on one set of $\frac{5}{16}$ balls—is half the weight of any other similar device—costs no more, and—

You press a lever and you're "off."

Now let's tell you more—write us.

The D.H.K. HUB CO.,
Mary Ann Street,
BIRMINGHAM.

"SUN PRECISION" MOTOR CYCLES

Are the outcome of 25 years' ripe experience in the manufacture of Cycles and Motor Cycles. They are made in one of Birmingham's largest cycle and motor cycle works. **We invite you to come and see them in the making.** Only the very best of everything is put into them. They have already had a royal welcome in the best quarters. You are of course aware of the hundreds of "Precision" successes.

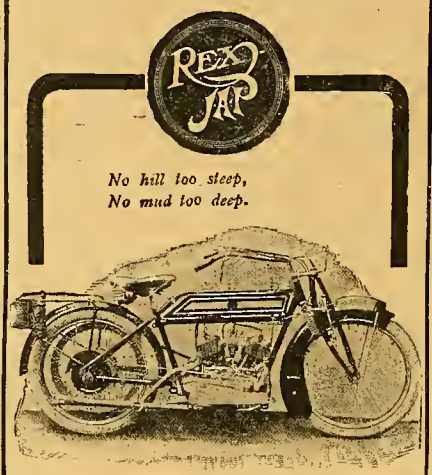
SECOND-HAND Motor Cycles.—We never hang on to second-hands. A quick turnover is what we want, and that is why we offer second-hand motor cycles at pounds below other houses. We have just received delivery of a large number of new 1912 Douglas machines and have placed these with customers who have exchanged their 1911 and 1910 mounts. You know the saying, "Once a Douglas rider always a Douglas rider." These second-hands are being thoroughly renovated, and will be cleared at bargain prices. 1910 Douglas, from £22; 1911 Douglas, from £27. £25 spent on a Colmore Douglas will prove a fine investment. Let us send you a list of about 60 really good second-hands in stock.—Colmore Depot, 27, Colmore Row, Birmingham.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.



4h.p. Werner Twin, in good running order; bargain, £12.—Risdon, 32, Wellington St., Luton.

1¾h.p. Motosacoche, F.E., little used; cash £20, or exchange.—Wallis, 157, Mill Rd., Cambridge.

1912 Ariel, 3½h.p., 3-speed gear, free engine, just delivered, never ridden; £55.—Hewat, Southwold.

1912 Bradbury, free engine model, in stock; first cheque £54/10 secures.—Willmott Bros., Norwich.

1912 Rover, free engine model, £55/5; also 2½h.p. Twin Centaur, £42; both in stock.—Willmott Bros., Norwich.

No hill too steep,
No mud too deep.

1912

REX-J.A.P. Motor Cycles

have been designed throughout for the discriminating owner who sets *value before mere cheapness.*

The power and flexibility of the J.A.P. Engine, the luxuriously comfortable front and rear springing, the large tyres, automatic lubrication, and efficient silencing, combined with the neat and clean cut appearance of the machine, justify our claim that it is the most practical and efficient motor cycle on the market.

***The result of experience** gained by riders of all makes of machines, the REX-J.A.P. combines all that is necessary for easy starting, traffic riding, long journeys in fair weather or foul, and is undoubtedly the*

only satisfactory machine for sidecar work.

Catalogue, describing the many luxurious and exclusive details of these unique machines, free upon request.

TO DEALERS—The REX-J.A.P. Agency proposition is worth consideration—we invite your correspondence.

COLONIAL AGENTS—The REX-J.A.P. Colonial Models, with *Special Frame, Wheels, and increased ground clearance,* will interest you. We are now appointing Sole Agents, and shall be pleased to post you terms.

MOTOR BICYCLES FOR SALE.

TRIUMPHS, Bradburys, B.S.A.'s, Humbers, Rudges, Enfields, Premiers, Matchless, from stock.—Lambert, Thetford.

BAROAINS.—1911 3½h.p. Premier, £28; 1911 3½h.p. Bat, £28; 1911 2h.p. Humber, £28; Motosacoche, magneto, £15.—T. H. Nice, Bury St. Edmunds.

NICE and Co., Bury St. Edmunds.—For immediate delivery, Humbers, New Hudsons, Premiers, B.S.A. Exceptional allowances for old machines.

TRIUMPH, free engine, 1909, Bosch magneto, nearly new Kempshall back, footboards, whistle, etc.—Brockbank, Toftrees, Fakenham, Norfolk.

1912 L.M.C. Motor Cycles; immediate delivery; trial runs and interviews by appointment.—W. E. Sneezum, 14, Fore St., Ipswich. Sole agent Ipswich and district.

BS.A.! B.S.A.! B.S.A.! — Early deliveries of all models of these celebrated machines; second-hand machines part payment.—A. F. Garnham and Co., sole agents, Ipswich.

SECTION VI.

Worcestershire, Herefordshire, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

2¼h.p. Twin Enfield, new, not used; bargain, £32/15. —62, Cardiff St., Aberdare.

1909 Triumph, perfect condition throughout; £30, or good offer.—Weale, Leominster.

BOOK Your Order early for Clynos. At present I can guarantee delivery this month.—Below.

IMMEDIATE Delivery 1912 3½h.p. and 6h.p. Zenith, Triumph, Rudge, B.S.A., Singer, Humber, New Hudson.—Clarke's Garage, Port Talbot.

BS.A., new June, standard model, excellent condition, perfect order; £35.—Bevan, Brookfield, Troedyrhiw, Glam.

FOR Earliest Deliveries of Triumph, Humber, Enfields, Singer, Premier, apply at once, Griffiths, Cycle Emporium, Llanelly.

1911 Brand New Rex de Luxe, single, 2-speed; offers or exchange second-hand mount and cash.—Robathan, Guarlford, Malvern.

TRIUMPH, 1912, March; cannot take delivery; give lamp to take over.—Box No. L5,864, *The Motor Cycle* Offices, 20, Tudor St., E.C.

2h.p. Minerva, Triumph low frame, B. and B. carburetter, h.b.c., good condition; £8/10.—A. Nash, Bay Horse, King's Acre, Hereford.

DOUGLAS, 1911, 2½h.p., just thoroughly overhauled by makers, new tyres, belt, lamp, horn, mirror, watch; bargain, £30.—1, Partridge Rd., Cardiff.

REX, 3h.p. 1909, Bosch, Amac, tyres perfect, lamp, generator, horn, numerous spares; bargain, £16; must sell; genuine.—Smith, builder, Ledbury.

TRIUMPH, 1911 standard model, £37; 1911 free engine model, £43; 1910 free engine model, £36; all in good condition.—Stour Cycle Depot, Stourbridge.

MATCHLESS 1911 Standard Roadster Model, perfect condition throughout; £34, bargain.—Withers, High St., Stourbridge.

DOUGLAS, 1911 model E., with 2-speed gear and free engine, condition perfect; £38.—Stour Cycle Depot, Stourbridge.

ENFIELD 1910 Lightweight, with 1911 improvements, in fine condition; £24.—Stour Cycle Depot, Stourbridge.

3½h.p. Brown, accumulator, B. and B., h.b.c., All'All forks, new Lycett saddle, good running order, only wants new tyre; £4/10.—Dunn, Cross Keys, Moo.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks Wilts, and Hants, and Channel Islands.

2¾h.p. Enfield, new July; £45.—McBride, Lucknam, Chippenham.

2¾-3h.p. Motor, Chater-Lea, 26 wheels; bargain, £7.—West, Whitehill, Bordon.

DOUGLAS, 1911, 2-speed, perfect condition; £35.—Wasley, 9, Victoria St., Bristol.

2½h.p. Motor Cycle, reliable, good order; £11.—G. Trinder, Market Place, Cirencester.

3½h.p. Rex, low built, engine and tyres in splendid condition; £5.—41, Landguard Rd., Southsea.

1909 Triumph, very little used, £32; 1911 Triumph, perfect, as new, £38.—Watts, Rosemont, Lydney.

1911 New Bradburys, standard and 2-speed models; bargain prices, cash offers. — Ginger, Motors, Banbury.

1910 Triumph, clutch model, perfect, and good condition; £36, or nearest offer.—3, Alma Court, Newbury.

P. AND M., 1911, 3½h.p., new Kempshall tyre, perfect order. — Davenport Vernon and Co., High Wycombe.

Internal Progression—*not* Dissension.

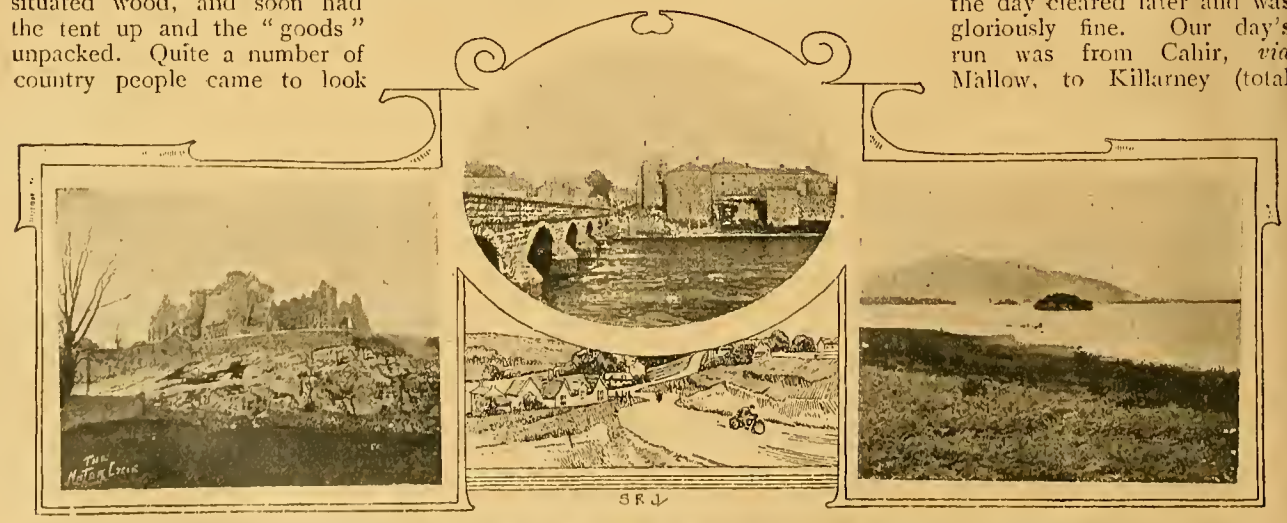
THE news published elsewhere this week regarding the formation of a new body entitled the Motor Cyclists' Progressive Association will cause surprise to a large number of our readers. Those, however, who are more in touch with motor cycle politics already know that a good deal of dissatisfaction has existed for some time among A.C.U. members and members of clubs affiliated to that body, and there is a general feeling that there should be less of the car and more of the motor cycle element in the management of the A.C.U. While we should have thought that it was quite possible to bring about necessary reforms without the formation of a fresh association, the manifesto that has been issued makes it very clear that the desire of the progressives is not in the slightest degree antagonistic to the present governing body, and there is no suggestion whatever of forming an opposition government. It is, however, felt that there should be more active motor cyclists upon the general committee and sub-committees of the A.C.U., and for this purpose the progressives have banded themselves together to secure more complete representation upon the executives without doing anything which might be damaging to the Union.

Another point which should not be overlooked is that membership of the Progressive Association is confined to members of the A.C.U. and its affiliated clubs. Now while we are still of the opinion that all the proposed reforms would have been possible without the formation of any fresh body, it will be readily recognised that very much more prompt and efficient amendments may be brought about by properly organised methods. One of the objects of the progressives is largely to increase the membership of the Auto Cycle Union, and if they can do this we promise them our whole-hearted support. They do not tell us how they intend to do this. There is no doubt whatever that autocarists, unless they are also motor cyclists, seldom see eye to eye with motor cyclists, who are nothing if not keen, but have we any evidence that a single shortcoming of the A.C.U. is due to the car element? It appears to us to be largely a matter of sentiment rather than fact.

Taxation of Business Motor Cycles.

THE article published elsewhere on the taxation of business motor cycles will be read with interest, particularly that portion which mentions that the Auto Cycle Union has decided to test the legality of the demand made by the local taxation authorities that all motor cycle owners must pay the £1 tax, even if their machines are only used solely for the purpose of carrying goods in pursuit of their business. The authorities argue that a motor cycle cannot be exempt because it is constructed for carrying a driver.

Would the authorities argue that a motor cycle or cart could be used without a driver? The argument that because a motor cycle is constructed for the conveyance of a person as well as goods it is placed outside the exemption clause is one of the most absurd contentions we have ever heard. Thousands of spring carts are used daily without the payment of a penny, not only for carrying goods for the purpose of business but also for conveying friends. The only time when an untaxed cart is legally entitled to carry passengers is when the vehicle is required for the attendance of the owner and his family at Divine worship. That they are used for hundreds of other purposes is well known.



A SIDECAR TOUR IN IRELAND.

THIS is a short account of a sidecar tour in Ireland last summer, done with the aid of a 1907 Triumph and a 1910 5 h.p. Indian, both fitted with Chater-Lea rigid sidecars. Four of us left Dublin on July 28th, 1911, about 11 a.m., for the South, with the above machines and the following hastily-gathered equipment: A small folding bicycle tent, size 6ft. 6in. × 6ft. 6in. × 6ft., weighing 9 lbs.; a portable Primus stove, four military type mess tins, a large motor car cover to act as a ground sheet, four rugs, and a very limited supply of spare clothes. A couple of plugs, valves, a big pulley for the Triumph, and a spare set of new chains for the Indian, were all the spares we carried. Our tyres had seen a deal of use, but were in good condition. The day of our start was fine, but the roads were heavy, due to a wet night. Near Naas (twenty miles) we had our first stop to scrape the Triumph's belt, which was slipping (this was the only occasion during the tour that it was touched). We had soon passed Newbridge, and, crossing the Curragh, arrived at the old cathedral town of Kildare, where we got a view of the ruins and the Round Tower. Nearing Monasterevin, the new spare chains were found to be missing from the Indian's carrier, though they were there a short time before. We went back to search and make enquiries, but no news was forthcoming. This left us with only the old pair, and these had done nearly 3,000 miles —a bad start, but we were in a happy-go-lucky mood, and we did not care a —— what happened as long as we got somewhere somehow. We lunched by the roadside near Maryborough—tea, bread and ham. In Maryborough (fifty miles) we purchased provisions and despatched postcards to doubting ones. The afternoon's run was through Abbeyleix and Durrow over a fine level and, in most parts, steam-rolled road. Everywhere we went the sidecars, or "baashkets," as they were called, were looked on as things of wonder, as very few are seen in Ireland, especially in the country parts. Just outside Cashel the Indian ran short of petrol, and having no more we decided to camp for the night. We stopped near a very nicely-situated wood, and soon had the tent up and the "goods" unpacked. Quite a number of country people came to look at us, wondering what kind of folk would live in a tent and drive in "thim things." From these good persons we found out who owned the field, and then proceeded to ask permission from him to use his land to camp on. His son gave us the necessary leave, and showed a great interest in our machines, as he was the owner of one of the earliest Bats made, which was still going strong. Having been under canvas for a fortnight before our tour, we found no difficulty in quickly getting asleep in our blankets.

Thunderstorms.

We finished our breakfast early next morning, and soon got away to Cashel. This little town is famous on account of the interesting tenth century ruins on the "Rock" which stands right beside the town. This rock came, it is said, as a result of an argument between his Satanic Majesty and a famous Irish giant, Finn Macoole. We explored the ruins for some time, going up and down dark stairs built in the thickness of the walls, and emerging at the most unexpected places. Having satisfied our interest in this historic spot, we filled up with petrol and got on our way to Cahir. As we approached this place it became very dark, and we could hear distant thunder. On entering the town the gathering storm burst upon us in full force. We made for the hotel yard, and got the machines under cover before they got very wet. There was a fearful storm all day; few of the inhabitants ever remember having seen worse lightning and rain. We made several attempts to get away to Killarney, and at about five o'clock succeeded in starting. However, we had hardly gone more than a mile when the storm again came upon us. The Triumph at this time was leading by about 200 yards, and by going "full out" got to Mitchelstown before the storm. The Indian was not so lucky, and got the full force of the tempest, but enjoyed true Irish hospitality in a small cottage while sheltering from the rain, later going back to Cahir to the hotel for the night, while the Triumph stayed at Mitchelstown.

The following (Sunday) morning was still wet, but the day cleared later and was gloriously fine. Our day's run was from Cahir, *via* Mallow, to Killarney (total

(2) King John's Castle and bridge over the Shannon at Limerick.

(3) Part of the lower lake at Killarney, showing "Purple Mountain" in the distance.

A Sidecar Tour in Ireland.—

203 miles from start). The last forty miles lay over a fearful road, very bumpy and wet; for long distances it was sharply sloped to one side, giving one the impression that the sidecar was going to turn over. The Triumph arrived first at Killarney by about an hour on account of the "Indians" stopping in Mallow for lunch. On resuming the journey after lunch they found themselves the objects of some considerable notoriety, for, on turning a certain corner, they met a cart load of people who immediately began one and all to curse with great vehemence. A number of other carts and cars were met, all the inmates of which loudly reviled the bicycle as it passed; at one place men by the roadside could hardly resist stoning the machine for "coming a second time at them." It was not till that night when Triumph and Indian again met that the meaning of this strange behaviour became evident. Perhaps some of your readers are unfamiliar with the spectacle presented by a large country funeral in Ireland. First come the cars for the officiating priests, then the hearse, followed by about one hundred or so cars and carts; after these walk other mourners, and the whole procession is closed by a cavalcade of thirty or forty horsemen riding three abreast. The Triumph had unluckily met this procession, and as each component part had tried to reach the nearest field by the shortest route (*i.e.*, the hedge), we didn't wonder at the language used when the Indian passed, especially as the people thought it was the Triumph coming round after them again! We talked over our adventures that night round a splendid turf fire, and then retired to the tent for a well-earned sleep. We were away early next morning, having been disturbed by cows endeavouring to browse on the tent. We left our machines in a Killarney garage for the day while we went to visit some of the world-famed sights and views. We paid sixpence each to go by a short cut to the lakes and Ross Castle, being told we would save a half mile walk; however, we walked nearly three miles, and then found that the long way was only threequarters of a mile. After having some lunch in a cottage we got a boat to go to the celebrated island of Inisfallen, where the boatmen informed us we should see the holly tree under which Brian Boru learnt to play the piano. A strong gale was blowing down the Gap of Dunloe, and, owing to this, there was quite a sea running on the usually placid lake. By the time we got over to the island we were rather wet, and had shipped quite a quantity of water. We stayed some time on the island, but were unable to find either the holly tree, piano, or yet Brian!—our guide having to stay with the boat on account of the bad sea.

Inner door of Cormac's Chapel, Rock of Cashel.

A Broken Pulley.

Just as we were leaving, down came the rain, wetting us through and through, though it calmed the lake at once. It stopped when we got near Ross Castle, and we managed to get fairly dry by walking quickly back to the town. As the weather was threatening a wet night, we decided to push on at once for Tralee (230 miles); we were soon away with, luckily, the hurricane of wind and rain at our backs, over the best road we met in Kerry. Just outside Killarney the Triumph belt refused to grip, and an examination revealed that the inner flange of the engine pulley had come adrift. As it happened, the big pulley for solo work was in the sidecar, and this was quickly fitted. Misfortune also befell the Indian, for about half way to Tralee the front chain broke. The big ground sheet was placed right over the combination to keep off the rain, and in a dry but very stuffy atmosphere we soon effected a repair. On account of the rain we put up for the night in Brenner's (I.A.C.) Hotel, where we were made very comfortable. We decided to get to Limerick (296 miles) as early as possible next day, as we wished to see some of our University friends playing cricket there. The road was bad to Listowel, and also from there to Glin; but from Glin along the estuary of the Shannon both the scenery and surface were excellent. We passed Foynes, where there are big petrol and petroleum tanks for storing the cargoes of the tank ships. For three miles outside Limerick the road was easily the worst in creation! —4 m.p.h. being about the limit. And even at this speed one would think that the frames and wheels could not possibly stand the strain. We spent the afternoon with our friends, and in the evening two of us sought a suitable camping ground. This was successfully found, and we owe a great debt of gratitude to our hosts for their kindness to us in making our stay so enjoyable.

The Roads of Tipperary.

The next morning was very wet, and we put off our departure till two o'clock to see if the weather would take up, but there was no improvement. Birr (361 miles) was our objective, so, having taken leave of our host, we made haste to get the wet and muddy journey done. Nenagh was soon passed, not without incident, however, for just beyond it the Indian front tyre deflated. This proved to be due to wet getting in through an old cut. We patched the tube and cover while, luckily enough, the elements for the time were favourable; we managed to make such a good job of it that the tyre lasted nearly another 2,000 miles. The Triumph did not stop, but went on to Birr, *viâ* Roscrea, to visit some friends, but, as it was getting rather late, the Indian went direct to Birr from Nenagh. The roads in North Tipperary are easily the best in Ireland, being all steam-rolled; and it is a common thing to see reports in the papers of other county councils making excursions to Tipperary to see the road making. The "Indians" had a wash, dry clothes, and tea in Birr before the Triumph arrived, and we all then went to visit a college chum. Here we met with the greatest hospitality, for we were immediately invited to supper, to put our tent on the lawn, and sleep on large quantities of dry blankets,

and, on the morrow, to breakfast in the house and to golf all day. So in every way we spent a glorious time entirely. That (Thursday) evening we arranged to get to Athlone (476 miles), where, right in the town, the other old chain on the Indian broke.

A Cold Camping Place.

As it was dark we decided to have supper, and to leave the Indian in the hotel, then to walk out along the Roscommon Road and find some nice place to camp. It was past midnight, when we found a place and got the tent up with the aid of the Triumph's lamp. We were camped, on an old "rath" or fort which overlooked the Shannon as it emerged from Lough Ree, from which a damp mist was rising, chilling us to such a degree that sleep was impossible. We rose about 3 a.m., and made a big fireplace of stones in which we made a cheerful blaze of dry wood that we were glad to find in plenty round about. Later on we gathered mushrooms, which were simply splendid stewed for breakfast. The sunrise over Lough Ree was superb, and we soon enjoyed a good view from our lofty rath of the lough, the river, and the town of Athlone. After mending the broken chain, tracks were made for Sligo (476 miles). A few miles from Athlone we noticed that the chain in breaking the night before had made a hole in the oil tank. Luckily we had a spare tin of oil which carried us as far as Roscommon, where we got a cycle repairer to mend the hole. Though it was a long and tedious job the charge was only 1s., which was very moderate, especially as we were diverted while waiting by the following conversation: "The races were grand yisterday, Moike." "Yis! but you should have seen the grand sight in the station last night; the platform was stretched with dhrunken min, and sarra wan arristed at all at all!" Truly a fine sight!

Old church and round tower, Glendalough.

A Long Hill and Fine Scenery.

In Boyle we took in petrol, oil, and food, and proceeded to Sligo up the worst hill we encountered on the tour. This hill is 1½ miles long, with an average gradient of about 1 in 12 and some seven or eight hairpin bends. By shedding the passengers three-quarters of the way up both bicycles managed the climb, though we might have got up passengers and all if we had known of the hill. When we got to the top the scenery was magnificent, and would compare with anything we saw elsewhere. We spent the evening at Rosses' Point, five miles beyond Sligo, where we met several college friends. The next day (Saturday) we spent playing golf at Rosses' Point, and we were going to spend a second night there, but as we heard that there was a camping fee of 10s. we left in a hurry. It came on very wet at night, and after we had gone about five miles towards Bundoran, on stale petrol, by the way, that we took in at Sligo, we decided to camp for the night. It took us some time to find a suitable place, but after a time we were very kindly allowed to sleep in a hay barn, and a real good sleep we had. It was 11 a.m. on the Sunday before we got up, but by 1 p.m. we were away to Donegal (524 miles) *via* Bundoran and Ballyshannon. We had great difficulty both in starting and hill-climbing with the stale petrol, but managed to get to Bundoran, where we emptied our tanks and filled up from fresh tins of Shell. In Ballyshannon we were held up on a steep hill by a rather unusual sight—a man driving a large flock of over 200 geese; what he was doing with them was more than we could find out, but they baulked us badly on the hill and we had to shove up. A few miles from Donegal the Indian sidecar tyre burst with a loud report—showing a rip

Gap of Dunloe, Killarney. The ascent is made on donkeys and mules from "Kate Carney's Cottage."

A Sidecar Tour in Ireland.—

a foot long in the cover and tube. As this was unmendable, we got a farmer to cart the sidecar and the passenger to Donegal, the Indian going on solo We camped for the night on the lawn of a gentleman's house, where we spent one of the most enjoyable evenings on tour, talking over every kind of subject with our host. We have heard since that we were the cause of his getting a motor cycle for himself. As one of our party lived quite close to Donegal we decided to send the damaged sidecar back to Dublin by rail, while the Indian continued solo. Our tour proper ended next day at Dunfanaghy (580 miles), which we reached in the evening *via* Ballyboofey and Letterkenny.

Conclusion.

We all enjoyed our tour despite the bad weather we encountered. Each alternate day was wet with the exception of the last. The total cost of our trip, including two wet nights in hotels, was only £1 16s. 4d. The machines behaved splendidly, the only trouble resulting from the Triumph's pulley and the Indian's worn chains breaking. We were very lucky with our tyres; the front tyre of the Indian punctured once, and the sidecar tyre burst, owing to an original defect. This the manufacturers have since replaced free of charge. The roads on the whole were very good; the forty miles from Mallow to Killarney, and the three miles outside Limerick being the only really bad bits. There were practically no loose stones on the roads, which was a boon from the point of view of punctures. Our tour was unplanned, and we only travelled each day as far as we felt inclined. We decided to leave out Connemara till a future date on account of the high gear (4½ to 1) on the Triumph due to the small pulley breaking, which made hill-climbing with sidecar difficult. We met with the greatest hospitality from all classes; people did all they could to make us comfortable, and all seemed greatly interested in the sidecars and our adventures. All said and done, Ireland is not a bad country to tour in during the fine weather, and many could have a better holiday in Ireland than wandering over the Continent in foreign lands, of which Ireland is not one, and we hope never will be.

TRIUMPH AND INDIAN.

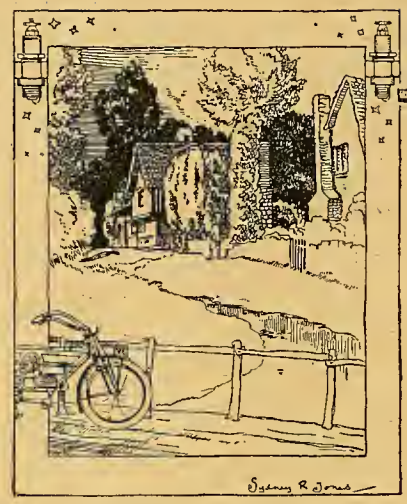
A SOCIABLE SIDECAR.

THE accompanying photograph shows an interesting conversion by an amateur rider, Mr. Dobson, who is a student at St. Bartholomew's Hospital. The motor bicycle is an old Vindec, fitted with P. and M. two-speed gear and chain drive, which he bought second-hand. Mr. Dobson, with the assistance of a local cycle repairer, added wheel steering and a double-seated sidecar, and appears to have made a very satisfactory job of the conversion. The framework of the attachment gives one the impression of being strong and rigid, and the long arm from the motor bicycle steering head to the exterior of the sidecar frame gives additional strength. The sidecar body is supported on three leaf springs. We had a short ride in the combination recently, and it proved itself to be controllable, comfortable, and handy in traffic. It will be noticed that the control levers are on the wheel, and the exhaust lift is below the bracket on which the wheel is carried. Both brakes (not shown in the photograph) act on the rear wheel—one is hand-operated and the other is worked by means of a pedal.

An amateur's conversion. This two-speed Vindec with the addition of a double-seated sidecar makes a good sociable vehicle.

A SIDECAR WITH SHEET METAL BODY.

ANOTHER sidecar, of which we publish an illustration, was recently brought to our notice by Mr. W. W. Lake, of Freeland Road, Ealing Common, W., and, as will be seen, is fitted to a 6 h.p. twin N.S.U.



Mr. and Mrs. W. W. Lake and their 6 h.p. N.S.U. sidecar combination.

In writing us Mr. Lake remarks: "The sidecar body was manufactured to my order by the Brighton Motor Sheet Metal Works at a most reasonable cost. The body being made of sheet metal might be thought a trifle heavy, but it does not affect the running in the slightest. The upholstery is properly sprung, there is a side entrance door, and a novel feature is the valanced apron which clips over the side of the car. One of the advantages is that the body is made to fit the ordinary 'basket' chassis."

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Registration.

I have purchased an A.C. sociable. The weight of this unladen is over 4 cwts. Shall I require to register this as a car? Will this be charged as a car for the Revenue licence, or as a motor tricycle with the 20s. licence?—"A.C. SOCIABLE."

The machine will have to be registered as a car, but the local taxation licence, as the machine has not more than three wheels, will be that of a motor cycle.

Sticking of Contact Breaker Arm.

Could you inform me the reason why, as I find it is by no means uncommon when a motor cycle has not been used for some days or weeks, the contact breaker of high-tension magneto refuses to work, the points remaining apart and refusing to close? I should also like to know the quickest means of again getting the contact breaker to work, as I find that after working it with the fingers for an hour or so it again works correctly, and continues to do so until the machine is not used again for some days consecutively.—A.J.W.

The rocking arm sticks because the fibre swells slightly with the damp, and possibly causes rust on the pin. What you must do is to take the contact breaker off, remove arm, clean the pin with fine emery paper, and ease the hole with a piece of the same wrapped round a small piece of wood, such as a wooden match. A small drop of oil should be applied to the pin, any surplus being wiped off.

The Difference between Old and New Machines.

(1.) I now ride a 1907 3½ h.p. Triumph and sidecar, and get a great amount of pleasure from it. I never have the slightest trouble with the machine, and I started as a novice. Should I get more power out of a more modern mount? (2.) Is a more modern machine only an improvement in details with the same actual horse-power? (3.) I have had an offer of a 1910 Triumph with Gradua gear. Would this be worth changing for, and is a Gradua gear recommended as a free engine by which to start?—BOXER.

(1.) You would certainly get more power out of a modern machine. (2.) The engine is more efficient. (3.) This machine with Gradua gear would enable you to climb almost any hill without trouble, but it would be a little bit harder on the belt than if the machine were used with a moderate fixed gear. It is not advisable to start by means of the belt. It is better to adjust gear fairly low and push to start, in the ordinary way.

Riding Through Water.

I want a thoroughly reliable machine for *all* weather and roads, and one easy to manage, and not requiring frequent adjustments, and a safe conveyance when the roads are bad. I have to ride in all weathers, and have to keep appointments for certain times. With regard to the Clyno, I should like to know particularly—(1.) Whether it is a good sidecar machine? (2.) Reliable in the hands of an amateur? (3.) If it is a good solo machine? (4.) Accessibility for repairs and adjustments? (5.) Accessibility of back wheel for repairing tyre and also changing the tube and outer cover. (6.) Is the back tyre large and strong enough to withstand the wear to which it will be subjected? (7.) Are the mudguards sufficient for bad weather? (8.) Is the machine generally, and particularly the magneto, weather-proof? (9.) In this district there are many places where a small stream crosses the road, with only a narrow footbridge across, over which with care, one can get a bicycle, but it would be impossible to take a motor cycle and sidecar over the bridge. In summer the water would be shallow, but in winter it often floods over, and soon gets a foot and more in depth. Could one get through it on a motor cycle without stopping it or damaging it, and is it better to go slowly through such places? (10.) Is it better to have a castor or rigid wheel for the sidecar?—W.B.H.

(1.) The machine in question is one of the best sidecar machines on the market. (2.) It is reliable in the hands of an amateur. (3.) It is a good solo machine, but, of course, rather heavy. (4 and 5.) It is accessible for repairs and adjustments, also as regards the back wheel for tyre repairs and tyre changing. (6.) The tyre is strong enough. (7.) The mudguards are quite good. (8.) The machine is particularly good as regards protection of the working parts from the weather. There are valve covers, chain covers, and the magneto is well protected. (9.) You could probably just scrape through if the water were a foot deep, provided the surface were hard underneath, and the ford taken very slowly. (10.) A rigid wheel sidecar would, we think, be more satisfactory, as it prevents side-slip.

Automatic Inlet Valves and Overheating.

Will you tell me if automatic inlet valves cause overheating? I was troubled all last summer with the front cylinder of my twin 5 to 6 h.p. (1907) overheating. Do you think a 5 to 1 gear is too low for the South of England with a sidecar?—J.D.

It cannot be said that automatic inlet valves cause overheating. Perhaps if you reduce the lift of these and see that it is the same in both cases (also the tension of the inlet valve springs) the engine will run cooler. 5 to 1 is not too low for sidecar work.

Middlesbrough to Oakenshaw.

(1.) Would you kindly give me the best route from Middlesbrough-on-Tees to Oakenshaw, near Bradford, avoiding very bad hills and large towns? (2.) What is the distance?—W.J.W.

(1.) Your best route would be as follows: Middlesbrough, Yarm, Tontine Inn, Thirsk, Ripon, Ripley, Harrogate, Pouler, skirt Yeadon, go through Little London, straight on to Bradford, past Earshill Station take the first turning on the left, turn left again, pass under the railway bridge, and turn first right past the hospital, and ask your way to Dudley Hill Station. Do not go direct to the station, but follow the road through to Oakenshaw. This cuts out practically the whole of Bradford. (2.) The distance would be approximately seventy miles.

A Novice's Queries.

I have my first motor cycle—a free engine plate clutch 1912 Triumph—on order, and not having previously ridden a motor cycle I shall be very pleased to learn: (1.) What are the probable results (if any) to contents of the tank and engine after, say, a corner "spill"? (2.) Has the petrol or the petrol-mixture any tendency towards explosion, or other danger, owing to a sudden overturning of one's motor cycle? (3.) I have bought (from a motorist) a cycle house with corrugated iron roof, etc., and am surprised to find several ventilation holes bored in one of the sides—will this not (although an exit for evaporation) cause dampness?—W.B.G.

(1.) A little petrol will be spilt and that is all. (2.) There is no reason why there should be an explosion unless the petrol were to leak directly on to a nearly red-hot exhaust pipe or lighted lamp. (3.) We should not think that the ventilation holes would matter in the least, unless they are so big as to admit much damp.

A Sidecar on a 2¾ h.p. Machine.

I have just purchased a Douglas motor cycle, and am a complete novice, so would you please tell me whether it would injure the machine to use a sidecar occasionally with a light-weight passenger (my own weight is under 11 stones) in the district around the South-east of London? —L.A.C.

We do not know that it would actually injure the machine to use a sidecar with it, but, in our opinion, this power is insufficient, especially in the district round the South-east of London, where the country is somewhat hilly. If you wish to take a sidecar you should go in for something more powerful, though, as a solo machine, there is nothing better than the make you have chosen.

Motor Cycle Associations.

I desire to join one of the motor cycle associations, but am in ignorance as to which is the best. Is the A.C.U. a branch of the R.A.C.? What is the A.A. the sign of? Also what is the M.C.? I shall be pleased to receive your explanations, stating subscriptions and method of joining.—H.P.

The Auto Cycle Union is the body to which the Royal Automobile Club has delegated the control of motor cycling matters. The subscription for a touring member is 5s., and this is the cheapest organisation to which you can belong. The Automobile Association and Motor Union are now amalgamated. The subscription for a motor cyclist member is 10s. 6d. Full particulars can be obtained from the secretaries of these two bodies—F. Straight, the Auto Cycle Union, 89, Pall Mall, S.W., and Stenson Cooke, the A.A. and M.U., Fanum House, Whitcombe Street, W.

Brighton to the Lakes and Back.

I am touring from Brighton to Penrith, then to Richmond (Yorkshire), on to York, and back again to Brighton. Will you please tell me the best way to go without touching Manchester or Sheffield or such like large towns. I don't mind bad hills so long as I can get good scenery. I wish to call at the following places: Reading, Sutton Coldfield, Haddon Hall, and Windermere. I should like to know the distance.—E.C.S.N.

We should recommend the following route: Brighton, Henfield, West Grinstead, Billingshurst, Rudgwick, Shalford, Guildford, Bagshot, Wokingham, Reading, Panghourne, Wallingford, Oxford, Deddington, Banbury, Warwick, Kenilworth, Coleshill, Sutton Coldfield, Lichfield, Abbots Bromley Uttoxeter, Ashbourne, Hartington, Haddon Hall, Bakewell, Buxton, Macclesfield, Harthall, Knutsford, Northwich, Runcorn, cross the River Mersey by transporter bridge and proceed through Rainhill, Rainford, Ormskirk, Rufford, Longton, Preston, Lancaster, Carnforth, Kendal, to Windermere. Proceed to Penrith by skirting the shores of Ullswater. The return journey should be made through Brough, Bowes, Scotch Corner, Richmond, and then on to York, continuing through Tadcaster, Ferrybridge, Doncaster, Bawtry, Retford, Newark, Grantham, Stamford, Wansford, Stilton, Buckden, Eaton Socon, Biggleswade, Baldock, Stevenage, Welwyn, Hatfield, St. Albans, Watford, Rickmansworth, Uxbridge, Colnbrook, Staines, Chertsey, Guildford, Shalford, Cranleigh, Horsham, Cowfold, Henfield, to Brighton. The distance is approximately 790 miles.

READER'S REPLY.

I see "E.L.S.M." asked your opinion on February 1st concerning the general reliability, speed, and hill-climbing capabilities of the 3½ h.p. Lincoln Elk, and how it is made at such a comparatively low price. Well I will tell you, and perhaps you will be good enough to explain this. In the first place, I make practically everything on my own premises and my establishment charges are very low. Labour is very much cheaper in Lincoln than in Coventry, and I do not keep trade riders for racing or expensive trials, but make the motor for every-day use, where reliability is required. For all-round work, for business or pleasure, for speed and hill-climbing, it is good, but I do not make it as a racing machine.—J. KIRBY.

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"J.P." (Leicester). Coach-built *v* wicker and cane sidecar bodies.

"C.E.J." (Old Colwyn). A.S.L. single and twin.

"H.B.C." (Southampton). A.L. generator, dry batteries, and electric lamps for economy and reliability.

"G.J.K." (North Shields). 3½ h.p. three-speed New Hudson.

"Alcestras." A.C. sociable in a medical practice.

"J.H.C." (Leeds). Lincoln-Elk.

"J.P." (Dulwich). Binks two-jet carburetter on an 8 h.p. Jap runabout; ease of starting, slow and fast running.

"W.A.F." (New Zealand). 8 h.p. Bat-Jap solo; wear on tyres and belts, and petrol consumption.

"F.S.J." (Wimbledon) 5-6 h.p. F.N. with sidecar.

A quaint street in Peel, Isle of Man (overlooking the harbour).

A WINTER RIDE IN THE SNOW.

ON Thursday, the 1st inst., a number of members of the Harrogate Club had decided to ride over to Scarborough to hear the lecture which was to have been given there by Mr. J. L. Norton. Nothing definite had been settled regarding the time of starting, etc.

At night we went to bed fully expecting to have a good ride next day, on hard, frosty roads, and we were naturally somewhat surprised, when waking up next morning, to find the ground deeply covered with snow and a perfect blizzard raging. Of course, all thoughts of Scarborough were immediately put out of our heads, but nevertheless, when a number of us met together on the Friday morning, various statements were made as to its being possible or otherwise to get to Scarborough before midnight—a distance of sixty-two miles—if Harrogate were left at twelve o'clock, midday.

The usual offer of slight odds was made and immediately accepted by W. E. Grange, who stated he would ride a 2½ h.p. three-speed Premier. His friend, C. Wilson, then agreed to accompany him on a two-speed Douglas. After these two had departed to attend to their machines, T. W. Monkhouse stated he would ride the distance in the same time on an ordinary push-cycle if anyone would bet him 100 to 1 he could not do it. This bet was settled, and he went away for his machine.

The Start.

Just after twelve o'clock Grange and Wilson started, and by this time the weather overhead was beautiful, and remained so for the rest of the day, although a nasty north-east wind had a tendency to retard the riders' speed.

Wilson took the wrong road at Knaresborough, which lost about fifteen minutes' valuable time, and from here to Green Hammerton the riders came up with the snow plough at work. A further stop of about one hour was made at this village to allow the plough to do some useful work. Slipping belts and a broken one caused further loss of time; snow-drifts were also a source of trouble, and in more cases than one the motor cyclists had to help each other to drag their machines through.

York, a distance of twenty-two miles, was reached at 3.20, and here the riders stayed for some time. Getting on the way again, the roads were found to be rapidly improving, and Malton, eighteen miles away, was reached at five o'clock. Here petrol, etc., was taken aboard, and at Sherburn a stop was made for tea. After Sherburn a good many more drifts were experienced, but without further trouble Scarborough was reached at 7.15, making just over seven hours for the sixty-two miles.

Old Records.

But in the meantime what was happening to the push-cyclist, who, by the way, will this year reach the age of fifty-four? From 1897 to 1910 he held the twenty-four hours Yorkshire (paced) record of 347¼ miles. From 1908 to 1909 he held the world's unpaced twenty-four hours' record of 304¾ miles, and he has also held the twelve hours' record at various times. In 1891 he finished fourth to Shorland (1), Walsh (2), and Bidlake (3) in the North Road race, which was run in pouring rain with about fifty starters. You will see, therefore, he is (or was) by no means a feeble individual in sports. *Revenons à nos moutons*, as the French would say. We find Monkhouse leaving home at about one o'clock, and taking slightly over twenty minutes to do the first three miles. From Green Hammerton to York proved the worst, and near Skip Bridge the rider found it necessary to carry his machine for nearly a mile; and, in spite also of a fall whilst watching some youngsters sliding, he arrived

(1) T. W. Monkhouse, the push cyclist, starting off for his sixty-two miles ride through the snow.

(2) Group at the start of the ride. The two motor cyclists are: (left) C. Wilson (2¼ h.p. two-speed Douglas). (right) W. E. Grange (2½ h.p. three-speed Premier).

(3) A "six horse power" snow plough at work, which rendered valuable aid in the ride from Harrogate to Scarborough.

A Winter Ride in the Snow.—

at York at 4.15, dead beat, and practically deciding to throw up the sponge. Persevering, however, he found, as the others had done, the roads very much improved, but he called a halt at Spittle Beck and had something hot, and his legs well rubbed with whiskey.

Better Conditions.

After this things improved, and Malton was reached about 7.15, where some more sustenance was obtained and also a welcome rest of about half an hour. The snow-drifts near Staxton caused considerable trouble, but luckily they were only deep and not broad as well. This last section is twenty-two miles, and it was covered in about 2h. 20m.—an exceptional performance.

The motor cyclists took seven hours and a quarter; the push-cyclist took nine hours and a half. The motorists had stopped more than the other, and would easily have improved their times had they gone straight on, and they naturally arrived at the journey's end much fresher than the cyclist; but, notwithstanding these comparisons, the performances of all were excellent under such extraordinarily arduous conditions.

H.W.F.

Taxation of Business Motor Cycles.

A TEST CASE TO BE FOUGHT BY THE A.C.U.

WE are repeatedly asked whether a motor cycle is exempt from the local taxation licence provided it be used solely for the purpose of business. Our reply is to refer readers to the list of definitions and exemptions published on the declaration form for establishment licences. This reads as follows:

"For a waggon, cart, or other such vehicle which is constructed or adapted for use, and is used solely for the conveyance of any goods or burden in the course of trade or husbandry, and whereon the Christian name and surname and place of abode or place of business of the person, or the name and style and principal or only place of business of the company or firm keeping the same, shall be visibly and legibly painted in letters of not less than one inch in length."

We feel compelled again to draw attention to this matter on account of some correspondence which has been sent us by a Yorkshire reader, who informs us he uses his motor bicycle solely for the carriage of goods connected with his trade, and has his name and address painted upon the machine in letters one inch in height, the machine being equipped with an extra large parcel carrier. Our correspondent, Mr. T. W. Taylor, of Skelmanthorpe, near Huddersfield, has been exempt from the licence since July, 1907, because he received a letter from an Inland Revenue official of Huddersfield pointing out that his machine was exempt from carriage licence duty provided it was fitted and adapted for carrying goods, and was solely so used.

Five Years without Paying a Tax.

From 1907 until 1911 Mr. Taylor paid no tax, but since the collection of the licence fees has been in the hands of the county authorities at Wakefield he has been informed that his motor bicycle does not come within the exemptions provided by statute, and that the licence committee have no authority to release him from payment of the duty. In view of the 1907 letter referred to, the committee did not press for the payment of the licence fee for 1911, but they do insist on its payment for 1912, and in a letter from the Wakefield authorities it is pointed out that to claim exemption the vehicle must not only be used solely for business purposes, but must be constructed or adapted solely for the carriage of goods. The same letter points out that *a motor cycle is constructed for the conveyance of a person, and the mere fact that an article or articles are carried on the machine does not bring it within the exemptions referred to.* An appeal by Mr. Taylor to the Inland Revenue Board in London brings the reply that "the Board of Customs and Excise having vested the administration of the carriage licence duty in England and Wales in the respective county and borough councils, they cannot interfere in any way in matters in dispute between the councils and the public." This is curious, as this body frames the regulations and sanctions the forms which are sent out.

What is the Correct Interpretation?

One of our reasons for publishing a summary of this correspondence is that an Inland Revenue officer having interpreted the exemption clause in such a way that it allowed a motor bicycle to be exempt, and subsequently another authority gives an entirely opposite opinion, leads one to suppose that there is some considerable doubt as to the correct interpretation. The authorities, of course, argue that if a motor bicycle can be used at any time for pleasure purposes it cannot be constructed *solely* for the purpose of carrying goods. It is just one of those cases which we think should be settled one way or another at once, because if a motor cycle owner is prepared to swear that he never uses his machine for any other purpose than for business and the carriage of goods, we do not think he should be called upon to pay any more than the owner of a trap or other vehicle who does not use it for pleasure purposes.

It is the duty of the county authorities to find out whether the person who makes a declaration is stating the truth or not. If the owner never uses the motor cycle for any other purpose than the carriage of goods, how can the authorities demand a tax except by taking proceedings against him for making a false declaration?

We thought the above case of sufficient importance to warrant the attention of the governing body of motor cycling, therefore the whole of the correspondence has been laid before the Legal Department of the Auto Cycle Union, who have decided that if proceedings are taken they will arrange to defend the case at their expense in the interests of motor cyclists generally. Readers will, we know, await the decision of the authorities in this matter with interest, because there must be a number of motor cyclists who use their machines solely for the carriage of goods in the course of business, and who are doubtful whether to refuse to pay the local taxation licence under the circumstances.

OCCASIONAL COMMENTS.

By "IXION."

The War Office.

If one may judge from the prophecies of service men in general, we are in graver danger of war on English soil than we have been for many centuries, and it is obvious that if this country were invaded, or compelled to prepare for invasion, our vast host of motor cyclists could be of enormous utility to the defending generals.

Naturally, a great many motor cyclists lack the time and inclination to undergo military training, but should an invasion come to pass we should probably all be called upon. Consequently those who do not care to attach themselves to a military unit in times of peace should, nevertheless, stretch their patriotism so far as to acquire two sorts of knowledge. The one is an exact and detailed acquaintance with the roads of their own counties, including all by-lanes, an acquaintance sufficiently thorough to render fast night work within a radius of fifty miles an easy matter; and the other is the rudiments of rifle practice.

Perhaps not all my readers are aware that the rudiments of marksmanship can be acquired with a saloon rifle or airgun. Prior to the outbreak of the South African war an Oxford tutor used to train a few undergraduates with air rifles over a twenty-five yards range in his garden; when the war broke out all these undergraduates enlisted. Not one of them had ever handled a service rifle before, and each of them shot up to "marksman" standard at his first visit to the ranges.

Stream-line Bodies as a Weather Protection.

I have been out on the roads during the late severe weather, and from sights and experiences I am sure the genuine all-weather motor cyclist could do with something in the way of a light shell body, preferably of the detachable type. It should not be very difficult to devise a light steel framework, with either wired panels of patent leather, attached by spring clips, or aluminium panels, which could serve a double purpose, and both protect the rider from dirt in mucky weather, and from cold on frosty and blusterous days.

On the 5th inst. I drove down the Bath Road inside a comfortable limousine, and the motor cyclists we encountered were arousing sincere pity all along the famous highway. They were muffled in leathers, furs, and helmets, but were obviously shivering, and on several occasions we saw riders dismounted and trying to stamp themselves warm. A few days previously I had seen a large clump of mud-bespattered men arousing pity and derision for quite a different cause on another famous main road. There is not the least reason why a motor bicycle should not be as suitable for all weather work as a car, skidding only excepted.

A light shell body, the plan view of which would be roughly V-shaped, would transform rough weather riding; it should protect the whole of the front of the driver, and come high enough to safeguard his anatomy as far as the breastbone, since the ears and eyes can be protected by goggles and sideflaps, while handle-bar muffs can keep the hands warm. The side guards could be made to come sufficiently far back to shield the legs and thighs from side winds, without rendering mounting or dismounting difficult. A machine so fitted would be a rare preventive of chills and colds. The weight need not exceed 20 lbs. to 30 lbs. all told, and the cost would be under £5. The existing mudshields are well enough as a beginning, but they stop short at the protection of the machine, and only in one or two instances do they protect the rider's legs. Any rough weather rider will tell us there are moments when he does not care a hang about the condition of the machine—his whole being goes out in one fervent sob for better protection of the *man*. If "stream-line" bodies are desirable for racing purposes, as a recent correspondent believes, a somewhat more lofty and commodious stream-line body is certainly essential to warm and cosy riding in extremely severe weather.

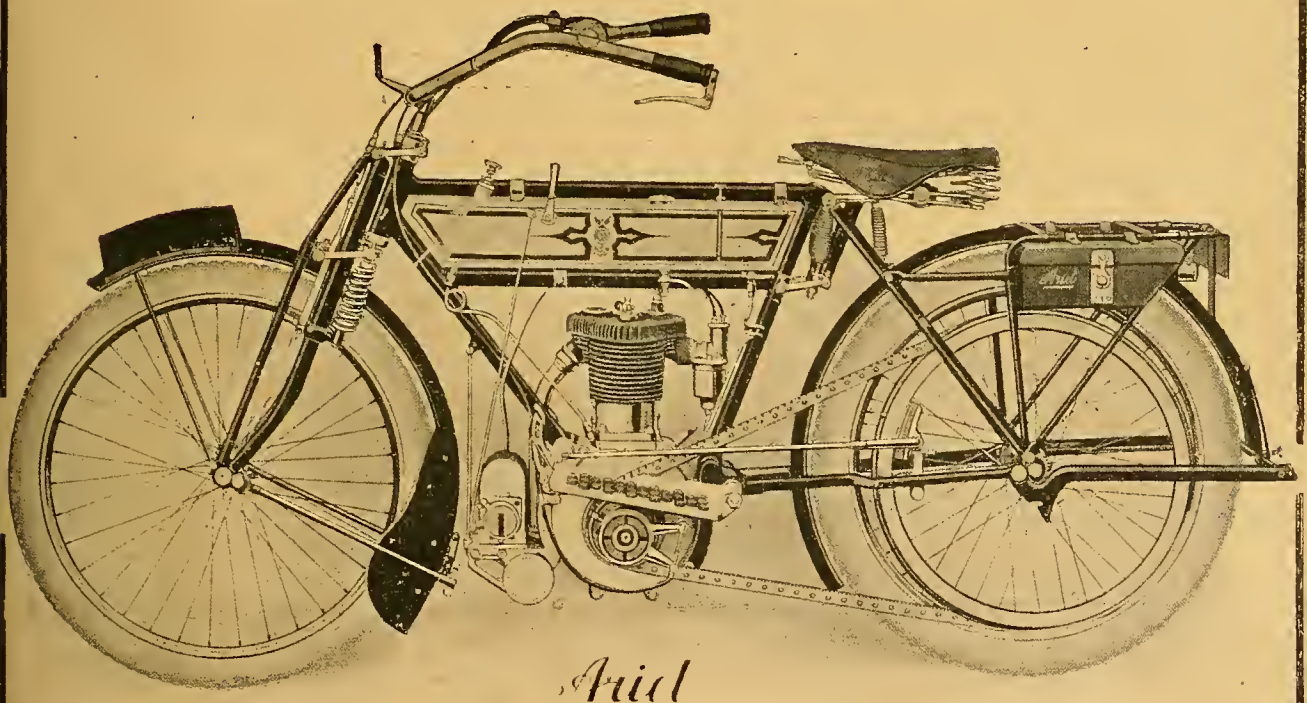
The Transmission Question.

I notice that some of the American motor cycle journals are making great copy out of the fact that the number of chain-driven machines exhibited at Olympia is on the increase, and their scribes write as if England were abandoning the belt drive on standard touring machines. The facts are quite opposed to such a view. The increase in chain-driven exhibits over here is *at present* almost exclusively due to (a) the increase in change-speed gears, (b) the increase in passenger outfits, and (c) the increase in twin-cylinder engines.

On the single-geared 3½ h.p. standard touring mount the belt is not only *facile princeps*, but its reign is practically undisputed. I do not deny that a more weatherproof transmission may eventually oust the belt, for the faults of the belt are as obvious as its merits, but at the present moment the English trade and public appear to regard the belt as a most satisfactory transmission for standard solo mounts.

Moreover, it is quite on the cards, when we take other pointers of development into consideration, that if a rigid drive does eventually become predominant, that drive may be a shaft rather than a chain.

ANOTHER CONVERSION.



The three-wheeled sociable shown in the accompanying illustration is the property of Mr. R. W. Edwards, of Spennymoor, Co. Durham, and was formerly a Rexette tricar. It is fitted with an 8 h.p. water-cooled twin engine, the transmission is by chain to the rear wheel, and, as will be seen, tiller steering has been adopted in place of the wheel steering originally fitted.

In answering this advertisement it is desirable to mention "The Motor Cycle."

"The Daily Mail," February 2, 1912,

says of the

3½ h.p. ROVER

"IDEAL MOTOR CYCLE."

"Here, surely, is as near the ideal for its type as one can expect motor cycle manufacturers to produce.

It is in perfection of detail that this machine makes so rare an appeal.

Never have I ridden a machine of this type which was genuinely quieter under all conditions of driving.

This engine proves a veritable delight in its instant responsiveness.

The workmanship is obviously of the very best."

1912 Models from £49.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

War Office Test at Brooklands.

Sir,—I observe in the issue of February 1st an interesting account of the War Office test of certain motor cycles, and one cannot help thinking it strange that so few of the well-known home manufacturers took part in an event of such public importance. The machines tried were certainly good ones, but I cannot understand why others like the Singer, Humber, Rover, New Hudson, etc., were not included.

Naturally, one can only surmise that the War Office authorities imposed some restriction which caused these firms to stand out. The 2¾ h.p. twin Humber with three-speed gear which won the Junior Tourist Trophy race last year would, I have not the slightest doubt, have put up a good performance, and there are several others which might have been included in order to make the trial a representative one of the best British produced machines. G. W. NOTT.

[No restrictions were imposed other than those published regarding speed and hill-climbing. The trial was private, so, naturally, the War Office could ask which firms it liked.—ED.]

Cycle Passenger Attachments.

Sir,—It is quite evident that the 2 and 2½ h.p. motor cyclist has friends, wife, or children whom he would gladly have for companions, but the expense of higher horse-power, two-speed gears, extra wear on tyres, belts, etc., makes it quite out of the question. To this class of rider I make the following suggestion:

Get a strong lady's pedal bicycle (1¾in. tyre for preference), remove the front wheel and forks, fix the saddle some few inches further back, and couple up alongside the motor cycle. By withdrawing the front fork you not only save the extra licence, but can get a strong connection through the head of the pedal cycle. Then there would be no extra weight on the rear wheel, which is a consideration. Each machine carries its own rider; very little strain on the motor frame, because on approaching any hill the cyclist would pedal as well as the motor cyclist, and this should be about equal to a two-speed gear. The handles would be retained, and the usual back wheel brake.

I generally ride alone, and am getting tired of it, and think if the makers of such appliances would only put the above mentioned to a test, it would become popular. Should be glad to see opinions of lightweight riders through the medium of *The Motor Cycle*. C.D.

Hill-climbing.

Sir,—Last summer I had occasion on tour to descend Honister, so that perhaps the following may be of interest to Mr. F. Smith.

The "surface," if such a word can be applied, consisted of about a foot deep of "loose scree," making it necessary, if I valued myself or my machine, to walk down. This I did, and it required considerable force to hold back the machine, and on applying the brake, even slightly to check the machine, it would skid, and several times nearly went over, the wheels being quite unable to get a grip.

A motor cycle is intended, I believe, for use on ordinary roads and in reasonable places, but to put it to a hill like Honister is sheer imbecility. If all that Mr. Smith wants is trouble, he will get plenty of it, and welcome to it. But I do not think this is what he wants; if not, he is well advised to leave it to someone else. Really, is the honour and glory of being able to get up worth the expense and risk—expense for new tyres, and certain damage to other parts on account of falls; risk of injury to himself, serious if he gets off the road on either side? If he thinks it is, let him try, and if he succeeds, then let him attempt the ascent of Ben Nevis, for surely he will not own that what a car—and an American one to boot—can do, his machine cannot. But if he wants a good honest pull to test his Clyno, let him go abroad, and try some of the pimples there.

With regard to Mr. Newman's remark as to the gradient, I should say that he is correct, as when descending I measured the gradient at several places. PETROLIX.

To the Tyrol and Back.

Sir,—I have read with interest the "Tyrol Tour" of Messrs. Fawcett and Grange, all the more so as they followed, to a great extent, the route I had taken, three weeks before them, to Venice. I was hoping to learn that they were the two English motor cyclists who had left the Hotel Croix de Malte et d'Italie at Lecco on the morning of the day I arrived there, viz., July 6th, and I see that Mr. Grange, strangely enough, stopped at this same hotel, but on July 26th. Who were these two other English motor cyclists? Will they declare themselves? Truly, the world is a small place for motor cyclists.

I cannot agree with Mr. Fawcett that the surface of the Simplon Pass was so bad. There are large stretches of unrolled stones, it is true, but one cannot expect a steam roller on an Alpine pass. Again, I found the pass regulations more fearsome on paper than in the reality. The pass is about twenty-four miles, and, surely, one would not grudge four hours over this, through gorgeous scenery. When one goes to Rome one must do as the Romans do. Therefore, when one goes to Switzerland, drive slowly and considerately, because the Swiss are motorphobes at present.

I feel quite at one with Mr. Fawcett as to the "uncivilised" *pavé* in the neighbourhood of Versailles and St. Germain, and indeed in all the towns and villages on the Boulogne side of Paris. To escape bad roads and *pavé*, go by way of Cherbourg and Normandy, and so diagonally across France to Switzerland.

May I ask Mr. Fawcett one question? He rode a single-geared machine, I a two-speeder. Quite apart from the merits or demerits of gears, would he not have been happier and (in the appalling heat) more comfortable on bad *pavé*, mountain hair-pins, and passes generally, if he had had a low gear to crawl along on? In answering this question I would like him to put aside whether or not there is more sport in conquering passes on a single gear. Mr. Fawcett will agree with me, I am sure, in advising all prospective tourists to avoid the roads in the Plain of Lombardy.

I may say that I have planned a tour for this summer which comprises the Rhine Valley and the four highest European passes, but I have not yet found a companion.

I should like to thank Mr. Fawcett for a most interesting article, and I hope you will continue to publish tours, as to me, at any rate, they are infinitely more interesting than accounts of records, hill-climbs, reliability trials, and such like. R.M.B.J.

Experiences of the R.I.C.

Sir,—May I relate an encounter I had with a Dublin "bobby"? I was pushing my motor cycle along a side street trying to find a certain office. Not finding the place, I pushed my machine to the end of the street, where there was a constable on point duty standing on the far side of the main street. As I was pushing my machine, I did not trouble to sound my horn when I came to the corner. When I reached my friend, he gravely pointed out my error at my not sounding the horn, and said, "Shure now, if

ye was kilt ye would not have a word to say for yourself." On my remarking that that was more than likely, he told me to "G'wan out of that," and then, bending down, he whispered softly, "I suppose you couldn't give me any tips for Leopardstown."

The Irish police are, as "Pat" says, a most sporting lot, but are as stern as any other breed against wilful offenders.

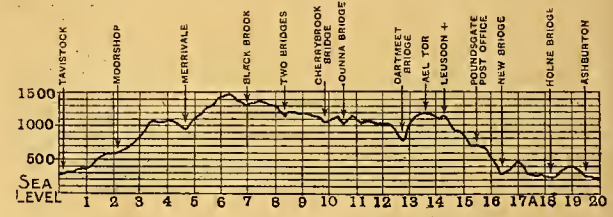
T. C. D.

Sir,—Having read with considerable interest, "Pat's" letter on the sporting way in which the R.I.C. dealt with his case, I should like to inform your readers of the difference in treatment meted out to me by the London police.

On Saturday, December 9th, 1911, I was proceeding towards Sutton, and, owing to the congested state of the traffic, was compelled to run very slowly (for some distance on the low gear). On getting to Figgs Marsh, where I was aware a police trap was being worked, I was stopped by the police and informed I was exceeding the limit. My maximum hand on the speedometer registered 14¾ m.p.h., and this was pointed out to the sergeant. However, I was summoned and convicted at the Croydon Police Court on the evidence of the three policemen working the trap, which was so much at variance with my evidence and that of my witnesses that the solicitor to the R.A.C. (who defended me in court) brought the case to the notice of the Scotland Yard officials. Whilst the high police official who investigated the case was most courteous in his treatment, he expressed regret, etc., that nothing could be done, the evidence being so conflicting and the police officers' statements so much alike. The main point was that the sergeant stated in evidence that he tapped the glass of the speedometer (a Cowey), and the maximum hand fell back, whereas my witnesses swore that he did not tap it, and that had he done so it would not have fallen back. The high police official who investigated the case asked the sergeant to tap the glass of the speedometer in his presence, which he did, and the maximum hand did not fall back.

Although I had the matter investigated, the position remains precisely the same, so I have adopted the only course of active protest open to me. I resigned from the special reserve of police and the National Reserve, and I would suggest that if an active protest were made by motorists in all cases where they have been so unjustly treated, there would soon be a much better state of affairs brought about, and the long-suffering and undoubtedly persecuted motorist would receive treatment more in accordance with our friend "Pat's" experience.

In conclusion, please allow me to congratulate Irish motorists on having such a fine body of police as the R.I.C.



A. H. PRIESTLEY.

"Frozen jet"—one of the drawbacks of winter riding.

Suggested Routes for the Six Days' Trials.

Sir,—You may recall some correspondence over the signatures of "T-111I" and "H.P.B.," in which route 746 in the "Contour Road Book" was mentioned as a tough one. A little party, including the above-mentioned, acquainted through your valued journal, made measurements of part of the route and gradients during a recent week-end. I enclose a contour section culled from Gall and Inglis, and the actual gradients obtained appended thereto.

Contour section of route 746 from Gall and Inglis route book. Between the 12th and 13th milestones the steepest gradient is 1 in 5·3, 13th and 14th 1 in 4·8, 4·9, 5·5, and 1 in 6; 14th and 15th 1 in 5·3; 16th and 17th 1 in 4·5, 5, and 6·3, and on a bend 1 in 4·36; 17th and 18th varying from 1 in 3·5 to 1 in 6 from inside to outside of bend.

The corner marked A on the diagram provides an excellent example for "the exaggeration of gradients." Measured at various points across the width of the road, anything between 1 in 3.5 and 1 in 6.0 is obtainable. A solo machine ridden wide out would traverse the latter figure. A sidecar machine (sidecar on left) would take a track at about 1 in 4.5 to 5.0; but I venture to opine if a certain type of rider went over the route, it would be a much-lauded performance over a 1 in 3½ grade. Dartmeet (Ashburton side), like Birdlip, has no acute corners, but is shorter and considerably steeper. One occasionally reads of the 1 in 4 on Birdlip, but such does not exist. The very worst of Birdlip occurs nearly in the middle of the hill, and gives thirty yards of 1 in 5.5. At the top it tilts up again for a few yards, from 1 in 9 to 1 in 6.

A Triumph (solo), Bradbury (solo), and 5·6 h.p. Bat (two-speed, coach car, Whittle belt) journeyed, and none made an entirely clean ascent of all hills, though at the same time no particular effort was made to do so, surveying being the order of the day. Belt slip (in spite of resin) let the sidecar outfit right down on two occasions, 7.7 being too high a gear to allow any margin for belt slip and for the heat resulting from miles of large throttle, on low gear. The failures were particularly annoying, as occurring on grades quite insignificant with those already climbed. No second attempts were made, owing to the belt-stretching-and-slipping nuisance.

This being a main road route, I suggest it affords a good road for inclusion in the Six Days' (Taunton) Trials, especially if non-stops were insisted on, to exclude the crude method of change-speed gearing by shortening belts and screwing out pulleys.

If anything steeper is wanted, a hill off this road grades 1 in 2¾, and not merely a Staxton Brow hump in the road (*vide* gentleman residing near by).

H.P.B.

Sir,—With Taunton as a centre of the Six Days' Trials, the competitors will no doubt have an opportunity of testing their machines on the Devonshire hills, which are narrower and more curly than some which they have met before; and innocent-looking hills, on which, when the apparent summit is reached, is found another rise with perhaps a single figure gradient, are followed by an ascent with several bends of perhaps half a mile.

There are, however, two routes in Devon that the ordinary local rider generally shuns, or, if he goes there, is prepared for possible trouble. These routes are the Lynton and Lynmouth roads, and Porlock (although a little way

inside the Somerset border) might be included. The other route is the twenty miles run from Tavistock to Ashburton *viâ* Two Bridges.

Could not local riders perhaps help the organisers of the Six Days' Trials by making suggestions and giving particulars of hills a little bit off the main road, but sufficiently close to be useful as a hill-climb? Would the organisers welcome such suggestions? T 1111.

Definition of Quadcars and Runabouts.

Sir,—In looking through your issue of February 8th, we could not help feeling some little surprise at the absence of any reference to the Wall machine in your article on the definition of quadcars and runabouts. As you know, our firm were one of the pioneers of the tricycle movement, and its present perfected form deserves a place in any comprehensive review of these interesting articles. A. W. WALL, LTD.

[We apologise for the apparent omission of the Roc tricycle, but the list published was not a complete one of every runabout on the market. The weight of the Roc chassis is 3 cwts.—ED.]

Two-stroke Engines.

Sir,—Having read with great interest the very able article by "W.G.A." in your issue of the 1st inst. upon the subject of two-stroke engines, might I be permitted to ask for information upon a point which, I believe, would be of general interest to those who, like myself, are beginning to awaken to the possibilities of these engines?

What I would ask "W.G.A." to oblige with is a brief description of the means adopted by the various makers he mentions to vary the speed and power of their engines within the limits of flexibility of the type. I presume the effect of varying the time of ignition to be about the same as in a four-stroke engine, but the arrangement of the throttle (if any), and whether it is placed between the carburetter and the crank case or other compressor, or between such compressor and the working cylinder, is a point upon which I desire enlightenment; also I should like to know approximately what range of flexibility can be obtained with each type. T 51.

[All of the engines described in the article on two-stroke engines are controlled in exactly the same way as are those of any other type, viz., by altering the setting of the ignition and by the use of the throttle on the carburetter. Whether this system is right or not remains to be seen, and it is possible that this point will be thoroughly dealt with in a future article. In the meantime, it is interesting to note that the two-stroke Scott engines which were used in the T.T. race last year were fitted with rotary distributers applied to the transfer ports, whilst a mechanical arrangement in the distributer itself takes the place of the usual throttle.—ED.]

Who will Adopt the Quadcar?

Sir,—While agreeing in general with your remarks in your leaderette of the 8th inst., relating to quadcars, permit us to point out that it is by no means difficult or impossible to keep within the weight limit of 3 cwts. for these cars. No model of the Bedelia, which is practically the only standardised quadcar which has stood the test of time, weighs as much as 3 cwts. Even the 10 h.p. model, which is the heaviest, does not exceed this weight. L. N. PALMER AND CO.

Sir,—I am rather sorry to note the position you take up in your leaderette, "Who will Adopt the Quadcar?" With all possible respect to the weight of the editorial opinion, I submit that the "sociable" of whatever form is a vehicle of interest only to motor cyclists. This being so, how can it be expected that men whose whole interests are centred in cars can sympathise with the wants of motor cyclists, who are the class that will use the new vehicle? Surely the officials of the A.C.U. are the men! The fact that Government regulations dub a motor cycle with four wheels a car should not have much influence on the opinion of motor cyclists.

The demand for the sociable arises primarily from those who are dissatisfied with the protection given to the rider of the sidecar. Though his passenger is well looked after, he must still don the hideous and ostracising overalls. We want a motor cycle to carry two—a substitute for the sidecar. Whether the best form is one with three or four wheels remains at present an unsolved problem, and one that should be decided as soon as possible. But this can only be done by allowing the two to compete side by side, with no restrictions save weight and price.

It seems to me absolutely axiomatic that if the new vehicle is to survive it must be in virtue of its complete disconnection from car lines, partaking entirely of the characteristics of the motor cycle. I think, therefore, that the limits of 600 lbs. and £100 mentioned on page 138 of your issue are too liberal, since they will admit much of the car element which must be kept out at all costs. It is rather interesting to note in this connection that the only machines in your list which have acquired any reputation at all fall far within these limits. May it not be that herein lies one of the secrets of their success? H.M.

Multi-pole Sparking Plugs.

Sir,—Having read with interest the correspondence under this heading, I write giving my experience with the Lodge d.p. plugs, which I have fitted to my sidecar machine, a 9 h.p. Bat-Jap.

I have the d.p. plugs fitted in cylinder heads and plugs of another make over the exhaust valves. I have not had any trouble in starting (owing probably to having free engine with handle starting), but I find a great improvement in running, the engine being more flexible and keeping much cooler with a marked increase of power with the same throttle opening. This can easily be tested—when climbing hills and shorting the ordinary plugs the engine speed falls off, but when the short is taken off the engine at once picks up without touching the throttle or air lever, which proves what the makers claim for them.

As to the magneto this is not in the least affected, and does not seem strained or overloaded, and does not get hot, which it would do if overloaded, especially in a position like the Bat, protected from cooling draught in the tank.

H. WITHERS.

Sir,—In reply to the letter from Mr. Arthur E. Bennett on the above subject, we would like to point out that the Lodge plugs are in use on a large number of motor cycles, and no magneto has yet been damaged by their use. This is as everybody, who looks into the question, would expect.

The severest strain that a magneto must be designed to withstand is when the engine is turning round fast, and the high tension cable becomes detached from the sparking plug. The spark, of course, then occurs at the safety spark gap. If the use of the double pole plugs strained the machine to anything like this extent, there would be constant misfiring, owing to the spark occurring at the safety gap. As a matter of fact, if the double pole plug is used according to our instructions, it is practically no harder work for the magneto to fire at the two plugs than at the one ordinary plug. . . . . You will observe that no maker of magnetos who does not also make a double pole magneto has offered any objection to the use of the Lodge plugs.

We think the two diagrams shown below will illustrate what a slight difference there is between the two methods of

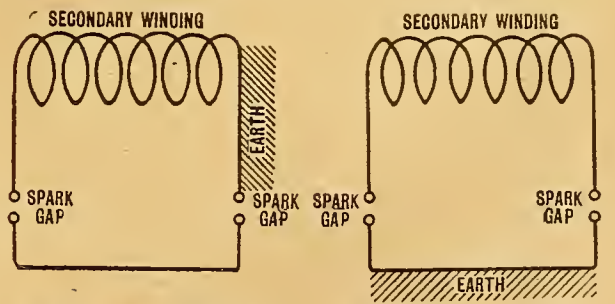


Diagram of high-tension circuit for ordinary magneto, using one Lodge double-pole plug and one ordinary plug.

Diagram of high-tension circuit for double-pole magneto, using two ordinary plugs.

firing under discussion, and unless the double pole magneto is considerably larger than the single pole magneto, it would be difficult to provide any more insulation. The two circuits are the same, the only difference being that a different part of the circuit is "earthed." LODGE BROS. AND CO.

Silence.

Sir,—In your issue of February 8th we notice a letter from Mr. H. D. McRae Gallanday, describing and illustrating a silencer in which air currents are induced by and mixed with the exhaust gases. This silencer was fitted to the early experimental "Scott" machines, and is fully protected by our patent No. 3367 of 1904.

THE SCOTT ENGINEERING CO., LIMITED.
FRANK PHILIPP.

Silencers in the Big Trials.

Sir,—To read "Ixion's" comments in the issue of February 8th in regard to the above, one would think that there was only one type of silencer, and that the barrel style with a number of small holes out of which the exhaust gases pass.

I would like to ask if "Ixion" has any objection to the type of silencer used on the Indian motor cycle, which consists of a very large exhaust box with a long tapered tube attached to it leading out past the rear wheel, and would he suggest that this most efficient type of silencer be discarded in favour of his suggested A.C.U. silencer with a fixed number of holes and an auxiliary barrel inside the main exhaust box—a device which, at its best, can only be an efficient silencer and cause back pressure, or be free and noisy. NIGHTBIRD.

Experiments with Hydrogen Peroxide.

Sir,—The tip which one of your readers gives to increase the brilliancy of the light of acetylene lamps, namely, by using hydrogen peroxide H_2O_2, is at fault, for when oxygen is mixed with an illuminating gas it reduces the luminosity of the gas by consuming the carbon in the flame; but, on the other hand, if acetylene be burned in an atmosphere of pure oxygen, or rich in oxygen, it burns with intense brilliancy. Special care should be taken not to spill hydrogen peroxide on any of the aluminium parts of the cycle, for it instantly oxidises it, and, if left on, will rapidly corrode it into holes. M.P.S.

A proof of the above letter was submitted to Mr. A. Renfred Myhill, whose article on the above was published January 25th. He replies as follows:

Sir,—I am returning the proof of your correspondent's letter. With regard to the first part, I think he must be thinking of the effect of oxygen on a gas such as ordinary coal gas, where the admission of oxygen into the gas would have the effect described. With acetylene, however, much more oxygen is required for complete combustion than in the case of coal gas, so that, up to a certain point, mixing oxygen with it before combustion is an advantage, since ordinary air around the flame rarely suffices to burn the gas in the best possible manner. Of course, a great excess of oxygen would reduce the brilliancy.

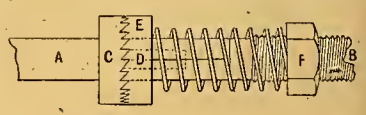
With respect to the second part of his letter, he is theoretically correct, as H_2O_2 certainly has an oxidising effect on aluminium, but, from experiments I have conducted, I find that the action is so slight as to be of no great inconvenience.

I am sending, under separate cover, two pieces of aluminium, one of which (marked "X") has been in a solution of hydrogen peroxide (about ten volumes) for forty hours, and another piece, cut from the same sheet, which has been left untouched. You can see for yourself that the action is very slight, so that your correspondent's remark that it will "rapidly corrode it into holes" is quite erroneous. A. RENFRED MYHILL.

A.C.U. Trials Regulations.

Sir,—It was with some surprise that I read the summary of the conditions for the A.C.U. one day trial, to be held on March 2nd. To qualify for a first-class certificate a machine must conform to the eleven requirements drawn up by this body, No. 1 of which I think quite out of place, viz., "that all machines *must* have a free engine or a variable gear." Now, in my case, I have just bought a 1912 Douglas model G, that is the ordinary single speed and no free engine. There is no need for me to go into the abilities of this famous little machine, as it is now well-known, but I feel certain whatever the course may be on the 2nd, excepting punctures, I shall get round and fulfil all the other requirements of the A.C.U.

My weight in ordinary clothes is 10 stones 8 lbs., and I am able to take hills of about 1 in 6 or 7 without pedalling. If we are to have steeper hills than this (which may quite well be expected) I believe this machine comes under the class when pedalling is allowed. However, if one has faith enough in his machine to enter why should he not be allowed to without having to ride a free engine or variably geared model?



What is the use of a free engine on a machine that starts as easily as a 1912 Douglas, or a two-speed gear for a rider of my weight? It takes me practically anywhere without pedalling and absolutely anywhere with pedalling. I know some object to be seen pedalling. Well, they need not be seen doing so if they ride a Douglas, because it is only on exceptional hills right away from main roads that it is ever necessary, and in such out-of-the-way places there is seldom anyone to see them.

The A.C.U. has lost my entry fee for one in this trial, and I am certain there must be others who own machines quite capable of making non-stop runs without having the free engine or two-speed gear, but who, under Rule 1, will be shut out. . . . . .

I am, for the time being, with my single-speed mount,
CONTENTED.

The Evolution of Transmission.

Sir,—The recent articles in your most excellent paper on the above subject are quite interesting. Of course, it is fairly obvious that eventually the shaft drive must come to the fore. A belt or chain was naturally the first drive to be used, as its construction is so much cheaper and its mechanism simpler. The motor car started in just the same way, and it is only of recent years that it has emerged from the abyss of the belt-slipping or chain-jumping-sprockets-never-ending trouble of this form of drive, and, of course, as soon as the public demand it, the motor bicycle will do the same. The accompanying drawing is a simple form of clutch which could be fitted to a shaft drive to guard against the unpleasant consequences of engine seizing. A B is the driving-shaft. A is the engine end, and has fixed flange C and also pin D. One end of the shaft marked B is finished off square, upon which is placed the flange E, which meshes with the flange C. F is the nut to adjust the tension of the spring until it is just strong enough to hold the ratchet in position when the engine is pulling full power. Then in the event of the engine seizing, the ratchet would slip, and thus prevent unfortunate events equally as well as the belt.

E. NEAUM.

Inclined Engines.

Sir,—"Ixion," in the issue of February 8th, comments on the American practice of inclining the single-cylinder engine backwards, and expresses a desire to learn the reason why.

I can only speak for the Indian, the pioneer motor cycle of America.

The first and most important reason why our single-cylind r engine is inclined backwards is because the cylinder walls get far better lubrication in this position than when standing vertical, particularly on the back side of the cylinder where all the piston thrust comes. It is a well-known fact that in all twin-cylinder engines (except our own, where the oil is fed directly into the wall of the front cylinder) the rear cylinder gets better lubrication than the front. A little study of the principle of splash lubrication will soon convince anyone why this is so.

A second and very good reason why the single-cylinder is inclined backwards is that on account of its being a long-stroke engine with overhead m.o.v., a lower frame can be used than would be possible if the engine were set vertically.

A third and somewhat reasonable argument for inclining the engine backwards is that in this position there is no piston clatter, which is so often experienced in vertical engines, though partially overcome by putting a piston ring at the bottom of the piston.

The only reason I can offer for other American manufacturers adopting the backward position of the single-cylinder is that they all more or less endeavour to copy our design, in the same way that some of the more recent entrants into the English motor cycle business have copied the pioneer makes in this country.

As for weight distribution, inclining the cylinder backwards does not throw more than two pounds at the very most off the vertical position, and in our case this is more than offset by the location of the magneto.

W. H. WELLS.

A WORD ON INTERNATIONAL COMPETITION.

NOW that after a lapse of some years international competitions are being revived, it is to be hoped they will be well supported on both sides. The hearty welcome extended by the Dutch Motor Cycle Club has met with an excellent response, and we hope that other important Continental competitions will likewise be supported. In the same way two great international events, the Tourist Trophy Races, are open to the world, and foreign makers will be heartily accepted in the entry list to compete on even terms with British machines. Last year France, Germany, America, and Switzerland were represented, and we hope that support will be forthcoming from these sources again. We do not wish to be unpatriotic, but if important English makers wilfully withdraw from the races, the A.C.U. has no other alternative but to welcome entries from small English makers and foreigners. It would greatly emphasise the sporting side of the event if a special international prize were given to the best aggregate times made by a team of five riders, the components of each team to be of one nationality, and if, say, England, France, Holland, and Germany were to enter teams it would greatly increase the interest in the races. In whatever Continental events English teams compete this season, it is to be hoped that their members will respect and not abuse the hospitality offered to them.

A SHROPSHIRE TOLL BRIDGE DOOMED.

ON the wall of the toll house at the end of the doomed trestle bridge at Cressage in Shropshire may be seen the scale of charges. Coach and six, 2s.; coach and four, 1s. 6d.; carriage with two horses, 1s.; cattle, 10d. per score; sheep, 5d. per score; pedestrian, 1d. There is no mention of the motorist, but the toll of one shilling for a car and sixpence for a motor cycle has been a cause of much adverse criticism for several years. Within a few weeks the work of replacing this wooden trestle bridge by a stone bridge free from toll will be commenced. The property has already been purchased for the sum of one thousand pounds, and during March the task of demolition and construction is to be initiated.

Gradually but surely the few remaining toll bars and bridges are being swept away to make room for more modern methods. No form of road traffic has more right to demand up-to-date improvements than the motor cycle and the motor car.

MOTOR CYCLISTS' PROGRESSIVE ASSOCIATION.

THE following manifesto letter has been sent to us for publication. It has been issued by a provisional committee of members of the A.C.U. and representatives of affiliated clubs, who are desirous of introducing reforms in the conduct of the A.C.U., the governing body of the pastime. We publish an editorial comment on the situation in another portion of this issue:

The Editor, *The Motor Cycle*.

Sir,—At a meeting on the 8th inst., it was agreed to form the above Association, its immediate objects being:

1. To assist the A.C.U. in furthering the interests of motor cyclists.

2. To work to secure the adequate and efficient representation of active motor cyclists throughout the United Kingdom upon the committee and sub-committees of the A.C.U.; in other words, to ensure the government of the pastime *by* motor cyclists *for* motor cyclists.

Only open to A.C.U. Members.

It is strongly held by the promoters that there can only be one governing body, and that body is the A.C.U. For this reason, membership of the Association is confined to members of the A.C.U. and its affiliated clubs.

It is equally strongly held that the governing body must, in future, keep closely in touch with the needs and desires of the motor cyclists of the kingdom.

We want the A.C.U. to have a membership of 100,000 instead of about 5,000.

The subscription to the Association is 1s. per annum, so that no one need hesitate to join on the score of expense.

May we point out to our provincial friends especially that this Association should, and doubtless will, provide a special means of conveying their views to the governing body in London.

The committee appointed—with power to add to its number—consists of Messrs. J. W. G. Brooker, W. H. Brown, C. C. Cooke, W. Cooper, F. A. Hardy, A. J. Moorhouse, W. H. Wells, and the undersigned.

A further Meeting on the 29th inst.

A further meeting has been arranged to be held at the Holborn Restaurant at 7.30 p.m. on Thursday, February 29th, to which all members of the A.C.U. and affiliated clubs, in sympathy with the movement, are cordially invited.

In the meantime, applications for membership, accompanied by subscriptions (1s.), should be addressed to Otto Thomas, chairman, *The Motor Cycle* Offices, 20, Tudor Street, E.C., or W. G. McMinnies, hon. secretary and treasurer, Temple Press, Ltd., Rosebery Avenue, E.C.

Winter Riding in France.

Despite the cold and the snow-covered roads, the Motor Cycle Club of France, to the number of fifty, held a run early last week from Paris to Compiègne.

Gala Day at Brooklands.

The Royal Automobile and Associated Clubs will hold a race meeting on the 27th July at Brooklands. The following motor cycle races will be held: A team race, each affiliated club to send a team consisting of two solo and one passenger machine, and a handicap race for solo machines. Mr. H. P. E. Harding is representing the A.C.U. on the R.A.C. sub-committee appointed to draw up the regulations.

A.C.C.F. Hill-climb.

The following regulations have been adopted by the A.C.C.F. for the hill-climb at Montenglaust (Coulommiers) on the 25th inst:

Motor cycles, Classes 1 and 2.—Maximum weight of machines unladen, but otherwise ready for the road 50 kilos (110 lbs.); section of tyres 50 mm. (2in.)

Class 3.—Maximum weight 60 kilos (132 lbs.); section of tyres 60 mm. (2⅜in.).

Tricars and Voiturettes. — Combined weight of passenger and driver 150 kilos (330 lbs.). The competition is open to amateur riders, and the names of the machines ridden will not be published. The results in each class will be worked on formula.

Entrance fees are: Manufacturers, 20 frs.; manufacturers (members of A.C.C.F.), 15 frs.; amateurs, 10 frs.; amateurs (members of A.C.C.F.), free.

Auto Cycle Union Notes.

Open Competitions.—Permits have been granted to the following clubs to hold open competitions, subject to the regulations being in order:

Essex M.C. Open hill-climb, March 16th.

Derby and District M.C.C. Open hill-climb, March 30th.

Bristol M.C.C. Open hill-climb, April 20th.

Taunton and District M.C.C. Open hill-climb, May 16th.

Birmingham M.C.C. Open hill-climb, June 1st.

Birmingham M.C.C. Twenty-four hours' run to Edinburgh, September 21st.

Mersey M.C. One day trial, May 4th.

Mersey M.C. Open hill-climb, June 29th.

Mersey M.C. Open hill-climb, August 5th.

Six Days' Trials Awards.—As announced in our last week's issue, *The Motor Cycle* has offered two silver cups to the A.C.U. for the Six Days' Trials—one for the best performance by a private owner on a solo machine, and one for the best performance of a private owner on a passenger vehicle.

Dr. Iles, president of the Taunton B.C., has offered a silver cup for the best performance of a solo machine in a slow climb up Porlock, and it has been suggested that the cup offered by Mr. F. Harrison shall be awarded for the best performance of a passenger machine also in the slow climb up Porlock Hill.

Colonel Bowles, M.F.H., M.B., president of the Taunton and District M.C., has been asked if he will agree to the cup he has kindly offered being presented for the best performance of a passenger machine on the observed hills.

A hearty vote of thanks to those who had kindly offered these prizes has been forwarded by the A.C.U.

Motor Cyclist v. Roller Skater.

An exciting race took place at the Bootle Roller Skating Rink recently between Mr. J. Davies (5 h.p. two-speed Rex) and Mr. Warbis, who used roller skates. Mr. Davies is an amateur rider, who has never taken part in any race before; whilst Mr. Warbis is the fastest amateur skater in the district. The competitors started from opposite sides of the rink, and had to cover sixteen laps, or one mile.

The skater took corners very close in, and foot by foot drew up to his rival until at one point he was within six yards of the back wheel, and then the motorist pulled away from him, and finally won by yards. Time, 3m. 45s., 16 m.p.h.

SPECIAL FEATURES.

A Winter Ride in the Snow.
Electric Lighting for Motor Cycles.
A Sidecar Tour in Ireland.

Chest Pads for Racing.

American motor cyclists who wish to crouch down as low as possible on their machines to overcome wind resistance wear pads on their chests to protect them from vibration as they lie flat along the top bars of their machines.

British Imports and Exports of Motor Cycles.

The imports and exports of motor cycles and parts for the month ended January 31st, and extending over the last three years, are as follow:

Imports.

	1910.	1911.	1912.
Motor cycles ...	£3,676	£3,603	£3,480
Parts thereof ...	3,888	3,503	4,833
Total ...	£7,564	£7,106	£8,313

Exports.

	1910.	1911.	1912.
Motor cycles ...	£8,702	£18,804	£38,727
Parts thereof ...	2,283	4,895	13,436
Total	£10,985	£23,699	£52,163

As will be seen, the value of the month's exports each year is just over twice the amount for the corresponding period of the previous year, whilst the value of motor cycle parts exported in January this year is nearly three times that of the same month last year. The January imports have slightly increased since 1911, but an export value over six times that of the imports is sufficient proof of the healthy state of the industry.

OFF THE BEATEN TRACK. A scene in Cheshire during the recent severe weather.

Inter-team Trial in Surrey.

Owing to confusing F. W. Barnes with another competitor, we credited the former with changing the belt on his Zenith-Gradua in the above team trial, whereas he went right through with only one puncture in an unobserved section.

Entries for the T.T. Races.

The following is a complete list of the entries for the Tourist Trophy Races to be held in the Isle of Man on June 28th and July 1st:

SENIOR RACE.—O. C. Godfrey (holder), C. R. Collier, H. A. Collier, S. A. M. Witham, Blumfield, Ltd. (three Blumfield machines), John Gibson, J. T. Bashall, W. H. Bashall, D. C. Bolton, Hal. Hill, E. T. Bolton, J. L. Norton (3½ Norton), P. Brewster (3½ Norton), Scott Engineering Co. (two Scott machines), J. W. Woodhouse (Precision), and F. A. Applebee, jun.(———).

JUNIOR RACE.—P. J. Evans (holder), C. R. Collier, H. A. Collier, and J. W. Woodhouse (Precision).

The A.C.C.F. and the A.C.F.

At the present time the only body which is really alive to the interests of motor cyclists in France is the A.C.C.F., which ran the Gometz hill-climb so successfully last December. This energetic club is the first to devote itself seriously to the development of the motor cycle across the Channel, and is organising a hill-climb at Coulommiers on the 25th inst., and the

round Paris two-day reliability trial at Easter (appended is a map of the trial route), to which the Auto Cycle Union intends to send an English team, as well as other competitions. The latest development has been the refusal by the Automobile Club of France to recognise the A.C.C.F. What has happened is that the A.C.F. has let whatever interest it had in motor cycles drift into oblivion, and, now that an energetic body has set the ball rolling, has suddenly awaked to the fact that its powers are being usurped. It is unfortunate that there should be any discord at all at this juncture, when the sport is receiving a distinct fillip, and it is to be hoped that the A.C.F. and the A.C.C.F. will speedily patch up any differences which may exist. After the activity displayed by the latter body, the Motor Cycle Club de France has suddenly roused itself from its lethargy, and is organising several competitions.

FUTURE EVENTS

Feb. 17.—Sutton Coldfield A.C. Open One Day Trial.
Mar. 2.—A.C.U. Open One Day Trial.
„ 23.—B.M.C.R.C. Race Meeting.
„ 23—Herts. County A.C. Open Quarterly Trial.
„ 30.—Derby and District M.C.C. Open Hill-climb.
Apl. 5-8.—N.W. London and Herts. County M.C.C. Joint Trial and Open Hill-climb (Yorks.) and Ladies' Competition.
„ 8.—Westmorland M.C.C. Open Hill-climb on Brigster Brow
„ 13.—Oxford M.C.C. Open Hill-climb

Proposed Speed Limit at Hammersmith.

The inquiry into the necessity for speed limits at Hammersmith will take place on the 29th inst., when the following restrictions will be asked for: (1.) A ten-mile speed limit from Brook Green to Hammersmith Broadway. (2.) A five-mile speed limit across Hammersmith Broadway and the immediate approaches. The R.A.C. and the A.A. and M.U. are opposing this application, which is of unusual interest, as it is the first to be made for a speed limit on an arterial thoroughfare in London.

A Wonderful Engine.

A friend of ours, whose fertile brain turns out many inventions per annum, has lately built a wonderful engine which is fitted to a quadcar. The said engine is of microscopic dimensions, and fires a mixture composed of secret ingredients compressed to 200 lbs. per square inch. Although some of our friend's inventions are never heard of, this one has been, and its dulcet tones were first heard by a policeman. "Sir," said the worthy member of the force whose attention had been drawn to a gentle sound like the accentuated barking of an accelerated pom-pom, "you cannot drive a noisy motor car like that in the public streets." Our friend whispered above the re-echoing reverberations, "You mistake, my worthy one, the silencer cut-out byelaw is not yet in force." "No more it ain't," responded the sporting bobby in the purest classical English, "but if you will kindly make that machine stop that there barking, I'll help you push it 'ome, otherwise I shall constitoot that there motor car to be a noosance and hact accordingly"; all of which is by way of being a true story. The moral being that the byelaw referred to is unnecessary, as the police can prosecute under existing conditions.

Proposed Saucer Track.

What has become of the proposed Midland saucer track, concerning which there was considerable talk a month or two ago? Is it to sink into oblivion, as many other schemes in connection with motor cycling have done this last year or two?

Rear Red Lights in Warwickshire.

The first prosecution since the new red rear light byelaw came into force in Warwickshire was brought before the authorities on Monday. Defendant was driving a carrier's cart; he was let off on payment of costs. Every vehicle in Warwickshire after dark must carry a red light at the rear.

Saturday's Trial.

There are over a hundred entries for Saturday's open reliability trial of the Sutton Coldfield A.C., including the majority of the leading trade men. A new figure to competitions of this nature is C. R. Collier, who has entered an 8 h.p. Matchless-Jap.

Arms Hill Climbed.

Arms Hill, near Henley-on-Thames, was the subject of an article in this journal on the 1st inst. Since that date several parties of motor cyclists have journeyed to the hill in order to try conclusions with it. Some photographs appear on page 175.

Universal Rear Lights.

The Bucks County Council decided on the 8th inst. that supplementary byelaws be made by the council requiring all vehicles to carry a red rear light after dark. It is to be hoped that the example which has now been set by Warwickshire, Hampshire, and Buckingham, will be speedily followed by other counties.

An Unconfirmed Rumour.

A rumour to the effect that Jake de Rosier is to ride a Matchless machine in the T.T. Race having gained currency, we enquired of Messrs. Collier and Sons, Ltd., if the report were true, and their reply is that they know nothing of the matter. It is known that de Rosier ordered a Matchless motor cycle when he was in England, as we announced the fact some months ago.

An American Motor Sledge.

A motor cyclist of Columbus, U.S.A., has designed and made a motor sledge driven by the power unit of a 7 h.p. Indian with the usual transmission. The power is conveyed to a motor cycle wheel fitted with a pneumatic tyre, and adhesion to the snow covered ground is obtained by means of a chain which encircles the tyre similar to a Parsons non-skid. The engine, magneto, oil tank, etc., are situate in front of the sledge, and the driving wheel in the centre. The steersman sits behind the steering wheel with a leg on each side of the driving wheel.

Necessity is the Mother of Invention.

One of our staff was riding home one night during the recent severe frost and saw a strange light at the side of the road. On approaching he found it was a small fire, the result of petrol being poured on the road by a motor cyclist. The rider had been held up through the water in the lamp generator freezing, and to thaw it he spilled petrol on the ground, lit it and was holding the generator over the bonfire—"needs must."

An acquaintance recently had the unpleasant experience of a belt breaking at 2 a.m. on a winter's day, and a search in his tool kit failed to reveal the belt punch, so he took out the belt fastening screw, held it in a pair of pliers and made it red hot in the flame of the

SUTTON COLDFIELD A.C. RELIABILITY TRIAL.

The following additional entries have been received for the above trial which will be held next Saturday starting at 9.30 a.m. from the Gun Barrels, Bristol Road, Birmingham. Competitors will be started in pairs at half minute intervals; there will be 1½ hours for lunch at Banbury, and no stop on homeward run.

C. R. Collier (8 Matchless)
C. A. Marshall (2¼ S.I.A.M.T.)
C. Hill (3½ Rudge)
G. Bryant (6 Rex-Jap sc.)
H. F. S. Morgan (8 Morgan)
S. Kempson-Jones (3½ L.M.C. two-speed)
L. Yates (8 Rex-Jap sc.)
N. Crozier (2¼ Levis)
J. Chater-Lea (8 Chater-Lea sc.)
E. T. Hill (3½ Ixion-Jap)
W. Russell (3½ Quadrant)
W. L. Overend (5 P.V.)
T. J. Watson (3½ James 3-sp.)
A. G. Clease (4¼ Calthorpe sc.)
R. Lord (6 Rex 2-sp.)
C. Peers (3½ Lincoln-Elk)
N. G. Blackwell (6 Zenith)
Alec. Walsgrave (2¾ Hazlewood 3-sp.)
W. Sampson (3½ Alldays 2-sp.)
N. Alldays (3½ Alldays 2-sp.)
R. N. Corah (4¼ Corah 2-sp.)
R. E. Guest (6 Matchless sc.)
Roy Walker (3½ New Hudson)
C. Williams (2½ A.J.S. 2-sp.)
H. G. Allen (3½ Humber 2-sp.)
A. G. Fenn (2¾ Humber 3-sp.)
J. Slaughter (3½ L.M.C.)
J. Oliphant (3½ Premier 3-sp.)
H. A. Parrie (——)
R. G. Mundy (Singer)
—— (3½ Rudge)

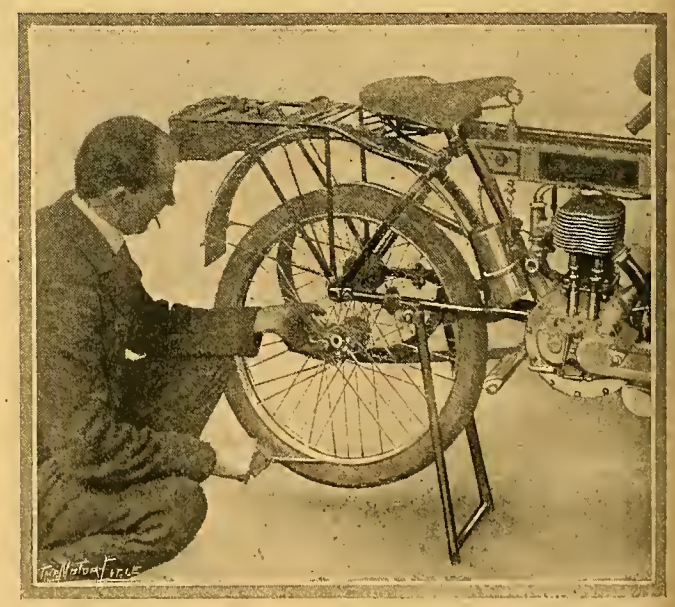
PROHIBITION OF CUT-OUTS ON MOTOR CARS.

The Local Government Board have issued the new regulation with regard to the prohibition of cut-outs on motor cars which comes into force on March 31st next. The wording of the clause is as follows:

". . . shall not use any cut-out, fitting, or other apparatus or device which will allow the exhaust gases from the engine of the motor car to escape into the atmosphere without first passing through a silencer, expansion chamber, or other contrivance suitable and sufficient for reducing, as far as may reasonably be practicable, the noise which would otherwise be caused by the escape of the said gases. Provided that this regulation shall apply only to a motor car propelled by an internal combustion engine and shall not extend to a motor cycle."

As we have already pointed out, the regulation is really unnecessary, as a law is already in existence with regard to noise and the creation of a nuisance, and any motorist (whether autocarist or motor cyclist) can be summoned under this statute if by the use of a cut-out he cause annoyance to others which can be construed as a nuisance.

ENGLISH-DUTCH TRIAL.



THE suggestion of Mr. W. Cooper that the British teams in the above International contest should be chosen by readers of *The Motor Cycle* is a good one, but, having considered the matter, we are opposed to the suggestion, as a referendum among so many thousands of readers entails an enormous amount of work, and we are not disposed to trespass on their good nature too frequently. Further, as readers have pointed out, it would favour men with a large circle of motoring friends.

We have recently had an interesting proposal placed before us by the governing body, the Auto Cycle Union, which is now under consideration, and an announcement may be expected shortly.

Criticising Mr. Palmer Scott's suggestion to choose machines in preference to men, Mr. W. Cooper says:

"Not only is it necessary for the riders to have excellent and up-to-date machines, but it is also most essential that each elected candidate should see that his mount is fully equipped with new (or good) tyres, belts, and especially belt fasteners. I remember failing myself in one of the A.C.U. quarterly trials owing to a broken fastener; and that is why I emphasise the fact that it behoves everyone to see that his machine is fully prepared."

F. C. Wasley, captain of the Bristol Motor Cycle Club, has decided upon a 2¾ h.p. two-speed Douglas, and will ride that mount, if chosen, in the amateur section.

J. McGhie Lamb's patent detachable wheel being fitted to a Bradbury. A detailed description will be found on page 180.

Streatham and District M.C.C. v. Surrey M.C.C.

The following, in addition to those published last week, have qualified for awards in the above inter-team and reliability trial held on the 3rd inst.:

SILVER MEDALS (Highest Award).

Streatham and District M.C.C.—V. Taylor (3½ h.p. Rudge), C. F. Malkin (T.T. Triumph), W. O. Oldman (8 h.p. Bat sc.), J. S. Flood (8 h.p. Chater-Lea sc.), R. G. Mundy (2½ h.p. Singer, three speeds), J. Bateson (3½ h.p. L.A.C.-Jap), and T. H. Kennington (2½ h.p. New Hudson).

Surrey M.C.C.—J. T. Wood (G.W.K. runabout).

BRONZE MEDAL.

Surrey Team.—J. Sparks (four-cylinder F.N.).

W. H. Davey (Streatham and District M.C.C., 3½ h.p. Bradbury sc.) will probably receive a silver medal.

First 1912 B.M.C.R.C. Meeting.

The first Members' Meeting of the B.M.C.R.C. is fixed for Saturday, March 23rd. The programme is as follows:

1 p.m. (For Classes A and B and all sidecar machines).

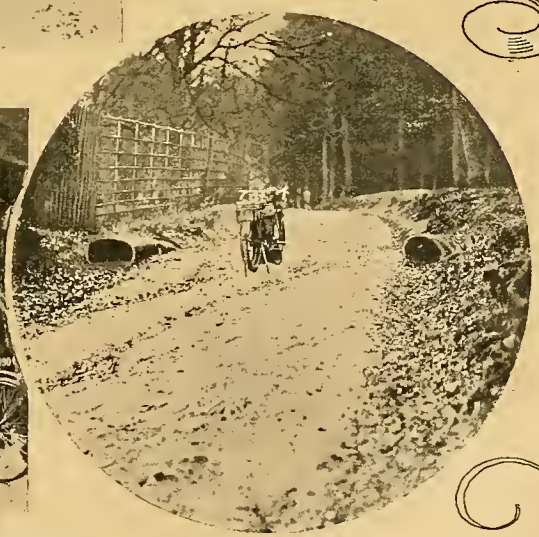
2 p.m. (For Classes C, D, and E).—The 100 Miles All-comers' Race. Competitors will be timed for 50 miles, 1 hour, and 100 miles.

4.15 p.m.—The New-comers' Race for runabouts and quad-cars not exceeding in weight 600 lbs. without driver and passenger. Distance, three laps, or about eight miles.

5.10 p.m.—The Three-lap Sidecar Scratch Race.

The race for runabouts should prove unusually interesting.

CLIMBING ARMS HILL.



ON Monday, last week, in company with N. D. Slatter, I left town early in the afternoon *en route* for Arms Hill. Slatter's mount was his record-breaking 2 h.p. Alcyon, mine being a 2½ h.p. three-speed Singer. After several stops on the road we eventually arrived at the foot of the hill. It was now dusk and snow falling fairly heavily. After lowering gears, an ascent was attempted. The hill is really bad in more ways than one; not only is the gradient terrific, but the surface is very bumpy indeed. Several attempts were made, but as the darkness and snow were against us, we decided to stay the night at Henley-on-Thames. Next morning, the snow having stopped, we were early astir, and went straight out to the hill again. The snow was still fairly thick, but, notwithstanding this, the Alcyon got within twenty yards or so of the 1 in 3 portion, the Singer getting very nearly to the top of this pitch. N. D. Slatter states that he is convinced that he could climb the hill with a smaller pulley, and means to do so directly the road surface improves. The Singer would doubtless succeed on a dry surface.

I made further arrangements for a party to meet at Henley on the following Friday to have a try at this hill. The roads were in a wicked condition, and at the lower part of the hill a patch composed of wet clay had to be crossed, and then the steep pitch is reached. The surface at this point is composed of chalk, and is full of pot-holes. I tried several times on a T.T. Triumph, on each occasion stopping dead on the clay with the back wheel spinning round. Then J. S. Flood (3½ h.p. L.A.C.-Jap single-speed) and H. Garner (8 h.p. Zenith) arrived in company with a local resident on a 1912 clutch Triumph. Garner and Flood tried several times, but on each occasion with the same result as the T.T. Triumph before-mentioned. Garner then attempted an ascent with Flood on his carrier, but after skidding all over they road, they landed in the ditch with the machine on top of them. Darkness was now coming on, so we decided to return to Henley for tea.

On the following Sunday a party met outside the Shepherd's Bush Empire at ten o'clock, their intention being to try several unknown hills. W. L. T. Rhys arrived on his 8 h.p. Zenith, but as he suffered a puncture in his rear tyre he decided to accept W. H. Davey's offer of the seat in his sidecar. After passing over some miles of extremely bad by-roads, we eventually arrived at High Wycombe. About a quarter of a mile from the latter place we found Green Hill, a turning on our right-hand side. Hal Foote (8 h.p. o.h.v. T.T. Bat) made a splendid ascent at his first attempt. An ascent of equal merit was performed by C. W. Meredith (1910 two-speed Bradbury). O. K. Meredith (6 h.p. Zenith) and the writer (T.T. Triumph) failed at their first attempt, having taken the hill on the run without stopping to cool their engines. However, after descending, both came up well. W. H. Davey (two-speed Bradbury and sidecar) put up an excellent performance. He climbed most of the way on top speed. We then had a fine run to Arms Hill. Hal Foote, after only stopping for a minute or so, made a lightning ascent on his Bat geared 3½ to 1. The surface at the lower part of the hill was still in a very greasy condition, and the wet chalk on the 1 in 3 pitch was exceedingly treacherous. He, however, flew over this with his back wheel leaping about all over the road, to the astonishment of the assembled company. After failing twice, O. K. Meredith eventually reached the summit at a good speed, having dropped to a very low gear at the start. Then Hal Foote tried again, skidding very badly in the chalk at the bend; he recovered himself and successfully accomplished the ascent. The next attempt was made by the writer, who skidded and fell. F. A. Applebee (3¾ h.p. Scott) made numerous efforts, but even after wrapping wire rope round his rear wheel he still found an ascent impossible, his back wheel flying round in the chalk on the one in three gradient. The hill still awaits a conqueror on a 500 c.c. single geared single-cylinder.—R.G.M.

(1) A view from the top of Arms Hill. An article in this journal concerning the hill has led to several parties journeying over.
(2) The riders from left to right are J. S. Flood (3½ h.p. L.A.C.-Jap), A. Garner (8 h.p. Zenith), and R. G. Mundy (3½ h.p. Triumph).
(3) On the 1 in 3 portion.

CLUB NEWS.

Carlyle (Chelsea) C. and M.C.C.

The annual general meeting was held at headquarters on the 8th inst., Mr. J. M. Watson (president) occupying the chair. The following officers were elected for the motor cycle section: Captain, Mr. A. J. Brookes; vice-captain, Mr. F. Priston; secretary, Mr. C. W. H. Clark, 69, Comyn Road, New Wandsworth.

Gloucester M.C.C.

The first meeting of the newly formed Gloucester M.C.C. was held on the 31st ult., and forty motor cyclists in the district have signified their intention of joining. The headquarters will be at the Ram Hotel, Southgate Street, Gloucester. The president is the Rev. O. E. Hayden, and the hon. sec., Mr. F. C. Morgan, 156, Westgate Street.

Rotherham M.C.C.

At a meeting held on Friday, the 2nd inst., at Horsfalls Café, High Street, it was decided to form a motor cycle club. All interested are requested to attend a meeting at the above Café on Friday, February 23rd, at 8.30 p.m. Joint hon. secs. *pro tem.*, Messrs. H. Page, Fitzwilliam Road, and R. H. Gilling, College Street.

Bristol B. and M.C.

On Saturday next an inter-team trial (captain v. sub-captain) will be run over a fifty mile course starting from Westbury-on-Trym; marked course, secret check, and no speedometers. On Tuesday, the 20th inst., at headquarters, there will be a paper on "Modern Lightweights" with a junior T.T. Humber as a demonstration machine.

Western District M.C. (London).

A social evening will be held at headquarters, Paul's Restaurant, 4, New Broadway, Ealing, on February 21st, 1912, at 8 p.m., when the hon. secretary will give a lecture entitled "Switzerland and the High Alps," illustrated by lime light lantern views from his own photographs. The opening run will take place on March 3rd, members to meet by the horse trough on Ealing Common at 10.30 a.m. The destination is Wisley Hut, Surrey.

Cardiff M.C.

The members met at the Whitehall Rooms, Cardiff, on Wednesday, the 7th inst., for their annual whist drive and dance. The attendance this year was not quite so good as last year, owing to clashing of dates with other social functions, but nevertheless those present (about 110) had a most enjoyable time. Dancing took place in the Ball Room, whilst the whist drive was held (concurrently) in the Lounge. The prizewinners were: Ladies—1, Mrs. Bishop; 2, Mrs. J. C. Moore; 3, Miss E. Parry. Gentlemen—1, J. A. Dunlop; 2, W. H. Bowen; 3, C. R. M. Peaby.

Hull and East Riding A.C.C.

The annual smoker and prize distribution was held at the Grosvenor Hotel on Friday, the 2nd inst., Dr. W. H. Coates presiding. An excellent musical programme was gone through, and the large number of members and friends thoroughly appreciated the various items. The prizes awarded exceeded £40 in value.

The annual general meeting took place on Tuesday, the 6th inst., when the following officials were elected: Dr. W. H. Coates, president; Mr. Dick Ellis, captain; Mr. J. L. E. Emerson, vice-captain; Mr. A. E. Tuton, treasurer; Mr. J. Fletcher Walton, secretary; Mr. T. R. Langton, trials secretary.

Glasgow M.C.C.

The Glasgow club had its second annual dinner last Thursday at the Corn Exchange Restaurant, when about 100 members and friends spent a most enjoyable evening. The chair was taken by the club's president, Mr. John Gow, who, in replying to Mr. Chas. Middleton's toast of the club, gave a *résumé* of last season's doings, and mentioned that the membership had in a single year increased from 57 to 120. Mr. Norman Macmillan, president of the Edinburgh club, in replying for the guests, asked for a revival of the former inter-club trials and hoped the two clubs would see more of each other in the future. Several speakers referred to the disappointment of Scottish riders and triders in the failure to obtain a motor cycle section at the recent motor show.

North Birmingham M.C.

A meeting will be held at the Acorn Hotel, High Street, Erdington, on Tuesday evening, the 20th inst., to consider the formation of a club for North Birmingham.

Bristol M.C.C.

Mr. A. E. Bennett, of the Bosch Magneto Co., will lecture on Wednesday, the 21st inst., at the B.M.C.C.'s headquarters, Queen's Hotel, Clifton, at 8 p.m. sharp.

Haverstock M.C.C.

The first supper was held at headquarters, the Abbey Tavern, Kentish Town Road, on Thursday, February 8th. The chair was ably taken by the president, Dr. Gibbons, and the members spent a most enjoyable evening. Great thanks are due to Messrs. Richards and Roberts for the splendid way in which they superintended the musical part of the programme. The secretary, Mr. Moliver, 81, Prince of Wales Road, N.W., will be glad to hear from any gentlemen wishing to join the club. The first run will take place on the 25th inst. to Markyate, Herts.

Pontefract M.C.

The annual general meeting was held at headquarters on Wednesday, the 31st ult. There was a good attendance of members. The treasurer presented the financial statement showing a balance in hand of £15 15s. 6d. Among the officers elected were: Col J. R. Shaw, president; Dr. E. M. Dolan, captain and trials secretary; Mr. H. Holmes, treasurer; and Mr. E. E. Vaux, secretary, in succession to Mr. W. Bentley (resigned), who has been secretary since the formation of the club, and who has done much in helping to put the club on its present sound basis.

Cambridgeshire M.C.C.

The annual general meeting was held on Wednesday, the 7th inst., at headquarters. The secretary and treasurer's reports showed that the club is numerically and financially in an excellent condition. Officers elected were: President, Councillor G. O. Palmer; vice-presidents, Ald. F. Morley, Dr. Selby Clare, and Mr. W. King; captain, Mr. H. S. Wallis; sub-captain, Mr. C. W. Wilson; treasurer, Mr. A. B. Hurry; hon. secretary, Mr. W. J Field, 61, Tenison Road, Cambridge.

Sheffield and Hallamshire M.C.C.

The annual general meeting was held at headquarters on Thursday, the 8th inst., with the president, Mr. F. Dover, in the chair. Fifty-three members were present. The balance sheet showed a balance in hand of £6 with stock of the value of £24, and outstanding assets of £4 3s. 6d., whilst the liabilities were nil. The club has affiliated to the A.A. and M.U. The following officers were elected: President, Mr. H. Beshey; vice-presidents, Messrs. Durant, Ardern, Stacey, and Kay; treasurer, Mr. W. Hill; secretary, Mr. D. Bradbury; captain, Mr. C. Bellamy; vice-captain, Mr. F. Cawood.

A photograph sent to us by W. Pratt (the left-hand figure of the three in the foreground), who is enjoying the winter games in Switzerland. He has given up motor cycling for a time in favour of ski-ing. A motor cycle would be of little use in three feet of snow. The children in the background are lining up for a ski race.

Club News.—

Haslingden M.C.C.

A meeting will be held this evening at the Commercial Hotel, Haslingden, with the object of forming a motor cycle club for that district.

Nelson and District M.C.

A general meeting of members and all interested in motoring will be held on Tuesday, February 20th, at the Bull Hotel, Nelson, at 7.30 p.m.

A New Club for Dublin.

It is proposed to form a motor cycle club in connection with Trinity College, Dublin. A good number of motor cycles are now owned by the University men.

Herefordshire M.C.C.

A smoking concert will be held at headquarters, the Mitre Hotel, Hereford, on Thursday, the 22nd inst., at 7.30 p.m. All motor cyclists in the district are cordially invited.

Herts County A.C.

The Motor Cycle Section has had a most successful year. The club has been ably represented in the various open competitions. An excellent 1912 programme has been arranged.

Coventry and Warwickshire M.C.

Some of the forthcoming events are as follows: March 13th—Opening run and speed-judging competition. April 13th—Sidecar trial for machines under 500 c.c. May 4th—Motor cycle reliability trial (open). June 15th—M.C.C. team trial for *The Motor Cycle* Cup. A reconnaissance with boy scouts as the enemy will also be held some time in May.

Mersey M.C.

A lecture will be given on "Speed and Power," illustrated by slides, this evening, at seven o'clock, at club headquarters, by Mr. W. G. McMinnies, all motorists will be welcomed. The club has now extended its operations so as to cater for Southport, and members are being enrolled belonging to that town.

Walthamstow M.C.

The farewell supper to Mr. Fairchild and social evening held at the Essex Brewery Hotel on the 1st inst. was a great success, 102 members and friends sitting down to an excellent repast. Mr. Percival, hon. secretary, reported the club membership as now standing at seventy, and said he hoped to be able to make it 100 this season.

Essex M.C.

The annual general meeting took place on Thursday, the 1st inst., and the following officers were elected:

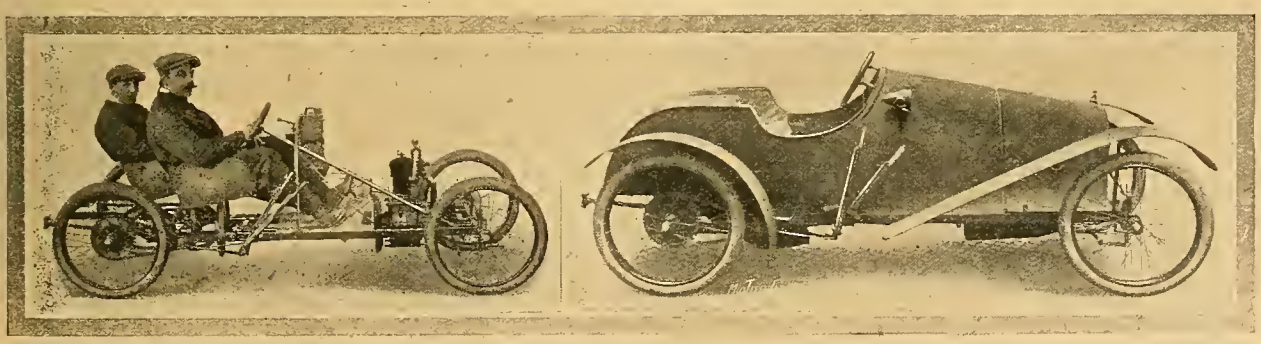
President, Mr. S. G. Cummings; vice-presidents, Messrs O. L. Summers, A. G. Reynolds, and Stenson Cooke; hon. secretary, Mr. D. S. Kapadia; hon. treasurer, Mr. E. G. Bass; captain, Mr. A. P. Howard; vice-captain, Mr. A. E. Brassington; technical adviser, Mr. A. E. Lowe.

Great enthusiasm was shown at the meeting, and there is every probability of a most prosperous year for the club. Motor cyclists and motorists who care to join should write to Mr. D. S. Kapadia, The Grange, Aldboro' Hatch, near Ilford, Essex.

The open hill-climb will take place on March 16th. There will be open classes for all standard types of motor cycles, and members' classes for runabouts and quadcars.

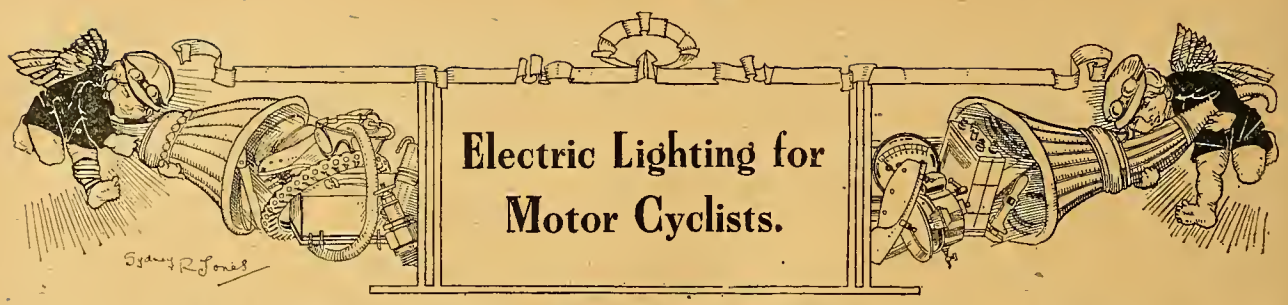
ESSEX M.C. ANNUAL DINNER.

IT was just a nice little family gathering that assembled at the Abercorn Rooms of the Great Eastern Hotel on Saturday last to celebrate the sixth annual dinner of the Essex Motor Club; at least, that is what the chairman, Mr. Stenson Cooke, called it.



In proposing the health of "The Essex Motor Club," Mr. Stenson Cooke made a delightfully frank retraction of an opinion that some three or four years ago he had expressed to the effect that local and county clubs would in the long run fail to justify their existence and die out. In the face of such healthy development as was exhibited by such bodies as the Essex Club he unqualifiedly withdrew his words. In outlining the very strong and ambitious programme for the coming season, Mr. Stenson Cooke laid particular stress on the club's hill-climb to take place on March 16th next. The speaker was glad to add that at this event their friend Mr. Selfe had very kindly promised to help. The chairman then went on to pay a well-deserved tribute to the services that had been rendered to the club by such gentlemen as Mr. George Reynolds, Mr. G. F. Smith, Mr. Owen Summers, Mr. D. S. Kapadia (the secretary), and Mr. Buller.

Mr. G. F. Smith, in replying, made particular reference to the motor outing for crippled children, an event arranged through the good offices of the Essex Motor Club in connection with the Ragged School Union, and one which, to judge by the references of Mr. Smith and other speakers, the Essex Club has particularly at heart, and which the chairman had done much—in fact, almost everything—to render possible. Mr. George Reynolds also responded, and paid a grateful tribute to the assistance the club had received from outside sources, making particular mention of the A.C.U. in this connection.



After the prizes won in the competitions of the past season had been given away by Mrs. Stenson Cooke, the health of "The Visitors, Ladies, and Press" was proposed by the president, Mr. S. G. Cummings, who went straight to the point by saying that they looked to the visitors to increase the membership of the club, to the ladies to encourage it by their presence at its meetings, and to the Press to enhance the work of the club by publicity.

In an amusing and witty speech Mr. Leechman replied for the guests and ladies, while Mr. Meyrick-Jones responded for the Press.

Mr. O. L. Summers then proposed the health of "The Chairman," and referred to Mr. Stenson Cooke's perennial youth, for though he had founded and was conducting an important organisation with a membership of 40,000, he appeared "always merry and bright," and as little worried as a boy—he had almost said "boy scout." Before concluding, Mr. Summers eloquently expressed the gratitude of the club to Mrs. Stenson Cooke for her presence that evening to distribute the prizes, and after the health of the Chairman and Mrs. Stenson Cooke had been enthusiastically celebrated, the Chairman expressed his thanks in an admirable speech of response. Thus ended an evening that will long remain a pleasant recollection.

The latest French production "The Baby" quadcar. This little vehicle has an air-cooled single cylinder engine, propeller shaft drive to a friction-driven countershaft thence by chain to one rear wheel. The driver sits slightly in front of the passenger which reduces the overall width of the body.

Electric Lighting for Motor Cyclists.

NOW that dynamo electric lighting installations have become practically a standard factor in the equipment of the higher grade motor cars it is natural enough to find that those who cater for the smaller wants of motor cyclists are turning their attention to this aspect of the lighting question. The design of a suitable electric generator for motor cycle use is certainly a much more difficult problem than that which confronts him who is making one for use on a car, for, in the first place, not only is space extremely limited, but there is no place in which the dynamo can very easily be installed, also if the article is to have any public demand it must be produced at a comparatively low price. Year by year, head lamps of whatever kind are made of increasing power because motor cyclists wisely insist that it is impossible to have too much light. It may be said, therefore, that the motor cyclist demands almost as much light as the user of a small car.

Prime Cost.

Now, a complete dynamo electric lighting installation for car use costs between £40 and £60, and it is fairly obvious therefore, that some very clever designing has got to be done to bring the motor cycle outfit down to a reasonable figure. A word or two on this very question of cost may not be out of place.

First of all it should be realised that although the prime cost of an electric lighting outfit may be much higher than a similar set using acetylene, with electricity, once the device has been installed; there is practically no further outlay to be considered. I imagine that the average motor cyclist, who covers, let us say, about five thousand miles in a year, probably expends about 10s. in carbide throughout that time. His initial outlay on the lamp and generator would be, probably, about 50s. If then a complete electric installation can be produced at an inclusive price of £4 it will bear close comparison with the acetylene outfit specified above, for, on the allowance of carbide assumed, it will pay for itself in three years, and at the end of that time it is highly probable that it will be worth more than the acetylene head lamp and generator. At the same time it must not be forgotten that with an electric system one achieves a great saving in time, trouble, and convenience, provided that the mechanism be properly designed and satisfactory.

Freedom from Trouble.

First of all, it should require no attention from one year's end to another beyond an occasional spot of oil on the bearings, it is always ready for use, it requires neither matches to light nor fuel for replenishment. It is practically automatic in action, and all the rider has to do is to operate the switch as circumstances dictate. The above facts are given on the assumption that the amount of light given by both systems is about the same. So far, however, only one electric lighting installation has been placed upon the market which gives an illumination comparable to that of a full-sized motor cycle acetylene head lamp. The other two, whilst they do for their size yield a tolerable amount of light, cannot be said to come up to the present head light standards as provided by gas illumination.

Before proceeding to a description of the outfits which are upon the market at the present time, it may not be out of place to suggest an ideal installation; and something fairly close to this the near future will probably bring forward. The difficulties in the way of its realisation, if any, are not insuperable, the only one of any moment being, as pointed out above, the question of production at a reasonable price. The dynamo of the ideal system will probably be incorporated in the ordinary high tension magneto, so that its installation will practically make no increase in the number of working parts.

A Suggested Compound Magneto and Dynamo.

Having passed through prolonged and searching tests, a compound ignition magneto and lighting dynamo on these lines is being placed upon the market for car use; hence there is no reason whatever why it should not be adopted on motor cycles. The ordinary permanent magnets are considerably increased in number as well as in size, and enclose two separate armatures, one of which is wound with a secondary winding in order to give a high tension current for ignition, whilst the other (the two armatures are placed one above the other) is wound to give a continuous low tension current for lighting purposes.

The compound machine is, of course, rather larger than the ordinary magneto, but, so far as motor cycles are concerned, if provision were made for its reception by motor cycle engine designers, any difficulty arising from this source would speedily disappear. The storage battery, which need not, however, be of

THE POLKEY-JARROTT ELECTRIC LIGHTING SYSTEM.

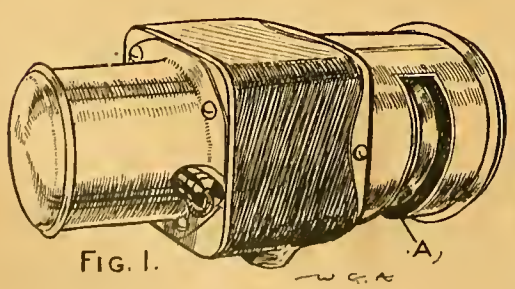


Fig. 1.—The dynamo. A, slot for belt

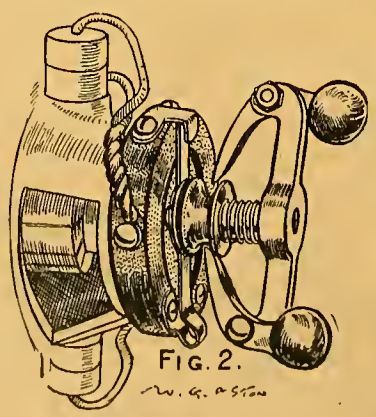

Fig. 2.—Automatic switch.

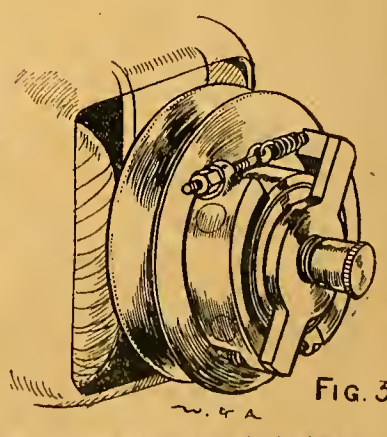

Fig. 3.—Driving pulley of the lighting dynamo connected to the armature-shaft by brake blocks which form governors.

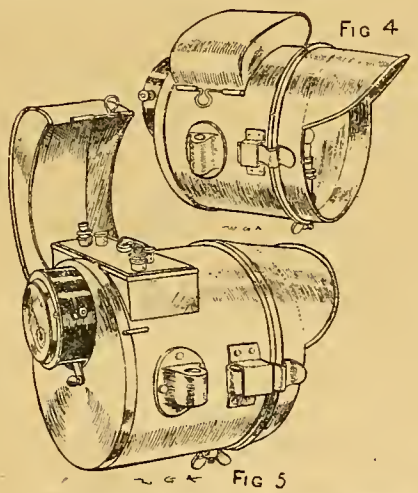
Electric Lighting for Motor Cyclists.—any great size or weight, is desirable, both on practical and theoretical grounds, as, although simplicity may be gained by doing without it, it is almost essential that a light should be available whilst the machine is standing still. At the same time, it is by no means necessary that when so stationary the head lamp should be giving its full power, and it is, therefore, more than probable that the future lamp bulb will be provided with some means by which the light can be turned down. There are three ways of accomplishing this end. First, by using both cells of the battery in series for running and in parallel for standing still; second, by using a special switch, which cuts a resistance into circuit; and third, by having a lamp, which contains in a single bulb two different filaments, one of which is made to give very little light and to absorb very little current. Some such means of turning down the light are highly necessary in a motor cycle installation, because the use of a large battery is out of the question; and if the small one is to have any reasonable life, it is essential to prevent it from discharging too heavily.



Dynamo and Battery for Ignition and Lighting.

Although the combined magneto and lighting dynamo has been suggested as the ideal system, it is only fair to say that there is another which is almost equally ideal, and which stands just as good a chance—if not a better—of coming into vogue. The alternative is to discard the magneto altogether, and put in its place an ordinary dynamo which charges a battery that supplies not only the lamps but the ignition current as well. On the face of it, most motor cyclists would rather deprecate this idea, for they have had in the past a bitter experience of coil and accumulator ignition; but if they would bear in mind the fact that the principal cause of this trouble was the difficulty and nuisance of keeping accumulators sufficiently charged, they would realise that there is much to be said for a syste which essentially overcomes this difficulty and provides them with the means of obtaining an efficient spark quite irrespective of the speed of the engine. Which type will eventually survive would seem to depend largely upon the developments which will in the meantime have been made in magnetos themselves.

The Polkey-Jarrott System.

This installation is practically a miniature reproduction of the Polkey-Jarrott car lighting equipment, and consists of a dynamo and a head lamp containing an accumulator, a switch, and an ammeter. It is, as will be seen, quite the most complete system that has appeared so far, though it is only fair to point out that its cost is considerably greater than that of one or two others.

First of all, with regard to the dynamo. This is intended to be clamped upon the chain stays immediately behind the bottom bracket of the frame, and in that position to be driven from the engine by a belt passing over a special pulley fixed outside the ordinary driving belt pulley. Practically the whole of the dynamo is enclosed, with the exception of a slot cut in one of the end castings to allow the passage of the driving belt. Fig. 1 shows the external appearance of the Polkey dynamo, which is primarily one of the ordinary commercial type with drum wound armature and bi-polar electro magnets. As is well known, the output of such a dynamo is directly proportionate to its speed, and as it is used always to charge a storage battery special means have to be taken, first, to prevent the voltage rising sufficiently high to damage the battery, and, secondly, to prevent the battery discharging itself through the dynamo when the latter is being driven at an insufficient speed to give an output, the potential of which is greater than the battery. In other words, the battery is one of four volts, and hence until the dynamo produces current at this pressure no connection between battery and dynamo must be made, otherwise the current will simply flow from the former to the latter. The devices by which these two things are achieved are entirely mechanical, and work upon a very simple and well-known principle.

Figs. 4 and 5.—Polkey head light with accumulator battery behind mirror and ammeter and switch at back of lamp. In fig. 4 the battery is hidden by the cowl which is shown open in fig. 5.

The minimum cut-out—that is to say, the automatic switch which throws the dynamo into circuit with the battery as soon as its output is sufficient—is shown in fig. 2. Mounted at the non-driving end of the armature spindle are a pair of governor balls supported on bell crank levers. The ends of these levers engage in a grooved reel, which is normally held in position by a helical spring, so that it holds apart the two brass plates which constitute a switch between the dynamo and the battery. When the governor balls fly out at a predetermined speed, the switch is closed, and accordingly the dynamo commences to charge the battery. Below this speed the switch is open, and no passage of current takes place.

Method of Driving Armature-shaft.

The ingenious device by which the predetermined pressure of current generated is entirely prevented from being exceeded is sketched in fig. 3. The driving pulley, instead of being made fast to the armature-shaft, runs loose upon it, and drives it through the medium of a couple of fibre-lined brake shoes, which are anchored on a cross head, this last being permanently fixed to the armature-shaft. As can be seen from the sketch, the two brake blocks form in themselves centrifugal governors, and are held in contact with a drum, which is made one with the pulley by means of adjustable springs. When a certain predetermined speed of armature revolution has been reached, centrifugal force causes the brake shoes to fly outwards, and in doing so they, of course, allow the pulley to slip on the armature-shaft. However much the speed of the pulley be increased beyond this limit, that of the armature remains constant, and hence over-charging of the battery is prevented.

It might be thought that this device would make the armature drive intermittent, but in practice it is found that the alternation between slip and grip of the brake shoes is so rapid that the rotation of the armature remains always absolutely uniform.

Lamp and Battery One Unit.

Figs. 4 and 5 give two views of the Polkey electric head light for use with this set. As will be seen, it is of pleasing and workmanlike appearance, and it must certainly be admitted that it is arranged most ingeniously. In front is a silver-plated parabolic mirror. The glow lamp gives 4 c.p. at a pressure of four volts, and is fixed in an adjustable adapter, so that it can be slightly lifted or lowered, as well as fixed axially, with the mirror. Behind the mirror is a metal compartment containing a four-volt accumulator of twelve ampère hours capacity. The sides of the battery chamber are provided with spring blades, which hold the accumulator firmly in position. The whole is neatly hidden in a quickly detachable cowl.

The Functions of the Switch.

On the back of the lamp is an ampère meter in which is also contained a switch. This ampère meter, when thrown into circuit, indicates the rate at which the dynamo is charging the battery. The switch, which is clearly shown in fig 5, gives three positions. First, it switches the battery into circuit with the lamp, and this is, of course, the ordinary normal position at night; second, it throws the lamp out of action; and third position disconnects the dynamo entirely from the battery so that the latter cannot possibly be overcharged. At the same time the winding of the field magnet is cut out of circuit, so that the dynamo produces no current no matter at what speed it be driven, and, of course, in these circumstances, it takes a quite negligible amount of power to drive it. Even when generating, however, the power absorbed is so slight that it would scarcely make a difference to the running of a lightweight machine, and there is, of course, no necessity to fit the driving belt until the light is wanted, or the battery partly discharged.

The arrangement of the head light is an extremely happy one, as everything is actually under the rider's eye as well as within reach.

The makers of this equipment are the Polkey-Jarrot Electric Equipments Co., Pittsford Street, Birmingham.

(To be concluded next week.)

LEICESTER MOTOR CYCLE SHOW.

MODELS for 1912 of most makes were on view at Leicester on Wednesday last, which day marked the opening of the third annual show in the Y.M.C.A. Buildings.

W. J. Glover and Co., Ltd., had a large and well-staged exhibit, which included Singer, Rex, Rex-Jap, A.S.L., and Bradbury models, and a good show of useful accessories. Among other things they showed us a serviceable waterproof coat which can be worn as an ordinary walking coat or buttoned between the legs, thus forming overalls for motor cycle use.

P llion seat shown by Glover Bros.

All the 1912 Premier models were being shown by H. Jenkins, of Aylestone Road.

Paskells and Keeys were exhibiting Zenith, Douglas, Macbeth, Matchless, and New Hudson models, and were expecting a Clyno at any moment. They also had a nice-looking coach-built sidecar of their own manufacture.

Besides a good show of accessories, T. H. Wathes and Co. had on view a 3½ h.p. Wivern-Precision fitted with the College mud screen, which consists of a neat leather guard extending downwards from the top tube to below the crank case and strapped on to the bottom bracket.

Triumph machines were on view on the stand of C. Williams, of the Y.M.C.A. Buildings.

The Campion Cycle Co. Depot had a good display of their models, fitted with J.A.P. and Peugeot engines and Roc two-speed and Villiers free engine hub.

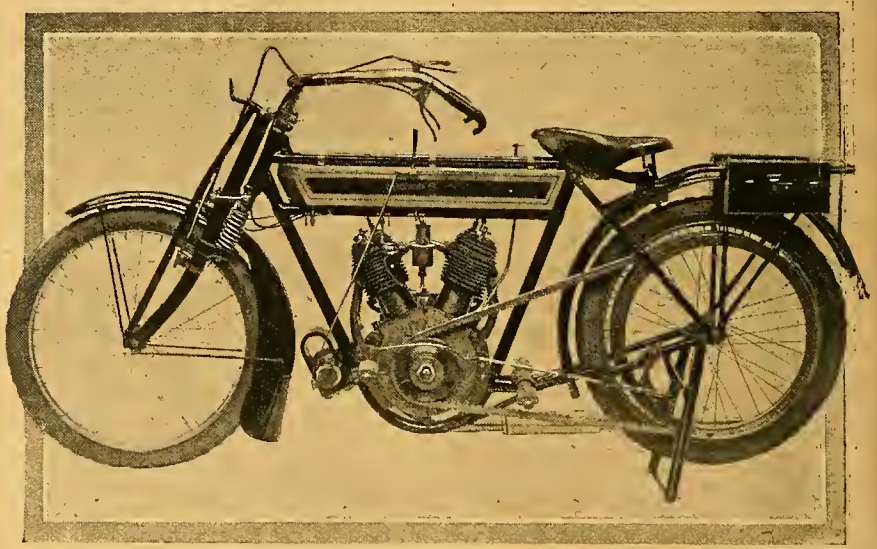
W. H. Chapman exhibited A.J.S. models and an Ivy-Precision fitted with a D.H.K. hub clutch.

Clyde models and a Rollo car were to be seen on Wait and Co.'s stand.

Two tyre firms were exhibiting in the main hall, namely, the Leicester Rubber Co., who were showing the John Bull tyre and a good selection of rubber accessories, and T. Cann, who, besides showing his method of cover repairing by sewing in new pieces, staged a fine display of tyres and 1912 models of the Trump-Jap, Levis, Motosacoche, and Rudge motor cycles.

In the gymnasium Lester and Follweli showed the new B.S.A. models and an A.C. chassis.

The Ebo motor cycles formed a new exhibit. They are on standard lines and fitted with Precision engines. One of those on view had a P. and M. gear. We are informed that the firm will shortly market a two-speed gear of their own design and construction.

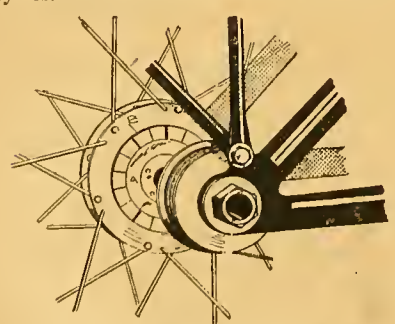


Lucas Bros. showed a large selection of accessories.

Humber models were shown by G. Main and Co.

New Hadleys, Ltd., showed a 2½ h.p. Hobart, and were expecting a L.M.C.

The Quorn Motor Garage staged a 7 h.p two-speed Indian, and Clarke Bros. had a complete range of Pythian-Precision motor cycles, to one of which was attached a Morrison spring wheel sidecar.



On the opening day it was too early to say what the public attendance would be like, but the show was successful and well arranged.

The twin-cylinder loop-frame Clyde-Jap exhibited at the Leicester motor cycle show.

A DETACHABLE WHEEL FOR MOTOR CYCLES.

A few days ago we had the opportunity of examining an extremely ingenious detachable wheel suitable for motor cycles.

Sketch showing arrangement of Lamb's detachable wheel.

The inventor, Mr. J. McGhie Lamb, of Chatham House, Kirkby Park, Kirkby, Lancashire, showed us the device fitted to a standard Bradbury machine.

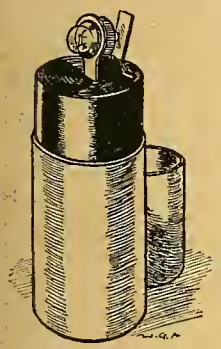
To prove the case of detachment, we may say that we timed Mr. Lamb to detach the rear wheel in under ten seconds, and the front in about seven seconds, and this was accomplished with the aid of one spanner only.

The construction is as follows, and may be easily followed by referring to the accompanying sketch, which shows the forks with the wheel removed. To each fork is rigidly bolted a small hub running on ball bearings. Attached to the off side hub is the chain wheel or brake drum, and to that on the near side the chain wheel or belt rim. (The sketch shows the small hubs, screwed to take chain wheel or brake drum, and spokes for belt rim.)

The tyre rim is carried on a third and central hub which lies between the two small hubs, and is held in position by a bolt which passes through all three hubs. This bolt does not carry the weight, but pulls the outer hubs together, thus giving a frictional support between the face A and corresponding faces on the other hubs. The drive is transmitted to the wheel by means of the dogs B, and thence to the brake drum or pedalling chain hub by similar means.

All that is necessary to detach the wheel is to remove the central bolt, upon which the wheel falls out, leaving the transmission and brake gear untouched. The hubs are so constructed as to be suitable for either front wheel, rear wheel, or sidecar wheel, so that in case of tyre trouble with a passenger machine it matters not in which tyre the trouble lies, for it can be replaced by the spare wheel in a minute or two.

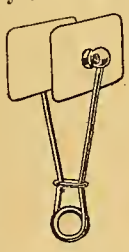
We may add that this wheel has passed the experimental stage, and has undergone long road tests with satisfactory results. It should be particularly suitable for owners of certain chain-driven motor cycles whose rear wheels are not particularly accessible.



Harry Long's Projected Ride.

Mr. Harry Long called on us last Monday and informed us that he would be starting on a long distance ride late in March or early in April, and intended to ride a 4 h.p. Singer two-speed motor cycle and Millford rigid sidecar. His daughter, who weighs nine stones, will accompany him, as the idea of the ride is partly to demonstrate that a sidecar is suitable for an all-weather vehicle for ladies' use. In addition to the coast ride Mr. Long intends to visit every town in Great Britain, and contemplates covering 20,000 miles in six months.

A Miniature Inspection Lamp.

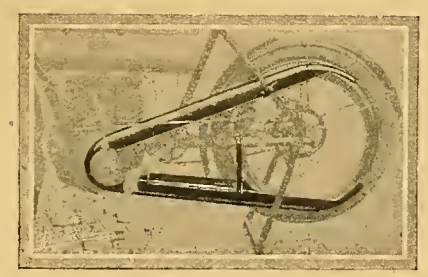


Quite a useful little electric lamp for inspection purposes or for repairs has lately been produced by Messrs. Leo. Ripault and Co., 64a, Poland Street, Oxford Street, W. The lamp is not a toy, as it is provided with a dry battery of considerable capacity. It measures in its case about 5¼in., and will go comfortably into a tool bag. The capacity of the battery is twenty hours continuous working; twenty-five hours if used intermittently. The price of a refill is extremely moderate. A rubber clip is supplied to fasten over the brass contact piece, so that there is no danger of the lamp being lighted accidentally. A permanent light may be obtained by bending the brass strip so that it makes contact with the lamp.

Ripault inspection lamp

Patch Fixer.

A new accessory which is certain to be welcomed by motor cyclists has been introduced by the Dunlop Tyre Co. in the shape of a patch fixer for motor cycle tyres. The function of this tool, which can be carried conveniently in the wallet, is to do away with the rolling on of a patch, and to this end the patched part of the tube is gripped between two plates, pressure being applied by forcing a ring along the arms to which the plates are attached. By this simple operation all air is forced out from under the patch, thereby making a perfect joint when the solution has dried. The fixer will undoubtedly facilitate tyre repair, and help materially to give permanence to the patch.

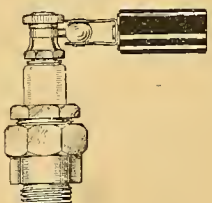


The J.P. Tyre and Belt.

Messrs. John Piggott, Ltd., 117, Cheapside, E.C., have sent us a new pattern of motor cycle tyre for trial. This tyre has a distinctive tread, consisting of hard red rubber. The pattern consists of a single rib down the centre, with a single row of large studs on each side. The cover is constructed on the same lines as a motor car cover, and is built up of three plies of canvas. It is interesting to note that all covers sold by Messrs. Piggott are guaranteed for 3,000 miles. We are shortly putting this cover to a riding test.

Another novelty introduced by the same firm is the J.P. Red Curve belt. This belt is of the rubber and canvas type, with the top made of red rubber. The chief point about it is that it is moulded in a curve, so that it is claimed it fits easily round the pulley, and there is less likelihood of it cracking.

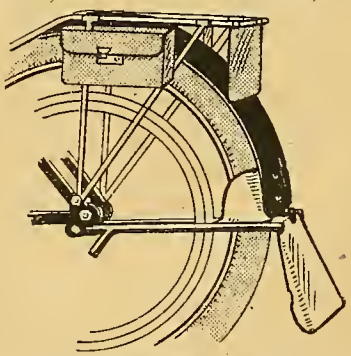
Winter Mudguarding.



Messrs. Grant and Co., 3, Brewers Green, Victoria Street, Buckingham Gate, S.W., have sent us a photograph and model of the G. and G. belt shield. We reproduce the photograph herewith, which is practically self-explanatory. The belt shield is made out of light sheet metal and in the form of the letter U. On the bottom half the U-shaped trough is covered in, the cover being made detachable so that it can be slid on and off for ease of attaching or removing belt. The makers inform us that in the case of belt breakage the belt disengages itself, although the bottom half is running in a tunnel. The shields are made in standard sizes, and are easily fitted.

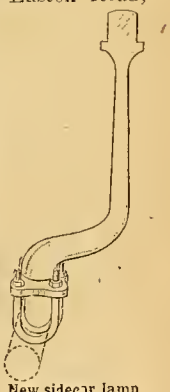
The G. & G. belt shield.

New Sparking Plug.



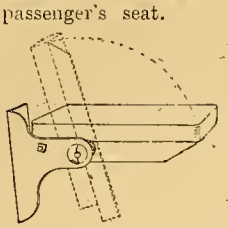
A new plug has lately been placed on the market called the "Re. V.," sold by the Re. V. Sparking Plug Co., 64a, Poland Street, Oxford Street, W. The insulating material is the best French porcelain, and the electrodes are pure nickel. Two qualities are made, one specially for magneto ignition and the other slightly cheaper. The magneto plug has a central electrode and two points from the plug body. In conjunction with this plug a neat form of terminal is sold, consisting of a ball screwed on to the terminal of the plug and a vulcanite terminal, to which the high tension wire is attached. The end of the terminal consists of a spring-steel fork, which is flattened and drilled at the ends. This fork makes firm contact with the ball in whatever position the high tension wire may be.

Re. V. plug and spring terminal.



Back Wheel Mud Flap.

The accompanying sketch shows a mud flap which also acts as a thorn catcher fitted to a B.S.A. It is attached to the stand and hinged so that it may be turned up when the stand is in use. The patentee, Mr. W. R. Blackshaw, Congleton Road, Macclesfield, has, he informs us, tried the device on his own machine with great success. It should certainly prevent the mud from the back being thrown about the machine.



Sidecar Fittings.

Mr. A. W. Bond, 245, Euston Road, N.W., has just introduced a very serviceable sidecar lamp bracket. The bracket is made from an annealed steel casting, finished black enamel, and is provided with a large clip, which surrounds the outer longitudinal member of the sidecar frame, and also one of the flat springs, thus forming an exceptionally rigid fixing, which should carry the heaviest motor cycle lamp. The lamp, when in position, is just forward of the wheel guard, and about on a line with the passenger's seat.

New sidecar lamp bracket.

A child's sidecar seat is made by Mr. E. Farrar, of Halifax. When not in use it springs up into the position indicated by the dotted lines.

A Few Points on Motor Cycle Insurance.

By DOUGLAS LEECHMAN, Barrister-at-Law.

MOTOR cyclists as a body are not as ready to insure as they ought to be. They are too much inclined to take the risks themselves. But this is not a wise course. Not only should they insure, but they should insure their machines before they are delivered. For who can tell? They may have a flare-up the very first time they try to start, and then where will they be?

In proceeding to insure, there is a good deal to be said in favour of carrying out the business through one of the brokers who make a speciality of motor cycle work. They are able to advise the rider as to the companies whose policies are best adapted to his particular case, and as to what stipulations he should make. Further, they are often of assistance in getting claims settled promptly.

In any case, the motor cyclist should obtain copies of the policies issued, as well as of the proposal forms, as then he can see pretty clearly what he is offered for his money. On the back of the policy he will find a number of "conditions," and these should be carefully studied, as by legal interpretation a condition goes to the essence of a contract.

The first condition is as to the notice to be given to the company in case of an accident. Notice should not be required to be given within a specified time, such as forty-eight hours, but only as soon as reasonably possible.

Other conditions may release the company from its liability while the machine is outside the United Kingdom, while it is on hire or being used in speed competitions or pace-making, or by any person who is unlicensed or incompetent. Incompetence is largely a matter of opinion and comparison, and where this restriction is sought to be imposed, the insured would do well to give the company such evidence as they may require of his competence and get "competence admitted" endorsed on his policy.

The condition should not extend to such contests as reliability, speed judging, or consumption trials; though the inclusion of racing and perhaps experimenting and tuition can hardly be objected to as disqualifications. A condition that the injury shall not be increased as by riding the machine in its damaged state after an accident is reasonable.

A more general restriction is that the company shall not be liable when the insured admits to a third party that damage done to the latter was due to his, the insured's, fault. This is reasonable, and it is a matter for thanks that the companies do not always stand by it strictly. On the other hand, care should be taken not to accept a condition of this kind where it is of a sweepingly general nature.

A condition that the machine shall be kept in good repair, and that the insured shall take all due and reasonable precaution to safeguard the machine, is good, as it promotes the mutuality of interests of the insurer and the insured.

Other conditions stipulate that the company shall not pay more than a proportion where the insured has taken out several policies covering the same risks in respect of the same machine; and that the company shall have the right to cancel the policy on notice and return a proportion of the premium. This last would seldom be exercised except where the company suspected they were being "exploited."

Possible Disputes.

Some of the insurance companies connected with motoring associations suggest more or less urgently that any disputes which may arise between the insurer and the insured should be dealt with by a committee appointed by the association from its members. This is excellent so far as the reference of the trouble to a body familiar with motor cycling is concerned. But there the excellence ends. I do not for one moment question the absolute honesty of purpose of such a body, either individually or collectively, but human nature being what it is, a sub-conscious partiality can hardly be absent. Such a committee is hardly likely to have the legal training necessary to the proper handling of evidence, and it also possesses the disadvantage of plurality. This last is an objection to the last condition in some policies which, in requiring that disputes shall be referred to arbitration under the Arbitration Act, also stipulate in effect that there shall be two arbitrators and an umpire. This only leads to unnecessary complication and expense. A single independent arbitrator is all that is required, and he gets through the work with a minimum of delay and expense.

Proposal Forms.

When it has been decided which company shall be selected, the proposal form must be filled in with great care and perfect good faith, as any material misstatement therein will entitle the company to repudiate its responsibility should a claim be made against it. In this connection, I think it is a pity that some of the proposal forms issued are of such restricted dimensions. If the companies want proper answers to their questions they should provide at least reasonable space in which to answer them. For example, it is a little difficult to write a full address in a single line less than 2½in. long, while the allotment of an even smaller space in which to give a detailed account of any accidents caused or suffered by any motor cycle owned by the proposer is little better than an inducement to write the single word "none." However, the owner should give full particulars in an accompanying letter if necessary, and put "see letter" in the inadequate spaces.

The particulars of machine must be accurately filled in, and as the registered letter and number are asked for, it will be necessary to get the machine registered before it can be insured. Sometimes the number of persons carried or the number of seats on the machine has to be stated. In the case of a bicycle one would naturally put "one," and under these circumstances it would be quite open to the company to refuse to recognise a claim if the accident arose while a passenger was being conveyed on the back carrier. As a matter of fact, most of the companies are willing to waive the point, but it is prudent to state on the form that a passenger may sometimes be carried on the machine, if the case, and get a note endorsed on

A Few Points on Motor Cycle Insurance.—

the policy acquiescing in this. Of course, if a sidecar or forecar is to be used, this should be definitely stated on the proposal form, and an increased premium will have to be paid.

Answers to Questions.

No difficulty will be experienced in answering the first few questions set out on the form, but the query relating to the use to which the machine will be put requires some consideration. Naturally, a machine that is used for pleasure purposes only will not be ridden as much as one that is employed as a business vehicle. Further, the former will be used mostly on open roads, while the latter will probably encounter a good many of the risks due to congested traffic. If the owner intends to use his machine only for holiday and leisure time riding, he can answer the question, "Will the machine to be insured be used solely for private pleasure purposes?" in the affirmative. But if he do, he must not be surprised if the company refuse to acknowledge his claim made in respect of an accident which occurs on his riding in to work some fine morning, or when riding over to a neighbouring town to do a little business that happens to require his attention. Using his machine for either of these purposes is not using it for private or pleasure purposes only. True, probably most of the companies would admit the claim, but they would do so as a matter of grace only. Some of them will even allow the insured to use the machine as his ordinary means of conveyance to and from his place of business and still hold themselves liable. But if the owner wishes definitely to cover the risks attending occasional or partial business rides of this kind, he should say so in his proposal, and see that a corresponding endorsement is made on his policy. And if he be asked to pay a little more he should not grumble; while, if he be going to use his machine for commercial travelling or similar business purposes, he must say so clearly and pay accordingly.

Machines Ridden by More than One Person.

Another question is, "Will the machine be driven solely by the proposer?". Here again it is rather unwise to reply simply "Yes." No doubt you buy a motor bicycle for your own riding, but there may be a few occasions when you will wish someone else to ride it. "Ixion" may come along and be persuaded to run it a short distance to see if it is well tuned; or towards the end of the season a prospective purchaser (after having deposited the cash) may be granted a trial trip. The better answer to this question, therefore, would appear to be a qualified one, "Yes, as a rule," or something to that effect, and if the company want an explanation you can give it. Sometimes the insured is asked if he is suffering from any physical infirmity, especially if he is insuring against personal accidents. This question, like all the others, should be answered with perfect good faith. If you are aware of any defect, mention it, and if you are at all uncertain, get the company either to accept your doctor's certificate or let their own doctor examine you. It is no economy to get the company to accept you—and your money—and then, when you have a smash-up, find you are not entitled to receive any compensation, because you have, even innocently, misrepresented the true facts.

The most important risk to insure against is what is often called "third party" claims—that is, claims by members of the public for injury to themselves or their property occasioned by the motor cycle. Other risks are accidental damage to the machine by impact, ditto by fire, theft, and injuries to the owner.

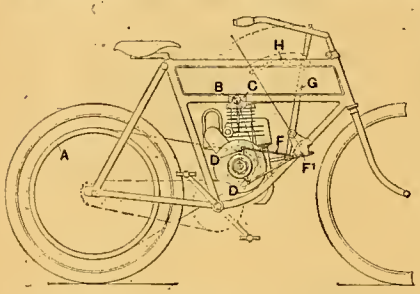
As to the claims by the public, there is no saying how many of these may be made during the course of the year, nor how much each may run to, so that there should be no limit in the policy to either the number of accidents or to the amounts involved. Further, not merely the "claims" should be covered but also all law costs which may be payable.

Accidental damage to the machine is often confined to damage by impact or collision. This seems unnecessarily restricted. At least one company's clause indemnifies the person insured against damage by "accidental and external means," which is a good deal wider than mere impact or collision. This company holds itself liable, too, for consequent damage caused by mechanical breakdowns.

Some companies even refund the cost of removing the machine from the scene of accident to the repairers and back to the owner.

Claims and Repairs.

Each policy is accompanied by a claim form, and when an accident occurs it is best to make the claim on this form. As a general rule, repairs must not be commenced without the company's consent, but this is now frequently modified, repairs up to £2 or so being allowed to be proceeded with forthwith, if a written estimate signed by a qualified repairer be first sent in to the company. This is a great convenience when one is touring. Information of the accident should always be given to the company where there is any possibility of a claim being made by a third party. The insurance companies are generally glad to make a substantial reduction from their premiums if the insured will bear part of each loss or damage—say from £1 to £5—but, as a rule, it is not wise to avail oneself of the offer. Most of the injuries sustained only cost a pound or two to rectify, and for these the rider would be largely or entirely uncovered.

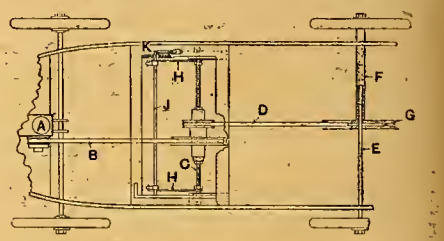


A KENT CROSS-ROAD IMPROVEMENT.

At the foot of Farnborough Hill, on the Sevenoaks-Hastings Road, open rails have been substituted for thick hedges at the corners, thus allowing a clearer view of oncoming traffic.

A Zenith Construction.

In the well-known Zenith machine the belt slack resulting in the use of a variable pulley is taken up by sliding the rear wheel in the frame. In the construction now illustrated, the wheel A is held rigidly, and the engine itself is moved to take up the slack. The cylinder head is pivoted at B to a bracket C rigidly secured to the frame, and is adapted to be oscillated about this pivot by a hand lever G working over a quadrant H. A variable pulley of suitable type is employed having



a pair of operating arms D, connected to links pivoted to an anchor on abutment

PATENTS by Eric W. Walford F.C.I.P.A.

F. The operation of the pulley is such that as the engine is swung about its pivot by the lever G the arms D are rotated in opposite directions about their axes, and vary the distance between the pulley flanges. The parts are so designed that the variation of the pulley is in suitable proportion to the movement of the engine, so that the tension of the belt remains constant for all changes of gear. Means of adjustment are provided by the screws at F1.—Zenith Motors ,Ltd., and C. M. Smith, No. 485, 1911.

A Slipping Differential.

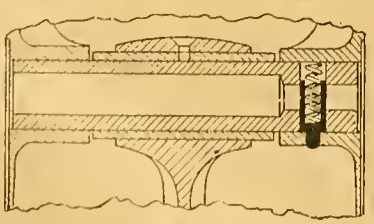
This invention is illustrated in the accompanying plan view as applied to a light vehicle, driven by V belts. Motion is transmitted from the engine A by a belt B to a counter-shaft C, and therefrom by a belt D to the rear axle. The axle is constructed in two parts, an inner part E carrying one driving wheel and an outer sleeve part F carrying the other. Each part E and F carries one flange of the pulley G, so that when the belt D is slacked off the two pulley flanges may move in relation to one another when travelling in a curve. Slacking of the belt D is provided for by mounting the counter-shaft C to slide in the

frame, and providing it with operating mechanism consisting of links H connected by a rod J to the lower end of a pivoted lever K, oscillation of which effects the desired object. — G. Armstrong, No. 29,539, 1910.

Trade Announcement.

B. Alan Hill has joined the staff of the Hendee Manufacturing Co., W. A. Sale having resigned his post

An Unfounded Report.



We are asked to deny a report that is current that Messrs. Brown and Barlow are giving up the manufacture of their universal type of racing carburetter, owing to its being unsatisfactory. The carburetter is not only a great success, but is enjoying a large sale.

Silent Chain Transmisson.

Hans Renold, Ltd., Manchester, are making a special silent chain suitable for chain-driven motor cycles, particularly those where a counter-shaft gear is fitted behind the engine and chain drive used from engine to counter-shaft. The new chain will be ½in. pitch by ⅜in. wide, and in place of the centre guide usually employed with silent chains for motor car transmission to prevent the chain riding off the pinions, shrouds will be fitted to the side plates.

Gudgeon Pin Fixing.

The accompanying illustration is that of the gudgeon pin fixing used on the 3½ h.p. Rover engine. The small spring-controlled plunger should be pushed up from underneath with the aid of a piece of wire or the end of a file, when the

gudgeon pin can be knocked out from the other end. When removing the Rover gudgeon pin, it should never be knocked to remove it until the plunger has been first of all forced upwards.

SPARKLETS

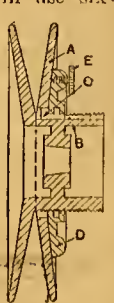
Catalogues Received.

As might be expected, the 1912 catalogue of the Indian motor cycles is an interesting one. Both models are well illustrated and described with a specification of each printed underneath the illustration. Eight pages are devoted to descriptions and well executed half-tone illustrations of Indian features, among which are the new rear hub, foot starting device, and rear wheel brakes. Interested readers can obtain copies on application to the Hendee Mfg. Co., 178, Great Portland Street, W

The Ariel 1912 catalogue is a well got up booklet, describing and illustrating the various models and chief features of these machines. There are also detailed illustrations of the Ariel features, hints on adjustment, lubrication, and timing of the engine. Application for copies should be made to Components, Ltd., Ariel Department, Bournbrook, Birmingham.

An exceedingly well got up catalogue, which is of inestimable value to Triumph users, is the "Triumph Repairs and Parts Catalogue," in which every single part of a Triumph machine is priced and listed. The lists are considerably aided by clear illustrations, in which each part is numbered and shown photographically. At the end of the booklet there is a list of accessories. The Triumph Cycle Company also send a copy of their 1912 catalogue of Triumph motors, which is a most artistic production printed in two colours In addition to illustrations and specifications of these well-known machines, the constructional details are very fully described and illustrated by half-tone blocks, showing many of the principal parts in section. Most of these are exclusively Triumph details, which cannot be seen in any other catalogue Application for copies should be made to Coventry.

A New M.R. Hub Clutch.

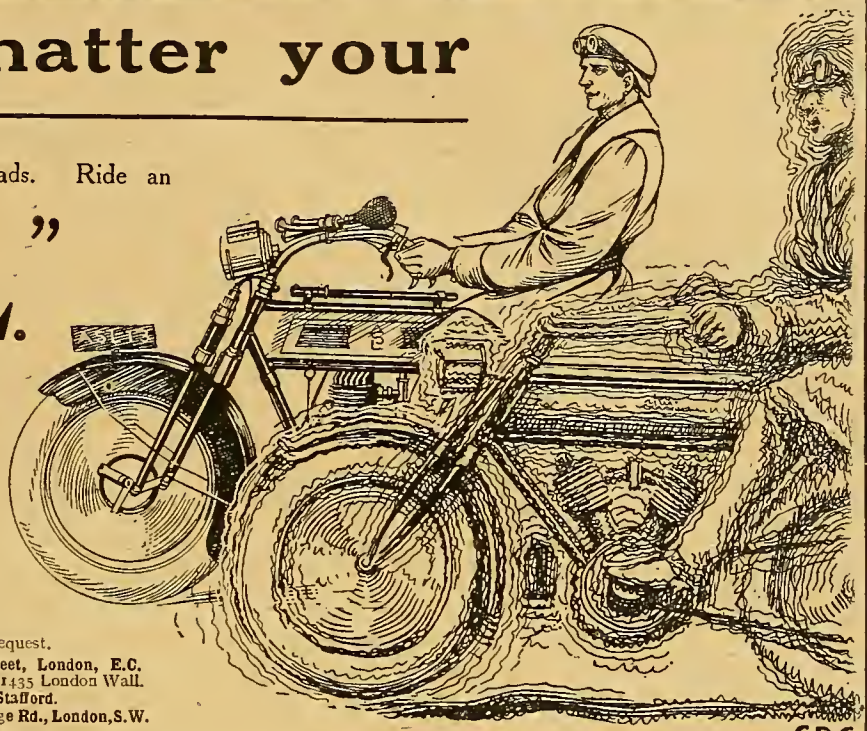


The Moto-Rêve Company are now fitting a multiple disc type hub clutch to their twenty-seven guinea model which enables the engine to be started by means of the pedals with the back wheel on the ground. The extra cost for this improvement is quite moderate, and will largely add to the convenience of this particular pattern.

Carburetter Valves Sticking.

The Aston Motor Accessories Co., Ltd., Aston, Birmingham, inform us that as there has been considerable prominence given in descriptions of winter trials to the trouble of carburetter valves sticking, they have pleasure in stating that of all the complete carburetters sent out of their latest pattern they have up to now received no complaints.

An Adjustable Pulley.



Mr. C. D. Bird sends us details of an invention which he has had in use six months with great satisfaction. The flange A screws on the boss B, and has eight keyways cut in it. The key C, which slides in a keyway on the boss, can be made to engage with any of these. This key is moved by the adjusting flange D, which also screws on to the boss B, and is locked by the screw E. The key is made slightly taper to facilitate its entrance into the keyways on the movable flange A. No tools are required for the adjustment of this pulley.

Don't shatter your nerves

by bumping over rough roads. Ride an

NEW EDITION
. . NOW READY . .

"MODEL FLYING MACHINES"

Their Design and Construction

(Second Edition).

Revised throughout, Enlarged, and brought right up to date.

A handbook devoted to the construction of practical models of flying machines of all types. The greater part of the book is devoted to aeroplane models, but special chapters are included, dealing with direct lift and flapping wing types, and also with model dirigibles.

Profusely illustrated from drawings by the author.

The advice given is the result of the personal experience of the writer, and the book will be found of the utmost service to all who follow the fascinating and instructive hobby of making and flying models.

	Assorted New Machines of various kinds	..			5,000	0	0
	TOTAL ..				£36,117	12	0

The above is a sum in arithmetic, and represents a portion of the New stock that Hitchen's have purchased for the coming season, 1912. All these machines have to be sold, and we look to you to help. A considerable number are already booked, but we have PLENTY FOR EVERYBODY, and anticipate your kind assistance in the matter of shifting them.

We believe we are correct in supposing that no other firm in the Kingdom has placed such large contracts for 1912 machines. We are out on the JUMP ourselves, and we hope that you are THE SAME; if not, it is time that you were, unless you wish to be left like a pebble on the beach when the tide has gone back. It is NO USE writing to us in June, as the machines will then be sold up, and the bhoys riding them. If you want a machine, GET A MOVE ON YOU, and come Morecambewards at once and see us; or if you can't, write us.

We can take your old machines in part payment for many of these, and we can sell you a machine on the Deferred; we can sell you a machine for cash! Besides the above, we have £3,000 worth of Second-hand Machines on the premises at the moment; all sorts, all sizes, and all ages—most of them, however, 1910 and 1911. Our stock of scrappage is very small! However, we have a few that we can sell the bhoys at a nice handy price for £3 down and the balance by instalments

When you have made up your mind what you are wanting to buy, don't waste a minute, but get on the buzz, and let us have your order. We would be sorry for you to find that when you are wanting, say, a Clyno, and write up to Morecambe, that Hitchen's are sold up for a month or two in advance—perhaps more. This year is going to be a KNOCK-OUT season, the biggest in the History of the Motor Cycle boom. While it is on, get on the hop, and have your machine bought. Don't pride yourself on the fact that the boom will be over by and by! Now is the time to buy. Write us, and we will put you on the right track. If you are undecided what to buy, get into touch with us and get the benefit of our experience. Our opinion will be unbiassed. We have always some of everything, and can guarantee you a right thing for your requirements. Amongst the above, you will note that threequarters of them are two-speed sidecar machines. These, together with the A.C. and Morgan Runabouts, are the **coming thing.** If you once go in for a sidecar machine, you will not give up motoring. We can supply you with these at from **£15** to **£75.** We do not tell you that one at the former price is as good as the latter, or that you can go anywhere with a 3½ h.p. machine and sidecar, because you cannot. WE can give you GOOD VALUE for your money.

You will notice that we are extensive advertisers, but we keep our yarns within the range of truth, and do not wander away and tell you a lot of bunkum.

We are still at the old, old game, bhoys! sending you goods for three days on approval. If you don't like them, send them back, and have your money back in full. We feel sure that any deal you put in hand with us will be well attended to and give you every satisfaction.

While we are on the question of sending goods on approval, we would draw the attention of a few Sunny Jims to the fact that because we do more for the public than anyone else, it does not justify them thinking that we are doormats. For instance, it is no use sending for an article and keeping it for a fortnight, and then return it and ask for your money back, as this is beyond our scope entirely, and we are not "having any." If you cannot find out in three days whether a thing is to your satisfaction, you will not do so in three months. However, you will not have your money back in this case, but what we will do for you is to exchange it. This will apply to everything. To make it clear to all, at any time within THREE DAYS we will return the money, but we will not do so **after three days.** We will exchange the goods any time, but we **will not** return the money after then. Please GET THIS HOME. It is no use writing saying that you are the Captain or Secretary of a Club, and that you will not recommend us if you don't get your money back. Neither is it any use saying that if we send your money back you will buy everything you want from us between now and the millennium; or again, it is useless saying you will tell Mr. Editor if we don't send your money back as this is all away from the mark. We have a system of business that we adhere to, and we intend YOU to DO THE SAME.

If you want anything plainer than this, write to Morecambe, and we will give you a packet on your own.

Another little thing which has dawned upon us is that when we send goods on approval, we expect to get them back—if they are returned—in the same condition as when despatched from here. We don't accept broken articles. If they are broken when received by you, you must at once claim from the Railway Company. If you break them yourself, you must be responsible. We pack all our articles very well, and send them per passenger train at company's risk. If you instruct us to send same per post, and they are lost, you must accept the responsibility yourselves. Occasionally some Sunny Jim asks to have a motor cycle and sidecar sent at Owner's risk and when the articles get damaged they expect us to make the damage good. This is a luxury we certainly cannot indulge in. If you leave the matter in our hands, we will send at Company's risk, but we accept no responsibility after the goods pass into the company's hands at Morecambe Station. If this cap fits you, put it on, but don't be insulted, as a lot of you have "asked for it" for two years now.

Note our old address, where we will be pleased to have your kind enquiries and orders.

HITCHEN'S, Euston Road, Morecambe.
'Phone: 112 Morecambe. Tels.: "Motor, Morecambe"

By the by, we have now got two canaries, so we want more orders for the seed pots.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

Write for a copy. Send details of your used motor cycle and receive our unequalled liberal exchange offer for same in part payment of a latest 1912 model.

Wauchopes
OFF FLEET ST., NEAR LUDGATE.
Telephone: 5777 Holborn.
Wires: Opificer, London.

9, SHOE LANE, LONDON, E.C.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or it "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

SECTION I.

Northumberland, Cumberland, Durham, and Westmoreland.

NEW Triumphs, ready for delivery, also new 1911 model; what offers.—Walker's.

SECOND-HAND Motor Cycles.—We never hang on to second-hands. A quick turnover is what we want, and that is why we offer second-hand motor cycles at pounds below other houses. We have just received delivery of a large number of new 1912 Douglas machines, and have placed these with customers who have exchanged their 1911 and 1910 mounts. You know the saying, "Once a Douglas rider always a Douglas rider." These second-hands are being thoroughly renovated, and will be cleared at bargain prices. 1910 Douglas, from £22. 1911 Douglas, from £27. £25 spent on a Colmore Douglas will prove a fine investment. Let us send you a list of about 60 really good second-hands in stock.—Colmore Depot, 27, Colmore Row, Birmingham.

SECTION V.

REX-J.A.P.

1912 REX-J.A.P.

— the Motor Cycle of the year

and the machine you should purchase if you require a powerful, reliable, Motor Cycle, easy running, simple to drive, capable of climbing any hill with sidecar and passenger, and with Frame and Tyres which will stand the strain.

THE CLUTCH AND TWO SPEED GEAR, with handle starting, live axle (made under 'Roc' license) is self-contained, of simple construction, and highly efficient, the belt speed being constant. Direct drive on top speed. Correct gear engagement is positive. Either gear may be engaged without passing through the other.

ONLY TWO PEDALS—there can be no mistake in selecting the gear, so that speed changes may be made confidently. Simply "Press the Pedal" and the clutch engages gradually, smoothly, and without shock. The machine can be started on any hill. It gives you perfect control in traffic, and enables you to stop and start at will without leaving the saddle. It is the only perfect, reliable clutch and two-speed gear for Sidecar work, and has been fully tested and proved.

We shall be pleased to post you Catalogue describing the many advantages of this unique machine.

Free Engines in Important Trials.

ONE of the regulations for the Auto Cycle Union one-day trial reads as follows: "To qualify for a first-class certificate the machine must be equipped with either a free engine or variable gear." This rule has caused some heart-burning, but those who think they have a grievance against the Auto Cycle Union on this score should bear in mind that the A.C.U. trials are not run as sporting events, but for the general improvement of motor cycles. The regulations for the A.C.U. one-day and other trials were threshed out at joint conferences between members of the trade and the A.C.U. Competitions Committee, and the above rule is the outcome of these deliberations. Those who find themselves barred from the A.C.U. trials because they own machines that are not fitted with either variable gear or free engine should console themselves with the reflection that, although they are prevented from taking part in the important A.C.U. events, there will be a great many club competitions open to them during the year in which they will find plenty of opportunity to display their sporting instincts which inspire them with a desire to oppose their single-geared clutchless mounts against those provided with change-speed gears and free engines. The grumblers should also remember that the rules are framed to assist the improvement of the very mounts which they will probably purchase at a later date. Those who complain of the regulation say that with pedal assistance they could climb all the test hills. In our opinion, however, the A.C.U. is quite right to prohibit pedalling, as the public wants to see and hear of what the engines can do, and is not particularly interested in the muscular efforts of the rider.

L.G.B. and the Cut-out.

THE announcement that the new regulation with regard to cut-outs does not extend to motor cycles can only be interpreted as a somewhat lenient view taken by the Local Government Board, and a decision which has doubtless been arrived at as the result of the tests, recently described in these pages, whereby the L.G.B. officials had proof that, if cut-outs were absolutely prohibited on many makes of motor cycles, it would seriously hamper the industry at a most inopportune time. Now while the Board state that they have not found it possible to deal with the use of cut-outs in connection with motor cycles in the present order, they are considering the practicability of requiring motor cycles to be fitted in every case with a suitable silencer for reducing noise, a source of annoyance to others. We feel confident that the L.G.B. have waived the question of prohibiting cut-outs on motor cycles only for a time, as they thoughtfully decline to interfere with manufacturers' designs at this juncture. The absolute prohibition of cut-outs would have meant a serious loss to manufacturers at this season of the year when deliveries are being urgently hurried forward, but it is certain that they will insist upon efficient silencers being fitted in the future. The exemption of motor cycles, therefore, should not be taken too lightly, and increased efforts should be made to reduce noise as much as possible. With the cut-out closed there are several makes of motor cycles which run quite silently; therefore if the L.G.B. could see their way to allow a reasonably sized cut-out to be fitted on the silencer only and to institute proceedings against riders who make themselves a nuisance by indiscriminate use of the cut-out, their action would be welcomed.

ONE day last week we made our annual pilgrimage to Stoneleigh Hill, the testing ground of Coventry motor cycle manufacturers, and found the hill literally alive with testers on new pattern motor cycles. Never have we known such an animated scene, and it is just a further instance of the wonderfully increased activity in the motor cycle world. Similarly, just as the pronounced increase in the number of motor cycles on the road is apparent, so is the marked increase in efficiency of the present-day engine—for that unit, after all, is the heart and soul of a motor cycle. First of all one of our photographers demanded the attentions of the group, which, by the way, was constantly increasing in numbers as one by one the testers arrived to carry out their daily task. What a jolly lot of fellows these testers are! Good natured chaff is their usual greeting, and not only the riders have nicknames but their machines have some weird pseudonym typical of a peculiarity they may possess—none too complimentary to the makers in some instances, for the tester is a wily bird.

The Ignominy of Knocking.

Should some unfortunate tester muddle his ignition or air lever and cause his engine to omit a knock, it is immediately echoed and reverberated down the hill, and in bad cases the defaulting tester has no peace the rest of that day.

On the occasion of our visit there were Humbers, Rexes, Triumphs, Premiers, Rudges, Hazlewoods, Rovers, and Singers being tested up the hill, and what a pace some of them attained on the 1 in 9 gradient! Of course, 1 in 9 is nothing to a motor cycle nowadays; but Stoneleigh happens to be the steepest hill within easy reach of Coventry, so other methods than a mere rush up the gradient have to be resorted to. Some

Four passengers on a 6 h.p. Rex sidotte, which took the load up the hill with ease.

A Morning with the Testers.—

makers, for instance, specify that the machine shall climb the hill from practically a standing start on a higher gear ratio than standard, others demand that the machine shall take two riders up the hill at full speed, and we watched with interest the machines swoop up the hill one by one till it got monotonous. After watching a 3½ h.p. Rover and Triumph take an extra rider up, which performance was easily overshadowed by a 2½ h.p. lightweight Singer which followed their example, we suggested that someone should try three on the machine. W. F. Newsome was the first volunteer, and the spectators thought he had done something wonderful when he succeeded at the first attempt. His pace at the top we estimated at 22 m.p.h., which led us to suggest

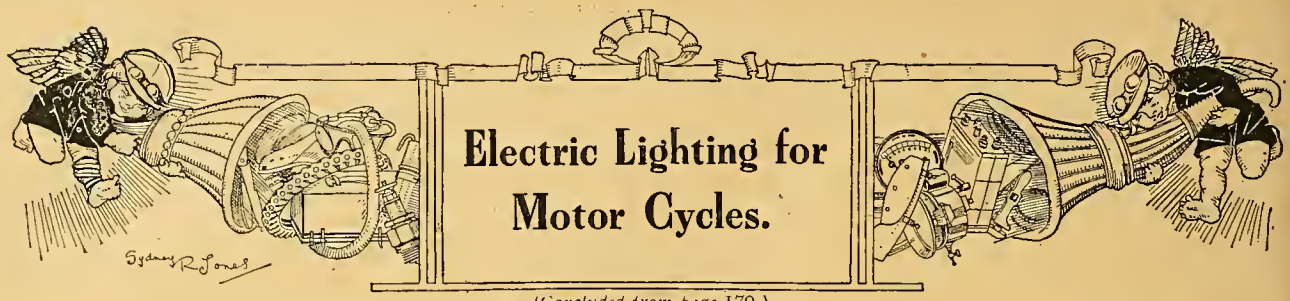
Still Another Passenger.

But the difficulty was how to pack him on the machine. Young Crawley first clambered on to the handle-bars, but in this position the driver was afraid of the right angle bend at the hill foot. Eventually, by squeezing two on to the saddle, Crawley was crammed on to the carrier tail, and the ascent commenced. To everybody's intense surprise and admiration the machine with its human freight of 37 stones sailed up at a good bat, the engine never once raising signs of distress. We measured the gear ratio and proved it to be 5⅛ to 1, so what would a 1912 Triumph do with the limit ratio of 6¾ to 1? Next F. H. Ayres, an ambitious rider of a low geared 2½ h.p. Singer, tried three up, but after a brave show he stopped on the steepest section, which is 1 in 8.9.

Meanwhile, a couple of twin Rex machines put in an appearance, and what a fine engine the 6 h.p. m.o.i.v. with side by side valves really is. A soothing purr from the long exhaust pipe, and that is all one hears as it regularly sweeps over Stoneleigh with a sidecar and passenger on top gear of 4 to 1. The limit of its capabilities was not reached when it climbed the hill with four up on a gear of 8 to 1.

Seven different makes of motor cycles at Stoneleigh last week. Left to right: Hazlewood, Rover, Triumph, Humber, Rudge, Premier, and Singer. The Rex arrived later.

A Standard 3½ n.p. free engine Trinmph climbing Stoneleigh with four up.



This was the first occasion we had seen the three-speed Hazlewood perform on a hill. One with a 2¾ h.p. engine made no mistake about the way it went up on the middle gear even with an extra passenger on the carrier. The Rudge, Premier, and Humber riders were content to make the usual test ascents without attempting anything sensational.

After witnessing the single-geared clutch machines restart on the steepest section with an extra passenger on the carrier we left with a firm conviction that the general all-round improvement in 1912 engines is more real than some would have us believe. Progress is slow but sure, and the commencement of every year marks a decided step toward the attainment of the ideal motor cycle.

L.G.B. AND THE SILENCER CUT-OUT.

Official Notification.

WITH reference to the paragraph published last week on the prohibition of cut-outs on motor cars, the Local Government Board point out in a circular letter to *The Motor Cycle* announcing the new regulations, that, although "the Board have not found it possible to deal with the use of cut-outs or similar contrivances in connection with motor cycles in the present order, they are considering the practicability of requiring motor cycles, when used on the public highways, to be provided in every case with a suitable or sufficient silencer for reducing the noise commonly caused by these vehicles."

Electric Lighting for Motor Cycles.

(*Concluded from page* 179.)

The Voltalite.

The Voltalite, whilst being a much more modest instrument than the one described above, is, nevertheless, an extremely practical and simple little device, which is produced at so low a figure as to bring it well within the reach of all. The drawing of the complete dynamo, which together with the head lamp forms the complete installation, is given in fig. 6. It consists of a pair of specially shaped permanent magnets between the pole-pieces of which runs an H section armature, very similar to that of a magneto. The whole is encased in an aluminium dirt and dust-proof case, and the armature runs on self-contained ball bearings which are carried in gunmetal end pieces. The armature-shaft terminates in a rubber-tyred friction wheel, by which the dynamo is driven from the rim of either the front or back wheel of the machine, and for this purpose special brackets are provided for attachment of the device into whichever position is found most convenient. Wires are taken direct from the dynamo to the lamp bulb, no automatic switches being in this case necessary.

The reason of this is that, owing to the use of permanent magnets the magnetic field in which the armature revolves remains to all intents and purposes absolutely constant in intensity, and hence the voltage of the current generated does not rise with an increase in armature speed; but, on the other hand, the amount of current produced, that is to say, the ampèrage, does increase, but as no accumulator is used it is only necessary to provide a lamp capable of taking the maximum amount of current generated without damage.

Owing to the large size of the armature and the constancy of the fields a sufficient current to light the bulb is produced at quite a low speed; in fact, quite a practical light is produced at about walking pace. The maximum light is given at about eight miles per hour, after which it remains constant up to almost any speed. Fig 7 illustrates the armature of the Voltalite dynamo, and shows also the neat spring collector brush which is fitted to one end of the armature spindle, and communicates with a screw at the end of the ball bearing housing (see fig. 6). This screw is mounted on a cone which is insulated from the body of the machine by a fibre ring.

Two rubber driving wheels are provided, one having a vulcanised tread of special canvas for use in wet weather in order to prevent the pulley slipping on the rim. The rubber wheels can be changed in about ten seconds, as it is only a case of slipping one off and the other on.

The only switch used in the circuit is a mechanical one, which takes the rubber wheel out of contact with the rim and so throws the Voltalite completely out of action. The device is mounted on a special gunmetal bracket (see fig. 8), which is clipped to one of the tubes of the frame. This, it will be seen, is slotted in order to allow a certain amount of latitude of position so as to get the driving pulley in the correct position relative to the wheel rim. The dynamo is carried in a bracket forming a sort of trunnion, which allows the dynamo to be swivelled to and from the wheel of the motor cycle rim, and works on the dead centre principle so that the pulley can be thrown off or on as desired. In one position a spring, clearly shown in fig. 8, holds the pulley on to the rim and in the other holds it away from it.

The head lamp and its bracket are shown in fig. 9, and although light in weight, are strongly made of brass. The mirror is of the metal parabolic type, and is practically hermetically sealed. The lamp is fitted on a stem which slides in a special clip at the back, this being of sufficient diameter to allow the bulb to be completely withdrawn when necessary, as well as to be adjusted to any desired position. Both leads are taken to binding screws fitted to a fibre disc at the back of the focussing tube. The bracket, as shown in the sketch, allows the lamp to be adjusted to any position, the locking device being exceedingly secure and providing great rigidity in spite of its simplicity.

The makers are Messrs. Ward and Goldstone, Sampson Works, Springfield Lane, Salford, Manchester; and the London agents are Messrs. the Service Co., High Holborn, W.C.

The Rip.

The Rip dynamo electric lighting set for motor cycles is quite a new introduction, and although similar in principle to the Voltalite described above, the application is somewhat different. As in the previous design, the generator is of the constant voltage type, and no battery is used. Light is therefore only obtainable when the machine is in motion. As will be seen from fig. 10, the generator in outward appearance resembles a miniature high-tension magneto, having two stout little horse-shoe magnets between the special pole-pieces on which the H section armature revolves. This latter is exactly

THE VOLTALITE GENERATOR AND HEAD LAMP.

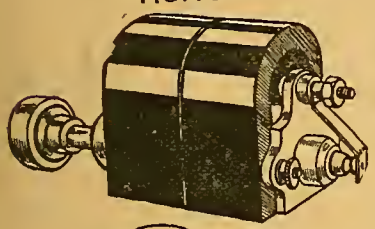
Fig. 8.—The generator clamped to its special gunmetal bracket, which is clipped to the cycle frame at a convenient point on back stay or front fork.

Fig. 9.—Head lamp and adjustable bracket.

Electric Lighting for Motor Cycles.—similar in construction to that of a high-tension magneto, except that it only has one winding, which is shown in detail in fig. 11. One end of the winding is, of course, earthed, whilst the other is carried along the armature-shaft to an insulated brush at its non-driving end. The armature-shaft revolves on plain bearings, which form the end plates of the machine, and is driven through a rubber-tyred friction disc which rolls on the beaded edge of the rear tyre rim. The position that this little dynamo occupies in working is shown in fig. 12. It may be mentioned

RIP FRICTION-DRIVEN ELECTRIC GENERATOR DEVICE.

FIG. 10



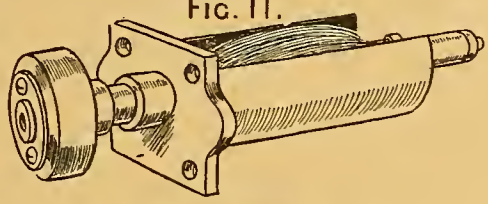


FIG. 11.

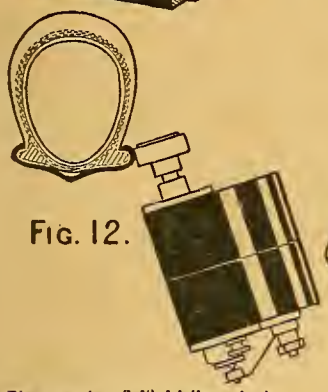

FIG. 12.

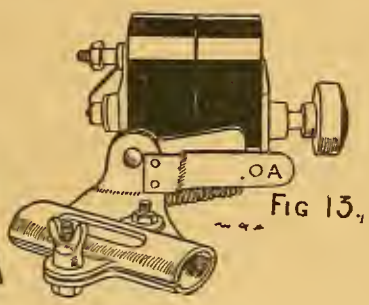

FIG 13.

Fig. 10.—Rip generator, (left) friction wheel, (right) collector brush and binding screw.
Fig. 12.—Method of driving the generator from beaded edge of tyre rim.

Fig. 11.—Single wound armature used on the Rip generator.
Fig. 13.—Bracket supporting generator normally held in engagement with the tyre rim by means of a spring. A. Spring plate carrying spigot.

that the Rip is quite a tiny little affair, its overall length being about three inches, its height and breadth about two and a half inches each, whilst its weight is only about 1 lb. For all that, its concentrated form enables it to give a very practicable supply of current.

The instrument is shown with its supporting bracket in fig. 13. This latter is clamped to one of the back stays of the frame, and supports the generator on a swivel piece, a strong spring normally holding the wheel in contact with the rim bead. To disconnect the dynamo, it is bodily swivelled on this pin until the spigot of a spring plate marked A in the sketch drops into a depression in the bracket fixed to the base of the dynamo itself, and holds the friction drive out of action. To throw it into action, the spring is released by a touch upon the plate A. Reference to fig. 10 will show how an outside collector brush is used to take the current from the insulated end of the armature-shaft to a binding screw carried in a fibre bush, the other binding screw being earthed to the body of the generator.

The head lamp supplied with the Rip is shown in fig. 14. This is, as can be seen, mounted on a spring bracket, which, however, is not likely to prove so satisfactory for motor cycle work as a rigid bracket, as there is no difficulty in obtaining bulbs which will stand quite heavy vibration. The mirror is a polished metal parabolic one, and the position of the glow lamp can be adjusted as to focus with a simple form of slide. The makers are Leo Ripault and Co., 64a, Poland Street, Oxford Street, W.

It will be gathered from the above descriptions that those who are attending to the requirements of motor cyclists in the matter of electric lighting are tackling the problem in two very different ways. The Polkey set may be described as a car lighting installation reduced to motor cycle size, while the Voltalite and the Rip may equally be described as push bicycle accessories brought up to motor cycle requirements. At the same time it must not be by any means forgotten that the difference in price between the one type and the other is very marked indeed. To our view, two points stand out very strongly. First and foremost, the difficulty of arranging the dynamo and its drive in a place where it could be protected from mud, dust, and wet. On muddy and bad roads the present arrangements scarcely allow the devices to

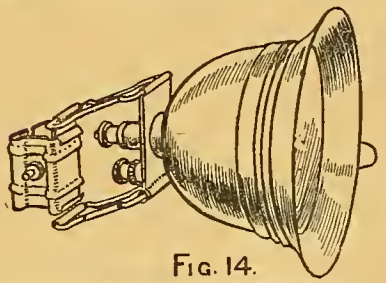

FIG. 14.

Fig. 14.—Rip head lamp and spring bracket.

demonstrate their good qualities, and I certainly think it desirable that a more perfect form of drive should be provided.

The second point is with regard to the head lamps themselves. Every means should, I think, be taken to promote the efficiency of the lamp itself, not only as regards the strength but also with regard to the illuminating power. Since the light provided by these dynamos is comparatively small, it is essential that only the best types of mirror should be used. Although the price of the two smaller sets is exceptionally low, I cannot help feeling that it might be reasonably increased without raising any objection, provided a stronger, better, and more easily cleaned head lamp were included in the set.

W. G. ASTON.

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"V.H.K." (Grimsby) desires owners' experiences of the 3½ h.p. two-speed Lincoln-Elk and sidecar.

"A.R.W.B." (Stanmore). 3¾ h.p. 1912 Scott for 14½ stone rider.

"P.H.J." (Horley). 1912 3½ h.p. T.T. Peugeot engine; also 3½ h.p. Lincoln-Elk. Strength and durability.

"H.J." (London, N.W.). 3½ h.p. Lincoln-Elk.

"H.A.N." (March).—Lomax detachable non-skid.

"H.W.H." (Bromborough).—Albion two-speed and free engine hub for 3½ h.p. touring machine.

"C.A.B." (Co. Mayo).—N.S.U. automatic carburetter, particularly with regard to consumption; 3½ h.p. single-cylinder N.S.U with sidecar.

"H.W.S." (Edinburgh).—8 h.p. No. 7 Chater-Lea, Bosch dual ignition, Senspray carburetter.

"A.C." (Begelly).—3½ h.p. 1911 Rover.

"A.V.G." (Hyde Park).—5-6 h.p. Clyno and 8 h.p. Matchless sidecars.

"R.W.M." (Whalley).—3½ h.p. Rudge 1912 model.

"O.C." (Horrabridge).—2½ and 3 h.p. Lincoln-Elk, reliability, hill-climbing.

"E.B.H." (London).—3½ h.p. two-speed Humber and sidecar.

"W.R.H." (Blackburn).—3½ h.p. Zenith-Gradua with Canoelet sidecar.

"F.W." (Walthamstow).—1911 two-stroke Scott.

"W.A.E." (Birmingham).—Gradua gear.

"A.H.C." (Bristol.) Mabon variable gear on 3½ h.p. motor cycle.

"F.G." (Hamilton).—Dot with V.S. gear.

"F.J.H." (Hull).—Electric head lamps, reliability, etc.

"E.W.H." (Hayfield).—6 h.p. Zenith-Gradua sidecar; also 3¾ h.p. Scott and sidecar.

"J.Y." (Cambuslang).—Mabon gear fitted to 3½ h.p. with and without sidecar.

"J.I.E." (Openshaw).—Albion and Mabon clutches.

Occasional Comment

By "Ixion"

Betwixt and Between.

The analysis of the quadcar and runabout market on a weight basis, published on page 138 of the issue for February 8th, shows the wild confusion at present existing in this comparatively new department of the industry. In addition to those in the list, there are several three and four-wheeled vehicles of a semi-motor cycle character in existence, and the inventors of many of them intend to manufacture on a large scale if (it is a large "if") they can procure the necessary capital. Even in the short list referred to the weights ranged from 300 lbs. (the Bedelia) to 896 lbs. (the Eric), and no two vehicles in the list are even approximately similar in design and specification. Apart from the fact that engines, ignition, and carburation have been considerably improved, we are no nearer standardisation than we were in the premature tricar boom of half a dozen years ago.

Probably a majority of the untried passenger vehicles will prove to be lacking in durability, or marred by grave faults of design, or so costly to build that their production can never be commercially remunerative. Until experience has progressed further, and design finally settles down upon well-tried lines, it would be a grave mistake to crystallize definitions, and to organise machinery for pushing a type of vehicle which may or may not prove satisfactory.

There are always a few individuals who regard themselves as inspired men of genius, and are eager to hustle evolution. Some of the lay papers up and down the country have already done a deal of harm by publishing glowing descriptions of immature designs, and informing their credulous and ignorant readers that such and such a runabout was destined to revolutionise economical motoring. I recall one particularly glaring instance. A small provincial paper was somehow persuaded to print a glowing eulogy of a certain runabout. There was in existence but a single sample of this machine, namely, the original experimental chassis—and a very bad chassis it was, though even its maker and user had no conception of its many glaring faults. The article resulted in a number of local orders, and I do not know whom to pity most—the editor, the maker, the reporter, or the men who have got delivery.

THE MOTOR CYCLE IN THE TRANSVAAL.

Scenes near Johannesburg. The inset gives an idea of the difficulties to be overcome in touring in that climate where drifts and spruits are frequently encountered. The machine is a Rudge.

Within a year or two quite a number of these vehicles may have "made good," and the time will then be ripe for a formal definition, for fresh legislation or L.G.B. orders, for a decision whether the R.A.C. or the A.C.U. shall undertake the supervision of such vehicles. In the meantime, there are several well-tried machines of the type on the market, of which the powers and reliability are sufficiently exposed.

Readers who are thirsty for light passenger outfits will do well to confine their interest to these sources of supply. It is not the tradition of sound British industry to let the buying public do the experimental work, and the maker who adopts such a tradition soon weaves a noose for his own neck.

Acceleration in the T.T. Race.

The decision to adopt the longer Manx course again will have a greater effect on the T.T. races than anyone who has not been a spectator of the 1911 events can imagine. A great deal of time is either saved or lost by each competitor on the climb up Snaefell out of Ramsey. The first stiff stretch is about two miles long, and commences with the ill-famed "Hairpin"; this stretch terminates in the other ugly bend nicknamed the "Gooseneck," above which there is almost another mile of quite steep gradient. At no point in the race are good engines so clearly differentiated from bad engines as at these two points. Both corners are sufficiently severe to slow even the best riders right down to a crawl, and the acute observer can put any engine in its proper class by noticing the smoothness and rapidity with which it gets away again after these bends.

Last year the use of variable gears complicated the question, and after watching a lap at the Hairpin I walked up some little distance beyond it. Here the men who had dropped on to low gears at the corner, in order to procure a lightning pick-up, were trying to get back to their top gears, and here again engine quality was differentiated. Some of the second-rate engines did not get going on top gear until the second or third attempt, and others "chunk-chunked" heavily for many yards, while the pick of the machines accepted top gear at the first time of asking, and shot away like cannon-balls without even a momentary baulk.

The few entrants who relied on single gears performed uncommonly well. I particularly noticed two 3½ h.p. machines of different makes, which enjoy a somewhat similar reputation on the open market. One had a variable gear, but even with this assistance to hill-climbing it was very handsomely beaten on each lap by its single-geared rival.

Mixing Sulphuric Ether in Petrol.

A CORRESPONDENT hailing from America recently suggested in these columns that a mixture of sulphuric ether and petrol is preferable, during the winter months, to ordinary petrol used alone. A friend of ours who dabbles in chemistry and kindred subjects has kindly sent us the following notes regarding this mixture, and is careful to point out that they are merely theoretical deductions, and that, as a perfect test of the advantages or disadvantages of such a mixture, the only true method is a road trial. He says: "The proportions recommended were half an ounce of ether to each gallon of petrol. Since this mixture contains less than 1% of ether, it is evident that no noticeable gain in power will result, as the power which a given fuel will produce is proportional to its calorific value (everything else being kept constant). The calorific value of ether is not high, so that the addition of 1% will hardly affect the power produced per gallon of spirit. There is one point, however, in which ether will probably score: it is exceedingly volatile, and will fire at a very low temperature, so that, by having a vapour which contains a mixture of ether and petrol, easy starting is assured. This is a very important point in the cold weather, although in summer the advantage will hardly be so self-evident. The mixture will also have a beneficial effect on the 'picking-up' qualities of the machine, on hills, etc. Sulphuric ether is usually known in England simply as 'ether.' The variety which is prepared from methylated spirit, and known as 'methylated ether,' is the cheapest form, and quite good enough for the purpose. Probably the use of 'petroleum ether' (which, chemically speaking, is not an 'ether' at all) would have a better effect than sulphuric ether, as its volatility is much higher and its flash point lower."

THE NORMAN GATEWAY AT LAUNCESTON, CORNWALL.

AN INTERESTING EXHIBIT AT SOUTH KENSINGTON MUSEUM.

IN the Science Museum at South Kensington may be seen many articles that perhaps may be looked upon as curiosities, but at the period of their existence they were considered the acme of perfection.

About fifteen years ago a motor bicycle was made and ridden by Col. H. C. L. Holden, F.R.S. It is one of the first made, has been on exhibition at the museum for a number of years as showing what the first motor bicycles were like. This motor bicycle is a four-cylinder machine with handle-bar control. All four exhaust valves lifted simultaneously. Weight, 105 lbs.

Recently an example of the latest motor bicycle has been placed on exhibition at the Museum alongside that made by Col. Holden. The machine selected by the authorities is a Rudge. Its original engine design with the radiating fins largest at the combustion head—its drop-pedal device giving a riding position comparable only to the perfect seat on horseback—free engine clutch, and easy accessibility, are some of the points that make the Rudge so distinctive.

E.

Radiator Fins on V Twin Engines.

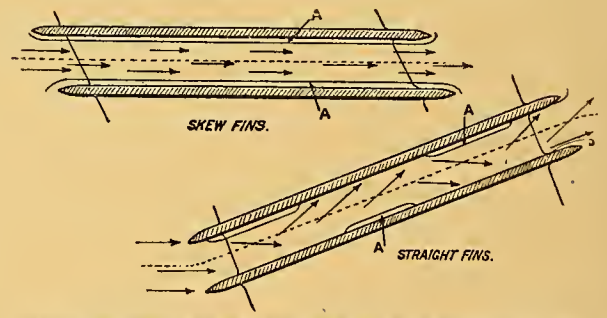
THE radiator fins on a modern V twin-cylinder are almost invariably set at an oblique angle to the axis of the cylinder. This is obviously more expensive than the older type, if only because it means that the single-cylinder castings cannot be used in a twin-cylinder of double the power. The prospective purchaser is therefore duly impressed at the mathematical precision of the maker's endeavours to obtain the maximum efficiency at whatever cost. The ostensible idea, of course, is that, by casting the fins parallel to the plane in which the engine moves, the horizontal currents of air, induced by that motion, shall have freer circulation, and so presumably carry away the heated air round the cylinder more readily, and keep the engine cooler than it would be if the older type of fins were adopted, with planes at right angles to the cylinder axis.

It would be interesting to know how far these "skew" fins are the result of actual experiment, or whether they are not rather the outcome of theory.

The Principles of Cooling.

A few elementary principles must be considered here. A heated body such as an engine cylinder gets rid of its heat in three ways—radiation, convection, and conduction. The heat felt on approaching the hand to the cylinder, when the machine is standing, is principally radiant heat, *i.e.*, rays of heat which pass through the air without materially raising its temperature. These rays are quite unaffected by a current of air, and are therefore foreign to the present discussion. Cooling by their means is precisely the same, whether the machine is moving or standing, or whether the fins are straight, skew, or New Art, provided their area is the same. Convection is the second means of cooling, and is really only a continuous form of the third means—conduction. The air in immediate contact with the cylinder is heated, and, becoming lighter, rises, its place being taken by cold air, which in its turn is heated and moves on, thus forming a steady natural current. This is how a cylinder chiefly cools, when standing with the engine stopped, as may be proved by noting the difference in the heat felt by the hand at the side and then above the cylinder, the first being the effect of radiation only, and the second both radiation and convection.

Convection and Conduction.



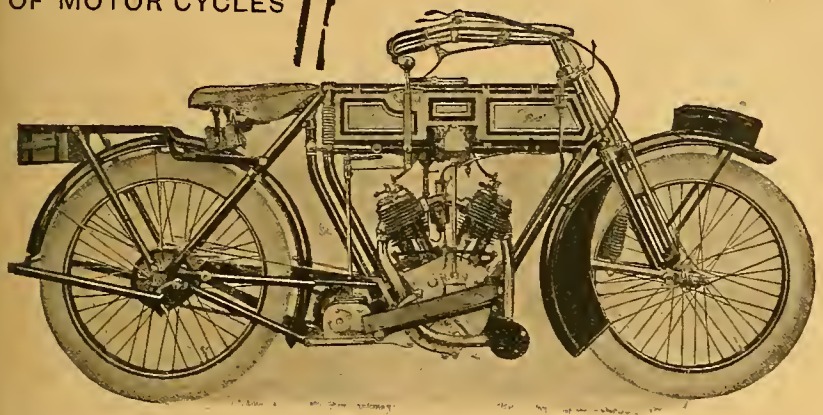
The natural currents due to convection, however, are entirely overpowered and lost in the currents set up between the radiator fins when the machine is moving, so that convection also may be disregarded in comparing the two types of fins. It may be pointed out, however, that any advantage on this score is all on the side of the straight fins. Being at an inclination to the horizontal, they assist the gentle current of heated air to rise; whereas the skew fins are at right angles to this natural current, and so retard it.

But, it will be said, since the skew fins are parallel to the currents set up by the motor cycle's motion, they will, by the same reasoning, offer less resistance to the artificial convection resulting. The same argument does not hold, as the conditions are very different. With the (relatively speaking) immensely powerful currents set up when in motion, it is an advantage to offer some opposition to their direct flow.

The reason is simple. Air is a very bad conductor. Therefore, only a very thin layer of air in immediate contact with the area of the cylinder and its fins is heated at all; and were it not for the convection currents, or the artificial currents we are now considering, would remain like a blanket round the heated cylinder, preventing it from cooling. What happens, however, in practice is that this strong artificial current sweeps away the thin layer of heated air, and brings a continuous stream of cold air into contact with the heated metal, carrying away its superfluous heat.

Which is the Better.

The whole crux of the question is whether the straight or skew fins the better help this action. A reference to the diagram would go to show that the slight opposition offered by the straight fins is a real advantage, and though it is possible they very slightly retard the currents, the difference in time during which any given particle of air is in contact with the hot metal is too infinitesimal to have any effect. The diagram shows a pair of skew fins and a pair of straight fins. Round each is depicted a (much exaggerated) thin layer of heated air, A. A current of cold air of relatively high speed is coming in the direction



Note how the layers of hot air A over which (the writer points out) the cold air glides in one case, and how they are broken up in the lower diagram.

of the arrows. In the one case this current flows straight through between the two fins, and, it is obvious, never comes directly in contact with the heated metal. Of course the heated air, being light is swept away in its train, but the action is weak. With straight fins, the current, travelling horizontally, impinges on the layer of hot air on the lower flange, and bores its way right through to the metal. Further, it will be reflected thence on to the upper flange, where it will have the same effect. Moreover, the general course of the current resulting will be as shown by the dotted lines, and hence, in addition to the direct action of the horizontal components, there is the same general effect as with skew fins. It is sufficiently obvious, then, that on this reasoning the straight fins should be the more efficient.

Of course, it is possible actual experiments may have been made which have satisfied makers that skew fins are really something more than a talking point. If so, they will probably let us know the fact; but, if not, it is more than likely that in practice there is no perceptible difference in efficiency between the two types, whatever may be argued theoretically. And therefore the straight fins are to be preferred, if only on the score of workshop convenience. H.R.T.

THE PULLMAN CAR OF MOTOR CYCLES

Bat is Best

New Catalogue awaits your request.

(This we say in no boastful spirit: we merely repeat what is being affirmed by all Bat riders).

Take this twin-cylinder, two-speed model. It embodies the best ideas in motor cycle construction, realised in the best material, by best workmanship. Its applications in use are many. As a solo mount it can be driven at a crawl through traffic and interesting country, or it may be speeded up to a pace that equals records. United with a sidecar, it affords an exceptionally efficient passenger combination, capable of anything yet accomplished on the road. It will give willingly and untiringly the best service, for

The BAT MOTOR MANFG. CO., PENGE, S.E.

3½ h.p. ROVER

"The Daily Mail," February 2, 1912,

says

"IDEAL MOTOR CYCLE."

"Here, surely, is as near the ideal for its type as one can expect motor cycle manufacturers to produce.

It is in perfection of detail that this machine makes so rare an appeal.

Never have I ridden a machine of this type which was genuinely quieter under all conditions of driving.

This engine proves a veritable delight in its instant responsiveness.

The workmanship is obviously of the very best."

1912 Models from £49.

THE ROVER CO., LTD.,

COVENTRY.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

How to Exhibit a Badge.

Sir,—I see your correspondent "P" suggests the front number plate is the best position for exhibiting the A.A. badge. This I suggest is quite wrong, and is borne out by a conversation with one of the A.A. scouts, which I had at Ascot last summer. Having stopped to enquire the way, the conversation turned on badge position. I was then carrying mine well up on the handle-bar and facing the direction of travel. The scout remarked that he wished all motor cyclists would do the same, as when the badge is on the number plate it is impossible to see it until the rider is opposite the scout. He said carrying the badge in the position I had it made it visible some distance away.

J. R. BELCHER.

Cooling the Exhaust Valve.

Sir,—I notice in your issue of February 8th, a report of a meeting of the A.C.U. at which a paper was read entitled "Speed and Power," and one of the devices shown was intended to force cold air on to the exhaust valve for cooling the engine.

I beg to call your attention to the fact that I hold a patent, No. 25533, 1909, for cooling internal combustion engines by admitting cold air to the exhaust valve. I shall be glad if you will give this the same publicity that you have given to the meeting of the A.C.U. F. B. WELLS.

[Devices for cooling the exhaust valves of internal combustion engines in a somewhat similar manner to those mentioned have been patented by several, notably by Mr. Harry Reed, Manchester.—ED.]

The All-weather Motor Cycle.

Sir,—I am sending two photographs of myself riding my 3½ h.p. 1910 Bradbury motor cycle on my way to business through very deep snow, which fell at Leeds early this month, Although I found it extremely difficult to keep upright, my engine never failed me until I was about twenty yards from my place of business, when the back wheel, as can be seen, got completely clogged up going through a very deep snowdrift.

E. M. GLEN.

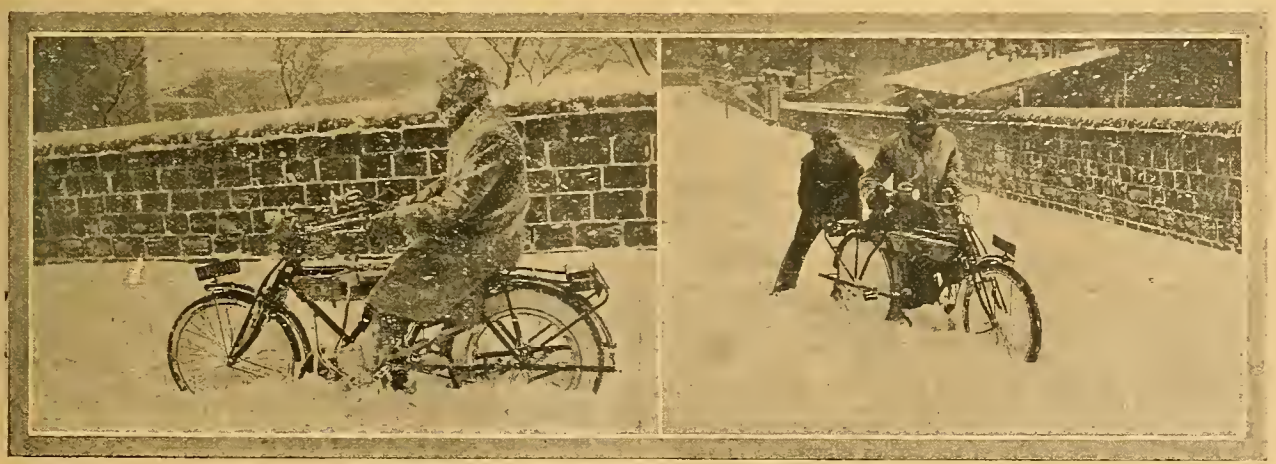
Who will Adopt the Quadcar?

Sir,—I am quite in accord with your leaderette of the 8th inst., "Who will adopt the Quadcar?" There is no doubt that a large market awaits this type of vehicle. The suggestion that makers should submit their machines to an R.A.C. trial is a good one. I see no reason why a properly designed and built quadcar should not be quite as reliable as a sidecar combination.

Seven years ago I designed and built a light car on what is now described as "up to date lines," and I should certainly have no hesitation in submitting a similar one to such a test, the original machine having passed out of my hands. Had I the capital at my command now I should certainly place it on the market. B.J. 305.

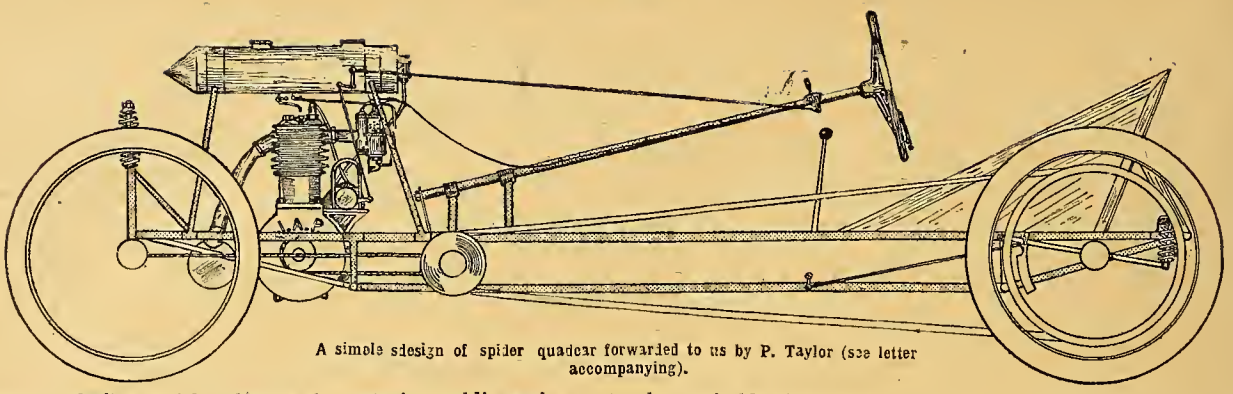
The Proposed R.A.C. Road Guides. Attitude of the A.A. and M.U.

Sir,—The following letter has been addressed to the secretary of the Royal Automobile Club:



12th February, 1912.

Sir,—I am directed by my committee to communicate with you in regard to the scheme for the establishment by the Royal Automobile Club of a system of road "guides" in uniform, the details of which have been published.



It is unnecessary to point out that the duties which it is stated these road "guides" will perform are identical with those which have been carried out for the past seven years by the patrols of this association, at a cost at the present time of over £20,000 per annum.

It is difficult to believe that your club seriously contemplates the adoption of a scheme, which is not only an encroachment upon work to which this Association has been devoted since its inception, but which will also, if persisted in, lead to unnecessary overlapping, to the detriment of the reasonable motorist whose welfare should be our common concern.

The unanimous approval which greeted the amalgamation between the Automobile Association and Motor Union (which now numbers over 39,000 members) is evidence of

Motor cycling in the snow. (See letter signed E. M. Glen on this page.)

A simple design of spider quadcar forwarded to us by P. Taylor (see letter accompanying).

the strong feeling which animates the motoring public against unnecessary duplication of work. Any action which would tend to a recurrence of friction and lack of unity between the national motoring institutions cannot be too strongly deprecated.

My committee hope that the General Committee of the Royal Automobile Club will pause before embarking upon a policy which can only be construed into an act of aggression directed against a friendly organisation.

STENSON COOKE, Secretary A.A. and M.U.

Sir,—Reference has been made in the press to "The Coming Fight between the Royal Automobile Club and the Automobile Association."

The real position is as follows: For years the Automobile Association has been in the habit of rendering its members certain assistance on the road, and this assistance has been carefully confined to its members.

The members and associates of the Royal Automobile Club, numbering over 25,000, have asked that similar assistance should be rendered to them by their own organisation, and this assistance it is now proposed to give to the members and associates of the Royal Automobile Club

The club does not propose in any way to interfere between the Automobile Association and its members, and sees no reason why the Automobile Association should interfere between the club and its members.

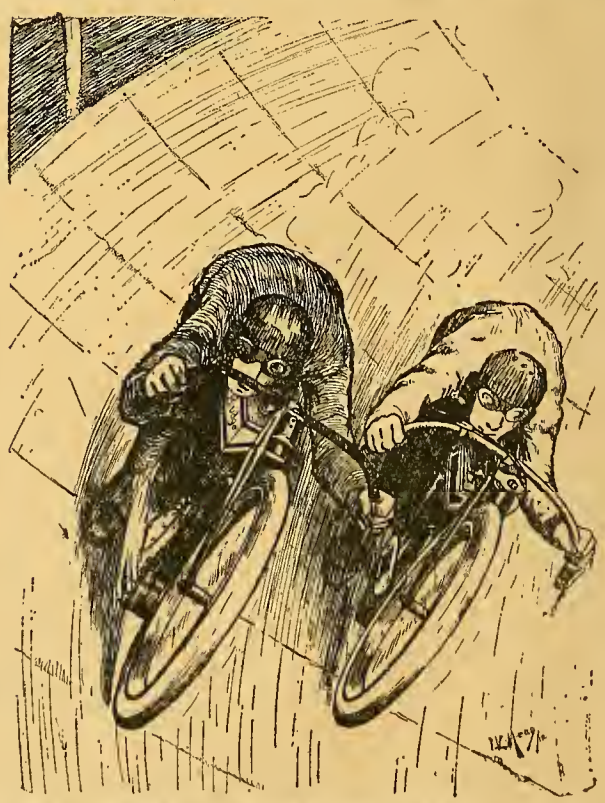
This position presents no materials for a "fight," each body being entirely free to render such assistance to its own members as it sees fit.

J. W. ORDE.
Secretary Royal Automobile Club.

Stream-line Bodies for Motor Cycles.

Sir,—Perhaps a short account of a personal experience last winter may be of interest to any of your readers who may contemplate "stream-line" bodies on their motor cycles.

The motor cycle I used had an open frame, and therefore offered unusual facilities. A flat shield was fitted something after the nature of a car dashboard, reaching as high as the seat and slanting upwards and backwards just in front of the rider's legs, as this was found to give the maximum of warmth and protection. It was speedily found necessary to attach side pieces for the protection of the outside of one's trousers and boots. Incidentally, I found that if the roads were in the least dry dust flew up the slanting dashboard, covering the rider's front and face to a most astonishing degree. The great disadvantage experienced, however, was the feeling of insecurity from being boxed in. The degree of warmth and protection was such that I persevered, nevertheless. One day, on turning a corner at the top of a hill, I was met by a gust of wind, which, catching the shield, for a moment made steering to my right side a bit difficult and erratic. Before I had regained complete control, a car appeared round the corner, coming fairly fast. A collision resulted. Usually, in such a case, the motor cyclist is thrown clear; and this would have occurred in my case but for the shield, which, crumpling up, pinned me helpless to the machine. The clever driving of the car alone saved my life, and I escaped with a badly crushed foot.



I have no hesitation in saying that on a two-wheeled motor cycle anything in the nature of the bodies illustrated in your recent article, and referred to by "Ixion" in his note, would be veritable death-traps for all but the most expert. I cannot see that there is any way out of the difficulty "Ixion" mentions, save first to adopt the three or four-wheeled machine, which is stable of itself, and then to fit the stream-line body.

H.M.

A Simple Form of Quadcar.

Sir,—I am submitting to your notice a design for a light four-wheeled runabout which may be of interest to your readers. No, my name is *not* "Dew," although I am indebted to him (through the medium of your esteemed journal) for what the artists calls the "altogether." I I think the drawing will explain itself. The details differ from those of Mr. Dew, and are mostly original.

The engine is a standard 3½ h.p. J.A.P., and this, in conjunction with a counter-shaft clutch and two-speed gear, should prove an ideal propulsion for a sporting "go anywhere" type of mount. The one illustrated should present little difficulty in upkeep over and above that of a motor cycle. I may say that the drawing is not a lesson in draughtsmanship, and I hope your readers will overlook

NECK AND NECK! A motor cycle racing incident. The artist has endeavoured to depict (and we must say with considerable success) a Triumph and a Rudge rider in a great duel.

technical errors. I have had an offer by a leading cycle and motor cycle man in the district (Keighley) to construct a runabout on the lines illustrated for £50 complete, which I consider very reasonable. Wishing your valuable paper a continuation of the success it has deservedly attained,

P. TAYLOR.

Sheffield and Hallamshire M.C.C. and Affiliation.

Sir,—In reading the account of the Sheffield and Hallamshire Club's general meeting in Club News of last week's issue, I note that it is stated that this club has affiliated to the A.A. and M.U. As a member of this club, and one who was present at this meeting, I suggest that the writer has no authority in making the statement, as the club did not affiliate to the above body. J. HASLAM.

[It appears that a proposal to affiliate to the A.C.U. was defeated, and an offer of free legal defence of the members accepted from the A.A. and M.U.—ED.]

Necessity is the Mother of Invention.

Sir,—On page 173 of the last issue, under the above heading, you report how a motor cyclist thawed the generator of his lamp over a petrol fire which he made on the road. This method, to my mind, is waste of good petrol, and an addition to a bad tax—the petrol tax.

Three of us here (Royston) had similar trouble with our generators one evening when we went skating. When we were returning, we found that the generators were frozen hard, and we adopted a very simple method. First we unscrewed our carbide containers, and filled the remaining space available above the carbide with snow, which we collected from the side of the road. We then spat on the snow and replaced our containers as soon as possible. The saliva started the formation of gas and heat, the heat in its turn dissolved the snow, which produced more gas and heat, and the heat from this melted the ice in the water compartments.

When once we got a good flame it would have been an easy matter, had the heat not thawed the ice, to remove the burner and play the flame on the container for a few minutes. Of course, I mean, when I say remove the burner, that the burner is easily removed with its seating, as is the case in the excellent F.R.S. lamp.

Wishing *The Motor Cycle* every success, which it richly deserves. (Dr.) SELBY CLARE.

Inclined Engines.

Sir,—In reply to "Ixion's" remarks on the subject of engines inclined backwards, I should like to say that my omission was deliberate. Having set out to state the case for a departure from the usual vertical engine, I failed completely to discover either by reasoning or experience any notable advantages in the inclined-backwards construction. Now, however, Mr. W. H. Wells has stepped into the breach and made good my deficiency. Therefore, further comment from me on that branch of the subject would be supererogatory.

In referring to the Scott machine, Mr. Samson asserts that its steadiness is due, not as I suggested, in part to a forward position of the centre of gravity, but, on the contrary, to a backward position of the load. Mr. Samson implies that there is more weight on the back wheel and less on the front wheel of a Scott machine than on most other makes. Now this flat contradiction comes as rather a shock, because it is customary to study facts and figures before making such assertions as the above. I will presently quote figures which seem to indicate that Mr. Samson has not done so.

I agree that much depends upon the ability or otherwise of the rider, but should like to point out that it is very often otherwise. Does Mr. Samson build his machines for men of Mr. J. Marsball's calibre? To do so is not a commercial proposition. It is for ordinary unskilful amateurs like myself who go to hill-climbs and races but do not go in for them that machines are turned out by the thousand.

I should like to refer again to my experience along the Holyhead Road, over the best limestone butter. The machine I described was, of course, a P. and M., the weight distribution of which is the most remarkable, and also the most satisfactory from the said amateur's point of view of any of the three types quoted below.

Assuming the load on the back wheel to be unity, I give the proportionate load on the front wheel in three cases. It is best to put it that way because weights like ages—time and gravity are merciless, blind, undiscriminating—are often better unrevealed. The first case is, of course, a criterion for a large number of standard machines at present on the market, and the result is obtained from measurement. The results in the second and third cases are from figures supplied by the makers: Free engine Triumph, .76; Scott, .79; P. and M., .96.

Convention demands that I should state the unfortunate fact that I have no financial interest in the three firms mentioned.

B.Sc.

Lubrication Systems.

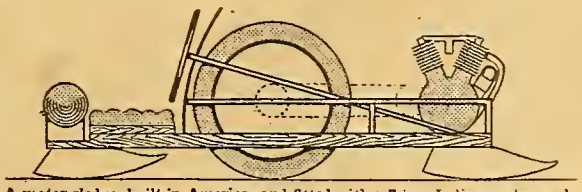
Sir,—I think most readers will agree with the opinions expressed that ball bearings, inside flywheels, oil drag, excessive cylinder lubrication, carbon deposit and rapid bearing wear are serious objections to the modern engine, and that the various methods suggested for overcoming these, such as the outside flywheel and plain bearings, have objections from other points of view. As an engineer especially interested in internal combustion engines, there appears to me to be only one satisfactory method of getting over these difficulties, that is by adopting forced lubrication. In this case the flywheel does not drag in the oil, lubrication of the cylinder depends on oil pressure, and can be regulated; there is no bearing wear and no necessity for an outside flywheel.

In writing this, I have in mind the W.D. engine, which was described in your paper at the time of the Olympia Show. With an engine designed as cleanly as this one, it appears to me that there is not even a single compensating disadvantage, as the complication involved is less than with many of the mechanical lubricators now on the market, which are at best only a slight improvement upon the old-fashioned hand pump.

R. H. DOWNS.

To the Tyrol and Back.

Sir,—"R.M.B.J." takes me somewhat to task for execrating the road from Domo d'Ossola up the Simplon Pass, in my article "To the Tyrol and Back." I only gave my impression of the road, and it may be a guide when I say that in 1901 there was a landslide that swept away châlets, a forest, and covered an area twice the size of Hyde Park with *débris*, burying the road 30ft., and a detour is now made to go round this area. It was perhaps here that I was thrown on a road resembling a quarry bottom; in fact, "R.M.B.J." says "there are large stretches of unrolled stones." Quite so; and this on a climb of over twenty miles. Is it not a fact that "R.M.B.J." came down the worst side, and, therefore, was not so inconvenienced?



As to a steam roller, I may say we only saw two during the whole of our tour, but then a steam roller is not necessary to make a road smooth. The Simplon rises to a mere 6,600ft., and is a disgrace, whereas the Stelvio rises to over 9,000ft. and the surface has the Simplon "chased up a back street."

"R.M.B.J." asks me if I would not have liked a two-speed, putting aside the sport in a single gear, and in answer I may say he has asked me a puzzler, as the answer is yes, and yet no, because there were a few times only when I could have done with a lower gear ratio than the boss in the J.A.P. will allow; but, in any case, I should not have relished a twenty-miles grind on a machine geared 4½ and 9 to 1. If I was going exactly the same tour again and had to have a two-speed, I should choose a gear giving 4¼ and 6¼ to 1, or one that will give any reasonable gear, say the Gradua.

However, what my machine is to be, single or two-speed on my next tour, is "on the knees of the gods."

W. FAWCETT.

S.I.A.M.T., Ltd., write that they wish to correct the impression that has gained ground that the machine entered in the Herts County A.C. Trial was a 2½ h.p. The machine was fitted with the standard 2¼ h.p. engine, and was single-geared.

A motor sledge, built in America, and fitted with a 7 h.p. Indian motor cycle engine. The wheel steering will be noted. (See page 173 last week.)

TIME TO LIGHT LAMPS.

Feb. 22nd	... ...	6.23 p.m.

,, 28th	... ...	6.34 ,,

English-Dutch Trial.

Further news respecting the above international trial will be published in our next issue.

Oxford Club's Programme.

For the annual open hill-climb of the Oxford M.C.C. on April 13th, a class for sidecar combinations and runabouts will be included. A further event proposed by the Oxford M.C.C. is an open speed trial in a private park, also a 100 miles open reliability trial over an extremely difficult course.

Hill-climb in New Zealand.

A hill-climb organised by the Otago M.C.C. (New Zealand) at Saddle Hill proved a great success, the class winners being as under:

Private Owners.—A. MacDougall (3½ h.p. Triumph)

Trade Riders.—G. Paterson (2¾ h.p. T.T. New Hudson).

Sealed Handicap.—Private Owners: S. Poole (5 h.p. Indian).

Ladies' Competition and Easter Tour to Harrogate.

Particulars of the second lady motor cyclists' trial organised by the Herts County A.C. are now ready, and may be obtained from Mrs. C. C. Cooke, North Mimms, Hatfield. The run to Harrogate is on Good Friday. On the Saturday there is to be an open hill-climb at Barden Moor, and for the North v. South contest Messrs. Phelon and Moore, Ltd., have presented a challenge cup. Easter Monday marks the termination of the tour, when the return journey to London will be commenced.

Twenty-nine T.T. Entries.

Entries to date for the Tourist Trophy Races are as under:

SENIOR.

O. C. Godfrey (holder)	Hal Hill
C. R. Collier	E. T. Bolton
H. A. Collier	J. Norton
S. A. M. Witham	P. Brewster
Blumfield, Ltd. (3 machines)	Scott Engineering Co. (2 machines)
John Gibson	J. W. Woodhouse
W. H. Bashall	I. B. Hart-Davies

New Company to Manufacture Quadcars.

In a recent issue we referred to a company which was in process of formation to manufacture quadcars. The prospectus is now in the hands of the public, and the subscription list will be closed on Monday next, the 26th inst. The title of the concern is Duo-cars, Ltd., the authorised capital being £10,000. Prospectuses and further information may be obtained from the secretary (*pro tem.*), Mr. W. H. Stirling, 114-121, Mansion House Chambers, 11, Queen Victoria Street, E.C.

Arms Hill an Attraction.

Another party of motor cyclists journeyed from town to Arms Hill, near Henley, at the week-end, and on arrival there found quite a number of motor cyclists actively engaged in trying to conquer the ascent. Any other readers wishful to try their prowess should refer to *The Motor Cycle* of February 1st last, wherein the first mention of the hill was made, and a map published showing its location. We have received a communication claiming that the first ascent on a fixed geared 500 c.c. single-cylinder was made by a Mr. Shaw on a T.T. Rudge. The first ascent on a variably-geared 500 c.c. is claimed by C. Q. Roberts on a three-speed Rover.

Midland Open Reliability Trial.
New Western Artery for London.
A Morning with the Testers.
Will Makers Support the T.T.?

Stolen Machines.

Burglars succeeded in purloining a motor cycle from a lock up shed at Richmond a few nights ago. The stolen mount is a 2½ h.p. 1912 N.S.U., engine number 19394, registration mark LE 977. The owner, Mr. R. S. Ingram, "Strathearne." King's Road, Richmond, offers a reward of £5.

Motor cycle and sidecar, the property of Mr. W. Wilson, Tottenham. 4¼ h.p. Precision, No. 1462, Eisemann. Druids, Binks carburetter, Wood Milne back, Michelin front, wicker sidecar.

The premises of the Colmore Depot, 49, John Bright Street, Birmingham, were broken into between last Saturday night and Monday morning, and two motor cycles stolen—one 1911 two-speed Douglas, registered No. O 4537, the other Macheth-Precision, Armstrong three speeds, two pairs footrests, no pedals, registered No. O 7411. Two suits of motor clothing were also taken, one belonging to C. R. Collier, which he left after the Midland Trial.

FAST CORNERING IN THE GREASE.

Four competitors in the Midland Trial, at the bad bend on Sunrising Hill. W. W. Douglas (Douglas), C. H. Walden (Premier), S. Fontaine (Quadrant), and J. Chater Lea (Chater Lea sidecar.) A less fortunate competitor is looking on disconsolately.

Thursday March 21st

The date of *The Motor Cycle* Special Spring Number

Motor Cyclists' Progressive Association.

The meeting of the newly-formed Motor Cyclists' Progressive Association is *to-night*, Thursday, at the Holborn Restaurant, at 7.30. All members of the A.C.U. and its affiliated clubs will be welcome.

Owners' Experience.

A sign of the times is the increase in the number of "Experiences Wanted" in this issue The queries are sent by readers anxious to place orders for the motor cycles and accessories enumerated, subject, of course, to favourable reports by fellow readers of this journal.

Sunderland Motor Cyclist gets Damages.

W. F. Ranshaw, a motor cyclist of Sunderland, has been successful in a claim for damages against a firm of market gardeners owing to the negligent driving of a trolley, which did not allow sufficient room for the motor cycle to pass.

Illuminated Speed Limit Signs.

The R.A.C. and the A.A. and M.U. representatives met the Hants C.C. with regard to the proposed speed limit in Basingstoke. After an inspection of the roads it was agreed to waive all objection on the local authority agreeing to supplement the ordinary speed limit signs with special illuminated signs, so that motorists should have adequate warning of the existence of the restriction at night.

A Monster Motor.

Ceurremans the well-known Belgian pacemaker, is at present in Paris superintending the building of what promises to be the largest motor cycle ever used for pacing purposes. It is to have four cylinders, and when complete, Ceurremans with Arthur Vanderstuyft following in his trail, will endeavour to wipe out Paul Guignard's long standing paced push cycle world's hour record of 63 miles 256 yards set up at Munich a few years ago.

A Misstatement.

Misguided people often step in where angels fear to tread. The rumour contradicted in our last issue that Jake de Rosier would ride a Matchless in the T.T. Race was a feat of sublime imagination. Poor de Rosier is suffering from the effects of an accident that occurred in the autumn, and, so we are informed, his doctor has advised him to refrain from riding for some time to come. Consequently he has, since his recovery, occupied himself with track promoting.

Motor Cycle Paced Racing at Home.

Motor cycle paced racing promises to form one of the popular attractions at cycle race meetings during the coming season. Several well-known riders have purchased motor cycles for pacing purposes, for their own private use, and it is very probable that a four-cornered paced match will figure in the S.C.C.U. programme at Herne Hill on Good Friday. Now that motor cycles are so plentiful, one wonders why this form of interesting racing has not been more encouraged. It has great possibilities.

FUTURE EVENTS

The Late Mr. D. G. Gilmour.

On Saturday last England lost one of her most daring and skilful aviators, who sacrificed his life to the cause of science. Douglas Graham Gilmour was known intimately to the writer, who knew him to be one of those intrepid Englishmen of whom his country may be justly proud. Very many of his friends blamed Gilmour for his rashness, but though his doings on motor bicycle, car, and aeroplane were of the hair-raising order, his extraordinary skill led those who knew him better to criticise him more kindly. Apparently the terrible accident which removed him from our midst was in no way his fault. It was in 1907 that he rode through the Six Days' Trials on a 9 h.p. twin Bat, 85 × 95 mm., and with it gained a first-class certificate. That large engine was thought to be a terrible monstrosity in those days. Yet Gilmour would make it start at the first push, and would walk in a circle beside it, with each cylinder firing with perfect regularity. He was intensely amusing, and well does the writer remember how, on the occasion of these trials, there happened to him one of those thrilling incidents which he so dearly loved. "I was going quietly through a village when a stupid old horse in a cart started to run away. Of course, I chased it and passed it easily, and then a police inspector stopped me and said it was my fault. Silly ass! I can tell you I told him what I thought of him." Some years after, Mr. George Reynolds, who had been a judge in the 1907 trials, was walking across the Brooklands flying ground, above which Gilmour was soaring in a monoplane. He never forgot his old motor cycle friends, and, swooping over Reynolds like a hawk, scared the life out of him. Hardly had Reynolds recovered from his trepidation when a cheery voice called out, "Hallo! Reynolds. I thought I recognised you just now. Sorry I came so close, but I had to make sure it was you." None of those splendid sportsmen whose doings have been recorded in *The Motor Cycle* will be regretted more than our old friend, whose name has been added to the too long list of those whom aviation has claimed for her own.

The R.I.A. in Surrey.

The East Surrey Centre of the R.I.A. is taking a very active interest in the scheme for the construction of the relief road at Croydon. At its last meeting, the chairman (Councillor A. T. Lewis) made a special report thereon. The Corporation are now completing surveys and plans of the complete road (Thornton Heath to Purley), the total cost of which the borough surveyor estimates at £60,000. Towards this the Road Board have definitely agreed to contribute £30,000, the Ecclesiastical Commissioners £5,500 and provide the necessary land and compensate the present owners, and the L.B. and S.C. Railway Company have agreed to provide new bridges at Waddon and Mitcham Road Crossings. A scheme for widening the Shalford to Reigate Road was discussed and further details are to be obtained, and the matter will be further considered at the next meeting.

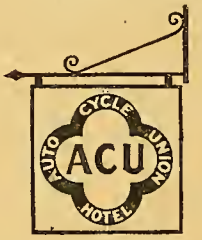
The late D. Graham Gilmour, a one time motor cyclist, who was killed in a monoplane accident at Richmond last Saturday. He personally gave us the above photograph.

AUTO CYCLE UNION NOTES.

MEMBERSHIP.—Seventy-two touring members and seven private members were elected at the last committee meeting. The 5s. touring membership scheme is going well, and enables motor cyclists to obtain valuable benefits at a smaller subscription than any other motoring institution demands.

NOTTINGHAM CENTRE.—We are given to understand that a Nottingham Centre is in process of formation.

NATIONAL AUTOMOBILE COUNCIL.—The National Automobile Council on which the A.C.U. is represented is fortunate in having the Right Hon. Walter Long as chairman.



JUDGES IN A.C.U. TRIALS.—The names of a number of members from which the A.C.U. may make a selection of judges for A.C.U. competitions is to be submitted to the Manufacturers' Union.

SUB-COMMITTEE TO CONSIDER TOURIST TROPHY REGULATIONS.—The above consists of Mr. J. R. Nisbet, vice-chairman, Messrs. J. W. G. Brooker, A. J. Moorhouse, and E. M. P. Boileau.

QUADCARS.—The A.C.U. Competitions Sub-committee and the R.A.C. Competitions Committee met and discussed the question of the control of the above vehicles last Thursday, but nothing definite was decided. A further joint meeting will be held this evening.

A sub-committee consisting of Messrs. Victor Hart, H. P. E. Harding, M. G. Duncan, Otto Thomas, C. A. Smith, J. W. G. Brooker, and F. A. Hardy met recently to discuss the question of representation upon the A.C.U. General Committee, and it was unanimously recommended that, in order to give every affiliated club an equal voice in the control of affairs, a revised system of election of club representatives should be instituted in accordance with the following scheme: (1.) At least twenty-eight days prior to the annual general meeting the secretary shall issue requests in writing to all affiliated clubs to nominate individuals for representation on the General Committee to the number of the agreed club representation. Such nominations must be received from the clubs not less than fourteen days prior to the annual general meeting. Thereupon the nominations shall be printed on a voting paper and circulated to the clubs, who shall return them completed to the A.C.U not later than three days prior to the annual general meeting. (2.) Such ballot paper shall contain the names and towns of residence of the individuals nominated, together with the name of the club of which the nominee is a member, and the names of the club or clubs nominating him. (3.) The result of the voting shall be reported by the secretary at the annual general meeting of the council, and the stipulated number receiving the largest number of votes will then be qualified to serve on the General Committee.

ONE-DAY SPRING TRIAL.—The above event will be held on Saturday, March 2nd, starting from the Swan and Sugarloaf Hotel, Croydon, at 8.30 a.m. The course will extend over about 160 miles in a southerly direction, the luncheon stopping place being at Tunbridge Wells. Motor cyclists who are willing to act as honorary observers along the route between Croydon and Tunbridge Wells are invited to send their names to the secretary, the A.C.U., R.A.C. Buildings, Pall Mall, S.W.

The new Auto Cycle Union sign to be exhibited outside recommended hotels for motor cyclists.

Will Makers Support the T.T.?

THE above question is being asked by almost everyone interested in the T.T. races, to be held in the Isle of Man on Friday, June 28th, and Monday, July 1st. Every motor cyclist knows that practically the whole of the trade have signed a bond which places them under a heavy penalty if they directly or indirectly support the races. Naturally, a bond becomes null and void if the signatories agree that it shall be cancelled, and the question now arises will the Manufacturers' Union, in view of public opinion, waive the bond or allow it to run its course? At the time of writing no one can say definitely what the trade decision will be, but a meeting which was to take place after these pages had gone to press would decide the matter, and we know which way the wind was blowing.

Considerable indignation was caused among Manxmen, motor cyclists, and, in fact, certain manufacturers, members of the trade union, by the letter sent to the Manx Highway Board, urging it to refuse to grant permission for the T.T. races to be held this year on the grounds of danger, etc. It now transpires that the communication was not sanctioned by the motor cycle section of the Manufacturers' Union at all, and that the members of that section do not recognise the document

Naturally this letter has been interpreted by motor cyclists to mean that motor cycle manufacturers are opposed to sporting events.

The makers' contention is that they have done nothing to discourage sport; their view is that they have endeavoured to prevent a professional race, and had the Auto Cycle Union been willing to confine the race to amateur riders they (the manufacturers) would have done nothing to interfere with the contest in any way. The A.C.U. did not see eye to eye with the makers, and decided to hold an open event which according to the makers has altered the circumstances, and the Tourist Trophy Race bond now requires some further consideration. We are informed there is no lack of cohesion among the makers, but the altered conditions justify them in reconsidering the question. We think the real situation is that the Manufacturers' Union thought that without their support the A.C.U. would abandon the races, or they would at least confine them to amateur riders, which was the desire of the makers. The A.C.U. have, however, gone ahead, obtained the necessary permission to use the Isle of Man roads, already secured a fairly important entry, and the opinion now is among a number of makers that they cannot afford to be left out. We should not be surprised if the "bond" were thrown to the wind.

A SUGGESTED SILENCER.

THE primitive form of silencer is a straight pipe of uniform bore. A step toward efficiency is made by perforating this. The series of holes, by which a portion of the escaping gas is released, lessens the pressure and volume, thus reducing the impact occurring at the main outlet. No coercion is, however, brought to bear; as much of the gas escapes as pleases. Now I propose to force the escape by pressing in the side of each perforation furthest from the valve. By this means the holes become a series of scoops, and that a good percentage of gas shall escape becomes a point assured. By making the pipe of diminishing bore—of course increasing the number of perforations in ratio to increasing pressure—this point is further assured. The coiling of the pipe is a natural outcome of the cumbrousness of an efficient length of pipe.

The point aimed at in evolving what might be styled "The Snake Silencer" is a combination of the above essentials in a form neat, readily assembled, and cheaply manufactured.

This it is proposed to do by making it in two portions, an outer and an inner, each to be a hollow cone—the former bearing the impress of a convex spiral, constantly diminishing on its outer surface; the latter a concavity to match; the pair forming, with the latter wedged within the former, a continuous duct joined at its interstices by a double sheet, or sheet-like, connection of metal, an integral part of the whole.

The material used might be copper, brass, or aluminium spun, or pressed, or both; or iron, cast or pressed. The efficiency being in no way impaired so long as the form were retained, the material and method would be of no importance, and would be decided by economy. Spun and pressed aluminium would be, probably, found most satisfactory.

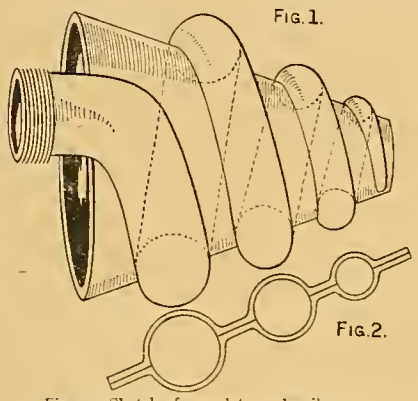
In the accompanying sketches I have attempted to illustrate the complete contrivance. The inner portion is the complement of the outer.

The joint between silencer and exhaust pipe would be made to suit exigencies The pipe might be tapered off, wedged in, and secured by a pin and two nuts; or, better still, a permanent union could be affixed to the silencer. Neither method would involve any difficulty.

Except for the initial cost of plant, which need be by no means great, the whole process would be inexpensive.

Two alternatives offer regarding the position of the perforations, which might consist of one or more rows, the total area exceeding that of the entrance to the silencer. If on the outside, the escape will be in all directions. Perforated on the inside, with the small end of the cone sealed, the gases would be ejected at the large end in a uniform direction. No cut-out would be required.

H. A. ROGERS.



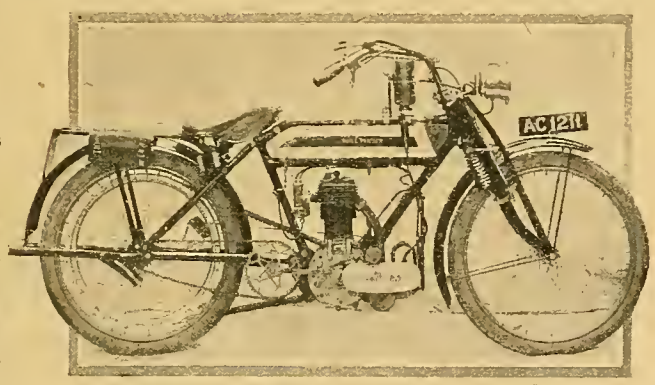


Fig. 1.—Sketch of complete snake silencer.
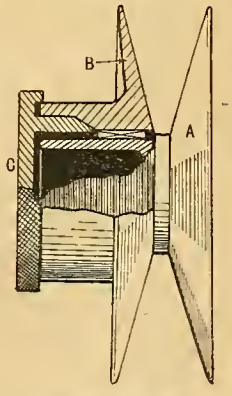
Fig. 2.—Section of one side of cone showing method of putting together—
The perforations which may be inside or outside are not shown.

THE NOBLE-PRECISION.

Herewith we illustrate a new motor cycle built by Alfred Noble and Co., Stoneleigh Works, Hill Street, Coventry. The machine is on standard lines, being fitted with Druid forks, dropped top tube, and the Precision engine unit. Great attention has been paid to the detail work on this machine, and it has obviously been constructed by a practical rider. It is noticeable, for instance, that the petrol and oil pipes are carefully annealed and left unplated. The stand and carrier are particularly substantial. 2in. Davidson filler caps are used on the tank, while the lubrication is by the Best and Lloyd semi-automatic system.

A specimen of the 3½ h.p. Noble with Precision engine.

The bottom bracket is formed so as to make the attachment of a counter-shaft gear a simple matter should it be desired—that is, by undoing two nuts and removing the pedalling gear.



The standard machine is fitted with Dunlop 26in. × 2½in. tyres and 1in. Midland belt. The handle-bars are very comfortable and are bent in a pleasing sweep, the ends being well dropped so as to give a natural position to the rider's wrists. Both front and rear mudguards are of unusual width. Altogether the machine has a smart and workmanlike appearance, and throughout it is built on standard lines, with a dropped top tube to give a low position.

THE 8 h.p. CHATER-LEA ENGINE.

Though the Chater Lea Manufacturing Co. have been manufacturing engines for same time, Mr. Chater-Lea recently told us that even now many people were of the opinion that his engine was not made at the Golden Lane works. This is absurd, as we have seen the engine actually being manufactured, and a very interesting engine it is. This twin-cylinder, 85 × 85 mm., is designed specially for the propulsion of the Chater-Lea No. 7 sidecar machine and the Chater-Lea quadcar, and has a low compression so that it may keep cool. Not the least interesting part about it is the valve gear, which is both simple and ingenious. Though it is a twin-cylinder fitted with mechanically-operated inlet valves, there are only three timing wheels—that on the main-shaft and the two half-time wheels. On the two latter there are two sets of cams, one set, internally cut, operating the inlet valves, and the other set on the other side of the wheels of the usual type working the exhaust valves. Each set of valves is controlled by rockers with rollers at the end engaging with the cams, so as to reduce the friction to a minimum. The internal exhaust lifter is interesting, consisting as it does of a flat-ended spindle to which the control arm operated by Bowden wire is fastened. The flat end, which has rounded edges, presses against the exhaust rockers when turned, and thus raises the valves.

NEW NORTON PULLEY.

Mr. J. L. Norton has lately produced an extremely simple and ingenious adjustable pulley, which he has patented. Herewith we give a sketch showing the principle. The inner flange A carries a boss, which is screwed on the outside and has a keyway cut in it. A key fixed to the outer flange B fits this, and allows B to slide but not to revolve. C is a milled cap which is screwed internally to fit the screwed boss on A. Machined on this cap is a coned face, cut at such an angle that, so long as the belt is in position forcing the flange B outwards, it grips a corresponding coned face in B and locks the whole pulley solid.

The new Norton adjustable pulley.

MILITARY MOTOR CYCLING NOTES

BY "CELERITER"

ALL motor cyclists who in the past have taken part in Army Manœuvres should feel sympathy with Mr. Stewart in his present unfortunate predicament, for it is to him they are indebted for being invited to take part in the operations; for it was he who organised the intelligence service and to a great extent defrayed the expenses thereof out of his own pocket.

Those motor cyclists, therefore, who in recent years have taken part in Army Manœuvres will have watched with great interest the trial of Mr. Stewart for espionage at Liepsig. Mr. Stewart has paid the penalty of being too keen. Last July, ignorant of the German language, he went over to the Fatherland during the Morocco crisis to find out for himself what the chances of war might be. Within forty-eight hours he was arrested as a spy, locked up for six months, and now at his trial he has been given three more years of confinement. For some years past Mr. Stewart has during manœuvres been attached to the staff of the Cavalry Division. We motor cyclists who like to take part in Army Manœuvres will miss him this year—his tact, his energy, unfailing good humour, and kindly consideration for all those with whom he came in contact. The Germans may call Mr. Stewart a spy and imprison him as such, but those of us who know him vote him a "jolly good fellow," and will be glad to see him back.

Motor Cyclists for Manœuvres.

It was Mr. Stewart who was asked last year to draw up a report for the authorities on the best means of obtaining motor cyclists for manœuvres, and it is an open secret that two alternatives were set forth.

The first was that which *The Motor Cycle* has consistently advocated, that of forming a Motor Cycle Staff Corps as an independent unit of the Territorial Army, the members being attached for drill, etc., to the nearest Territorial unit, but grouped in sections all over the kingdom. The other alternative was officially to recognise the motor cyclist sections belonging to the thirteen cyclist battalions, giving the men suitable petrol allowances and special pay to cover the wear and tear of machines. For reasons of economy the second alternative will be adopted, and in April next we may expect to hear that motor cyclists will be organised on the lines suggested in my notes last month.

This Year's Army Manœuvres.

It is proverbially unprofitable to attempt to foreshadow forthcoming events, but there seems every indication, provided Parliament assents, that this year Army Manœuvres will be held on a very big scale over much the same ground as was contemplated last year, that is, in East Anglia. In August there will be a cavalry concentration of four or perhaps even five brigades, and it is on the cards that four or six battalions of Territorial cyclists will also be called upon to take part.

The dates will probably be from September 14th to the 19th. Also there will be the Divisional Manœuvres, when cyclists and motor cyclists will be employed, lasting until Mid September, when the season will finish up with a week of grand manœuvres for all arms. Motor cyclists who wish to participate should take steps soon to join one of the Territorial cyclist battalions, as it is more than likely that outsiders who do not join this year will not in future years be invited to come out and participate in the fun and excitement of Army Manœuvres. These prophecies may be false, but unless I had good reason to believe them approximately correct I would not put them forward.

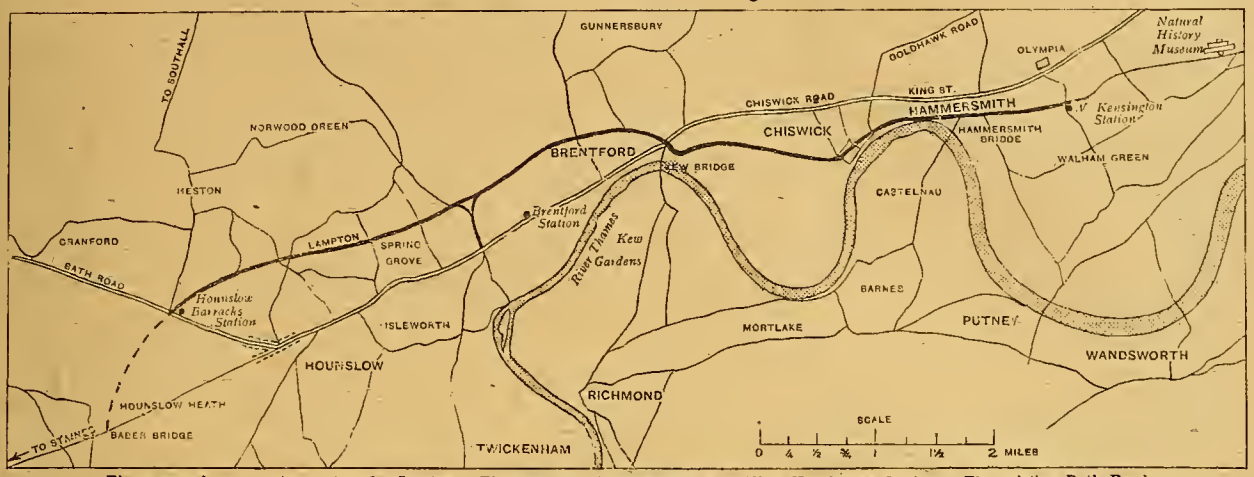
The Ideal Military Motor Cycle.

In view of the divergence of opinion amongst motor cyclists as to the most suitable form of motor cycle for military purposes, it would be interesting to have the opinions of those who have most experience. In this matter it must be remembered how very few experts there are, if any, for a man may well be an expert in all that regards the riding and handling of his machine and yet be a novice in military matters, or *vice versa*, and since the readers of *The Motor Cycle* are more likely to be expert motor cyclists than expert soldiers, it might be as well to postulate some of the most important features that a machine should possess from the purely military point of view in order to approximate the ideal military mount.

A machine used for military purposes must essentially possess the following characteristics:

1. Be able to go dead slow amongst troops, and as fast as possible on an open road. It must not only be foolproof and weather-proof, but liable to as little mechanical derangement or tyre trouble as possible, and it must have sufficient power to be able to start on a steep gradient if stopped on a hill.
2. It must have sufficient power to tow a cyclist when required, or to carry the blankets, spares, and kit of its rider.
3. It must be particularly well-sprung, especially as regards the front forks. Now almost any two-speed free engine of high power when suitably built up is able to fulfil the above, but at the same time it is extremely advisable that a military machine should not be so heavy that when the engine is at fault the rider is powerless to move the cycle along.

I do not pretend to be a motor expert, but I have ridden many and various types of machines at Army Manœuvres, and my experience leads me to believe that if it were possible to mount a three-speed 4 h.p. twin engine on to a light frame so that the cycle complete would not exceed one hundredweight we should then have something as near the ideal as possible.



One point to remember is that one does not want a machine that needs a lot of adjustment, or that is difficult to start. Nor does one want a racer. A machine that can average 30 m.p.h. on an open road and climb any gradient from a standstill is what is required. Doubtless such a machine if made would also find a ready market amongst non-military riders.

SIDECARING AT NINETY-NINE.

The veteran sidecarist is the Rev. H. M. Sherwood who died a few weeks ago at Pershore. In the warm weather he was fond of riding in a sidecar attached to his son's 1911 Triumph. The deceased gentleman rode a boneshaker bicycle in the sixties; it was therefore fitting that he should find the sidecar a great improvement upon a Bath chair.

A New Western Artery for London.

The proposed new western artery for London. The eastern end commences near West Kensington Station. The existing Bath Road is shown by a double line.

SEVERAL announcements have been made of late which serve to show that active steps are being taken to better the lot of Metropolitan motorists. If the road conditions are improved for the car user the motor cyclist will derive ten times more benefit. Only those who are active users of motor bicycles can appreciate how much a good surfaced road not thronged with heavy traffic means to them. The latest announcement is that of the Road Board, which proposes to construct a new westerly main road exit from the Metropolis. That such a road is wanted there is no shadow of doubt. Hammersmith Broadway, King Street, Hammersmith, and the disgraceful Brentford "bottle-neck," with its double line of trams, are objectionable and dangerous items in a long tram-laid road, which riders even in these days of flexible engines do not care to face on a single-geared machine. Thanks to the courtesy of the secretary of the Road Board, we have been enabled to go over the original map showing the course of the projected new route.

The proposal is that the West Cromwell Road should be extended and a bridge made over the West London Extension Railway, and the road carried due west, leaving Hammersmith Broadway on the right. The river is then followed for a short distance, and a due westerly direction is then struck until Kew Bridge is reached. This is an important point, as here the proposed new route crosses the Hounslow Road at right angles, strikes north-west and then west, completely avoiding the abominable Brentford. When level with the end of Brentford's death trap, a loop road is to be constructed leading into the Hounslow thoroughfare. Leaving this point, the road extends through comparatively open country until it joins the Bath Road at Hounslow Barracks. From this point a dotted line is shown on the map leading to East Bedfont, on the Exeter Road.

Of Special Value to Motor Cyclists.

No words can express the value of the proposed route to motor cyclists entering or leaving London, but the question arises as to whether or not the Road Board, which has none too much money to spend, would be justified in paying £850,000 of the estimated cost—£1,750,000. Would it not be better for the Board to continue its good work of improving the main thoroughfares in the country by smoothing out dangerous corners, and thus making its influence more widely felt throughout the kingdom? We are inclined to think so, but we do hold that the Brentford by-pass might be built, as the condition of the main road through the Middlesex capital is a disgrace to civilisation. Reverting again to the proposed route, we noticed, on perusing the original map, that apparently very few existing roads will be utilised, and as the building of the new road will necessitate much pulling down of old buildings, the purchase of much property, and the construction of a bridge, the estimate appears to be none too liberal.

New Route to avoid London.

In another direction much good road work is being done, and that is the mapping out of a route round London, which is being carried on by the Royal Automobile Club, and very shortly a map, drawn up by a capable committee, will be published by a well-known firm which will enable motorists to see how to travel east to west and north to south on the outskirts of the Metropolis without once meeting thick traffic. The county rider is equally benefited thereby, as by using it he will be able to travel, say, from Doncaster to Croydon, from Hounslow to St. Albans, or from Dartford to Enfield without getting tied up in a maze of carts, omnibuses, and electric trams. Such a map was given in an issue of *The Autocar* about two years ago, but the R.A.C. map will be sold separately, and will be on a rather more elaborate scale. That such a map is badly wanted is clearly proved by the number of routes we are asked to work out so as to avoid London

MOTOR ROLLER SKATES FOR ROAD AND TRACK.

A French production fitted with a V type two-cylinder engine of ¼ h.p. It is said to be capable of 30 m.p.h. The accumulators and spare wheels are carried in a case attached to the waist of the skater.

Midland Open Reliability Trial

Scene at the Start

ON Saturday last the Sutton Coldfield A.C. annual open reliability trial was held over typical winter roads, the entries, which numbered 106, constituting a record for a reliability trial. The chief award was the Colmore Cup, presented by Mr. F. S. Whitworth, and held by Mr. W. D. South, who last year rode a Scott. The best represented makes in the trial were the Premier and Rudge with seven each, there being six New Hudsons and five Quadrants. Thirty-four amateurs entered for the special prize, but this section performed disappointingly, for only six accomplished non-stop runs.

The start was at 9.30 a.m. from the Gun Barrels Hotel, Bristol Road, Birmingham, and just before the starting time the long line of competitors' machines, together with the many officials and spectators, formed an impressive sight.

The regulations for this trial were, in our opinion, most praiseworthy. The ordinary long-distance trial over a flat course is as uninteresting and valueless as one can possibly imagine, and the Sutton Coldfield A.C., recognising this fact, select several well-known acclivities for embodiment in the route, and rely mainly upon the hill-climbs to weed out the weaklings. Further, they demand that the hills be taken on the run with hot engines, which makes the test still more instructive and nearer the ideal.

104 Starters.

One hundred and four entrants answered to the roll-call, and they were despatched in pairs at half-minute intervals. One of the non-starters, James St. John, the energetic trials hon. secretary, unfortunately skidded on the exceedingly treacherous road surface, breaking his magneto bracket. Most of the competitors had adopted some special form of mud shield, undertan or belt guard, on the lines of those illustrated in these columns of former trials, and they were badly needed on Saturday, for the roads could hardly have been in a worse state. There were two ladies in the trial, Miss Berend and Miss Hough, the former riding a new model, a three-speed O.K.-Precision with sidecar, the bicycle of which had an unusual design of frame, half diamond and half open. Harry Reed's Dot was noticeably quiet, and on investigation we found he had adopted a recent suggestion of *The Motor Cycle*, viz., to fit an extra large silencer under the frame of the sidecar. C. R. Collier was competing in his first reliability trial. Fancy the English champion a novice!

Marks were awarded for ease of starting, so that before getting under way several competitors lost marks, including A. B. Wade (Zenith sidecar), whose passenger pushed and leapt over the back of the sidecar, A. D. Arter (James), E. Smith (Regal-Precision), A. Winchcombe (Macbeth), N. M. Hall (Corah), and W. W. Douglas (Douglas). Within a stone's throw of the start Cheshire (Triumph) experienced a fall.

The route was *viâ* Longbridge and Rednal to Rose Hill. This ascent is not a severe one, but hereabouts the surface was particularly slippery, which accounted for the fact that at this point no less than sixteen spoilt their non-stops. Through Bromsgrove to Crabb's Cross, Alcester and Stratford presented no difficulties except to keep upright. N. Crozier (2¾ Levis) had the high-tension wire come out of the magneto terminal, and he lost much time fitting it in again.

W. D. South (3½ h.p. Rudge) at the top of Sunrising hill.

Competitors preparing to re-start from the foot of Warmington Hill.

H. Morgan suffered a burst tube, and later the throttle wire broke and caused a further stop. H. Egginton (New Hudson sidecar) broke a valve and, after almost having made up time, punctured. P. Brewster (Norton sidecar) retired, as his low gear would not grip, whilst T. Peck (Rudge) also dropped out of the running, reason not stated. Miss Berend was early in trouble with her new machine, and was considerably delayed, but undaunted, she kept on.

The conditions overhead were excellent, a fine bracing air with the sun doing its best to peep from behind the clouds. Troubles were continually befalling the riders, though of a minor character. W. H. H. Sheldon (Regal-Precision) several times pulled up with mysterious overheating, W. Russell (Quadrant) was passed effecting an adjustment. E. V. Pratt (Ivy) stopped to clear the jet which choked three times during the day, and N. Allday (3½ Alldays) had a petrol pipe break.

The Ascent of Sunrising.

At Sunrising a small crowd had gathered, and we noticed with pleasure that on this occasion there was no dearth of officials to observe the performances. It is indeed good to think that so many honorary workers are willing to give up their Saturdays in the interest of the pastime, and so many others willing to loan official cars.

J. Chater-Lea (8 h.p. Chater-Lea) making a good ascent of Warmington. He made a non-stop run.

Sunrising, as was to be expected, fetched many out of the saddles, but to turn to the other side there were some really excellent performances. Jack Woodhouse (Regal-Precision) was up first, and travelled at a fine pace to the top; albeit, his machine was noisy, and at the finish he was disqualified along with R. H. Clark (T.T. Corah) for excessive noise. W. D. South (Rudge)—the holder of the Colmore cup—by dint of judicious slipping of the clutch, managed to get up, his slow speed being explained by a choked jet. R. Lord (6 h.p. Rex) created an excellent impression as also E. F. Baxter on a sister machine; W. W. Douglas, who with back down shot up as if he were Tee Teeing, and H. C. Newman (Ivy) performed splendidly. Probably R. H. Clark (T.T. Corah) was the fastest, but there was little to choose between him and G. Brough (6 h.p. Brough), W. F. Newsome, and E. W. Cheshire (free engine Triumphs). By the way, the two last mentioned machines were noticeably quiet, probably in anticipation of the much-boomed A.C.U. cut-out rule being carried into effect for the first time!

Good Ascents on Variably-geared Mounts.

Some of the variably geared machines, which travelled slowly but surely, included Arter's James, Graham Dixon's and Beard's New Hudsons, Winchcombe's Macbeth, Gibb's Douglas, Greaves's Enfield, Bushby's twin Humber, Taylor's Rudge, North's Ariel, Mundy's P. and M., and Slaughter's L.M.C. P. J. Evans climbed practically all the way on the top gear of his 1912 3½ h.p. Humber, which machine, beside being prettier, is much more powerful than its predecessors, a fact of which we have had practical proof.

One or two had very hard lines. For instance, Seymour Smith (Norton) got almost on the crest of the hill but his high gear just failed him. Fenn missed gear on his Humber and stopped. P. Moss (3½ h.p. Premier sidecar) found the gradient just too much for his limited engine power and ran alongside a few yards; whilst E. A. Marshall (2¼ h.p. S.I.A.M.T.) got up with pedalling—an excellent performance for such a tiny engine. But the eye-opening performance was by H. Newey on a 2¼ h.p. two-stroke Levis. He had no pedals, yet climbed the hill unaided in astonishingly good style.

The passenger machines, generally, made a fine showing, C. R. Collier on an 8 h.p. Matchless with double belt drive and V.S. two-speed gear made no mistake; the two Morgan runabouts had plenty of power in hand, which may also be said of F. Smith's Clyno, Colver's Enfield, J. Chater Lea's sidecar, and Yates and Bryant's Rex-Japs. F. W. Finnemore (Veloce) broke his high gear and retired, whilst W. Russell (Quadrant) punctured.

Continuing along the ridge of hills, competitors descended Edge Hill, turned to the right in the village of Kineton and proceeded to Warmington, where a stop was arranged. The hill was really no test after Sunrising, especially as engines

Midland Open Reliability Trial.—

were cooled at the foot, yet three came to a standstill. Lunch was taken at the Red Lion, Banbury, one and a half hours being allowed.

The Re-start.

It was not permitted to start engines on the stand, and on receiving the word to go, officials noted the ease with which the engines responded and deducted marks accordingly. The return route was over the same roads as in the morning, the *pièce de résistance* being the ascent of Edge Hill, the corresponding ascent to Sunrising, concerning the respective severity of which gradients no two motorists are agreed. There was a big crowd of motor cyclists and car owners assembled to witness the fun.

Practically all who did well on Sunrising reproduced their success, South (Rudge) making no mistake this time. Newey made another brave attempt to conquer the hill on his little Levis, but failed near the top owing to a slipping belt. Descending after tightening it, he annihilated the 1 in 6 gradient with ease. H. Pickering (2½ h.p. A.J.S.), who was going well, missed his gear change, but picked up again after assisting with his feet, which procedure involved loss of marks. By the way, this rider had a small water tank on the top tube which allowed cold water to drip on to the exhaust valve cap. Moss (Premier) had to stop this time, as also Spittle. H. Berwick (until lately riding Humbers and now with the New Hudson Co.) had to pedal, but Rigby, Dixon, and Beard (3½ h.p. New Hudsons), appeared to have plenty in hand. The twin Rexes ridden by Lord and Baxter again pleased the spectators, and were certainly among the fastest machines. Brough let his machine out on this hill for the first time. C. Peers (Lincoln Elk) had a most unusual experience. He was going well when the celluloid inflator attached to the bottom rail must have come in contact with the hot cylinder, for it burst into flames. W. S. Overend (P.V.) was again brought off solely owing to belt slip. Miss Hough (Douglas) received a well-deserved ovation. The only exciting incidents were when Gibb (Douglas) and Rowlandson (Rudge) finding themselves side by side were seized with the spirit of emulation, and crouching low down on their machines, tried to outpace each other. Eventually the little Douglas forged ahead and won by ten yards, on its low gear at a speed of about fifteen miles per hour. The other incident was when three sidecarists, all going well, were almost abreast and scattered the line of spectators. Marshall was another who failed owing to a slipping belt, the muddy state of the roads no doubt accounting for this trouble. Walsgrove (Hazlewood) this time made a clean climb, though he fumbled his gear on Sunrising. A. A. Tye (on a 2½ h.p. Premier) stopped on the very crest; he deserved a better fate. Viggers (Enfield) had a stop near the Round Tower, so he went home to Banbury.

After descending Sunrising the only ascent of note was Gorcutt Hill near the finish, which troubled nobody except

F. H. Stevenson (Morgan Runabout) climbing Warmington. He was one of the few amateurs to make a non-stop run.

The usual busy scene in the yard of the Red Lion Hotel, Banbury, the turning point of last Saturday's trial.

Midland Open Reliability Trial.—

E. W. Allday (3½ h.p. two-speed Alldays) nearing the summit of Edge Hill where the gradient is steepest.

the unlucky, one of whom was Miss Hough, whose gear lever jumped into neutral. Troubles were not over. N. R. Davies (Blumfield) ran over a fowl, which broke his front wheel mudguard, so he threw it away. As may be imagined, he presented a pretty spectacle plastered with mud from head to foot. South had to change a plug near Alcester; Reed's auxiliary silencer had broken away from its brackets and was trailing, then a stone got in his belt rim and spoilt his clean record; H. A. Shaw, whose four-cylinder F.N. was as quiet as any, was considerably delayed; P. Pumphrey (Arno) was obviously in fear of a fall, and no wonder, for as we rode behind him we detected his wheels out of line; H F. Ladsgrove (B.S.A.) did well, but for a skid. Here is a genuine case of ill-luck! L. Yates (Rex-Jap sidecar) climbed all hills and had a splendid run until fifty yards of the finish, when he came to a standstill with a dry petrol tank. The finish was arranged at the Alcester Road tram terminus, and all but one or two managed to get in before dark, but there was insufficient light to attempt any examination of the efficacy of the mudguarding as had been intended.

Complete Official Results.

The band of willing officials after collecting the competitors' cards repaired to a private house, and thanks to the arrangements of Mr. Howard Smith, the hon. sec., the list of non-stops was announced the same evening.

There was some grumbling concerning a wrong measurement on the route card to the control at Warmington, and a number of competitors contended that they lost time at this check owing to being misled by the mileage At a meeting of the Sutton Coldfield A.C. Committee on Monday evening it was wisely decided to ignore this check entirely..

The official results are given hereunder, the order of merit in the case of equal marks being determined by the time at the secret check:

COLMORE CUP AND GOLD MEDAL.

		Marks.
1.	Frank Smith (5-6 h.p. Clyno sidecar) ...	200
2.	G Brough (6 h.p. Brough)	200
3.	Rex G. Mundy (3½ h.p. P. and M.)	200
4.	R. Lord (6 h.p. Rex)	200
	B. W Lee (3½ h.p. B.S.A.)	200
5.	H. Graham Dixon (3½ h.p. New Hudson) ...	200
6.	W. B. Gibb (2¾ h.p. Douglas)	200
7.	A G. Rigby (3½ h.p. New Hudson)	200
8.	P Phillips (2¾ h.p. Douglas)	200
9.	R Holloway (3½ h.p. Premier)	200
10.	T Pollock (3½ h.p. James)	200
11.	C. R. Collier (8 Matchless sidecar)	200
12.	H. V. Colver (6 h.p. Enfield sidecar) ...	200
	J. Oliphant (3½ h.p. Premier)	200
13.	H. J. Woodgate (3½ h.p. Macbeth)	200
	S. A. Rowlandson (3½ h.p. Rudge)	200
14.	H. C. Newman (3½ h.p. Ivy-Precision) ...	200
15.	W. F. Newsome (3½ h.p. Triumph)	200
16.	V. Busby (2¾ h.p. Humber)	200
17.	J. H. Slaughter (3½ h.p. L.M.C.)	200
18.	W. W. Douglas (2¾ h.p. Douglas)	200
19.	J. Chater-Lea (8 h.p. Chater-Lea sidecar) ...	200
20.	H. Greaves (2¾ h.p. Enfield)	200
21.	R. E. Guest (8 h.p. Matchless sidecar) ...	200

J. Woodhouse (3½ h.p. Regal Precision) gained full marks, but was disqualified owing to the noise of his engine.

All the above scored full marks, the under-mentioned, who made non-stops, lost marks for being late at controls, or for difficulty in starting.

	Marks.
P. J. Evans (3½ h.p. Humber)	199
Vernon Taylor (3½ h.p. Rudge)	199
F. C. North (3½ u.p. Ariel)	198
F. H. Stevenson (8 h.p. Morgan runabout) ...	198
E. Harvey (5 h.p. A.J.S. sc.)	198
S. Fontaine (3½ h.p. Quadrant)	198
E. Smith (3½ h.p. Regal Precision)	198
R. W. Duke (3½ h.p. Zenith Gradua)	197
G. Bryant (6 h.p. Rex-Jap sc.)	197
E. F. Baxter (6 h.p. Rex)	197
Douglas Arter (3½ h.p. James)	194
H. Pickering (2½ h.p. A.J.S.)	194
A. Winchcombe (3½ h.p. Macbeth)	192

PRIVATE OWNERS' AWARDS.

R. E. Guest was awarded the gold medal for the best performance by an amateur.

F. H. Stevenson wins the pair of Hutchinson tyres for best performance other than a prize winner.

Thirty-eight competitors accomplished non-stop runs, and of these twenty-four scored the maximum of 200 marks.

There were a number of plucky riders of single-geared machines in the trial. Those who showed up well on the hills included R. Holloway's Premier, Newsome and Cheshire's Triumphs. Clarke's Corah, Baxter's Rex, Brough's Brough, Heaven's Bradbury, Marshall's S.I.A.M.T. (with pedalling), and Newey's Levis.

We heard of two competitors who failed on Rose Hill, Rednal, only six miles from the start, and went home.

Three sidecarists descending Sunrising Hill on the homeward journey. P. Moss (Premier) leading H. V. Colver (Enfield), followed by C. R. Collier (Matchless).

Anglesea M.U.

This newly-formed club is affiliated to the A.C.U. President, Mr. H. R. Davis; captain, Mr. O. H. M. Williams; hon. treasurer, Mr. H. Pickford; hon. secretary, Mr. G. E. Roberts.

Haslingden M.C.C.

A general meeting will be held on Thursday, the 29th inst., at the headquarters of the club, Blackburn Road, at 7.30. All motor cyclists in the district are cordially invited.

Oxford University M.C.C.

There will be a motor cycle hill-climb for members of the University, at Horsepath, near Oxford, on March 9th. Entries to be sent in to Mr. A. C. Hardy, New College, Oxford, before March 7th.

Derbyshire and North Staffordshire A.C.

A motor cycle section has been formed with a strong committee and a present membership of twenty-five. Applications should be addressed to the hon. secretary, Mr. E. Russell, Nuns' Pingle, Ashbourne Road, Derby.

North-west London M.C.C.

A novel competition will be held on Saturday, March 2nd. This will take the form of a night paperchase, or Will-o-the-wisp competition. Lanterns as well as paper will be used to mark out the course. The competition will be of about one and a half hours' duration. Competitors will meet at the High Stone, Barnet, at 6.30 p.m., when the car carrying the scent will start.

Birmingham M.C.C.

The ninth annual general meeting was held at headquarters, on Saturday, the 17th inst. The following officers were elected for the year 1912: President, Mr. H. Austin; captain, Mr. R. W. Duke; treasurer, Mr. E. W. Winckle; trials secretary, Mr. H. J. Cox; secretary, Mr. R. Vernon C. Brook. Six new members were elected to the club. There will be an open hill-climb at Wenlock Edge on June 1st.

Mid Bucks M.C.C.

The annual meeting was held on Wednesday last when the following officers were elected:

President, Mr. A. C. de Rothschild, C.V.O., treasurer, Mr. T. Loader; captain, Mr. H. T. Ball; sub-captain, Mr. F. Edgington; vice-captains, Messrs. E. H. Eborn and G. Owen. An interesting programme was drawn up for the season and new members will be heartily welcomed by the hon. secretary.

Bishop Auckland, Darlington, and District M.C.

The winter reliability trial of the above club, for the Rex Motor Manufacturing Co's silver cigarette case, was held on January 28th last to Wetherby and back, and resulted in a tie between Presland (Chater-Lea), Foster (Triumph), and C. W. Smith (New Hudson). The winner will be decided on the best performance of the above three riders in the opening reliability trial.

Derby and District M.C.C.

At the annual general meeting the following officers were elected for 1912: Chairman, Mr. E. V. Clarke; captain, Mr. A. Ainsworth; hon. secretary, Mr. A. B. Bennett.

The competition for the Russell Challenge Cup will be re-run on the 24th inst. The course will be a circular one, starting from Allestree.

The open hill-climb will take place on March 30th at Oakamoor (between Ashbourne and Cheadle). There will be classes for T.T. machines, 3½ h.p. singles, large twins, and an all comers' event.

Wakefield and District M.C.C.

A meeting will be held this evening (the 22nd inst.) at eight o'clock, at the Graziers' Hotel, Market Street, for the purpose of forming a motor cycle club. Motor cyclists are invited to be present.

Worksop and District M.C.C.

At a meeting held at the Royal Hotel, Worksop, it was decided to form a motor cycle club, and the following officers were elected: President, Mr. R. Allen; vice-president, Mr. A. G. Tomlinson; hon. treasurer, Mr. G. Kemp; hon. secretary, Mr. F. Burton; 2a, Ryton Street, Worksop.

Chesterfield and District M.C.C.

The first annual dinner and presentation of prizes passed off very successfully on the 14th inst. at headquarters, the Hotel Portland, Chesterfield. In proposing the toast of "the A.C.U.," Mr. A. C. Seals pointed out that motor cyclists owed a great debt to that body which, by exhaustive test and trial, had done much to perfect the modern machine.

Chester and District M.C.C.

It is suggested that a motor cycle club be formed for Chester and district. All motor cyclists interested are requested to send their names and addresses to Mr. A. H. Catlow, Glen Auldyn, Kilmorey Park, Chester, and should sufficient names be received a meeting will be called to discuss the scheme.

Westmorland M.C.C.

The open hill-climb on Brigsteer Brow will include classes for lightweight singles up to 360 c.c.; singles, 480 to 580 c.c.; singles, unlimited; lightweight twins up to 480 c.c.; twins above 480 c.c.; variable gears over 480 c.c.; unlimited with sidecar; unlimited on time. The entries close on March 31st.

Essex M.C.

The open hill-climb takes place on the 16th March, and classes for all types have been arranged, including lightweights, 500 c.c., twin cylinders, passenger machines and runabouts. The venue of the hill will be kept secret, so that a fair chance is given to all competitors. Entry forms and particulars are now ready, and can be obtained from Mr. Ernest J. Bass, Bishops Stortford, Herts. Entries close on the 9th March.

Salford M.C.C.

At a meeting of the Salford motor cyclists, held on Thursday, the 15th inst., at the Langworthy Hotel, it was decided to form a motor cycle club. The following were elected as officers: Captain, Mr. A. Hopkinson; vice-captain, Mr. W. Jordon; treasurer, Mr. S. Chrisp; secretary, Mr. T. Metcalfe. The opening run was fixed for February 25th, start from Langworthy Hotel at 10 a.m. Intending members are invited to attend the run or write to T. Metcalfe, 193, Langworthy Road, Salford, who will willingly forward full particulars.

A.C.U. ONE DAY TRIAL.

Entries for the A.C.U. one day trial, on Saturday, March 2nd, stood as follows on going to press:

J. Kerr (3½ N.S.U.)
R. M. Brice (3½ Brown)
C. Tinline (3½ Rudge)
E. W. Cheshire (3½ Triumph)
W. F. Newsome (3½ Triumph)
G. T. Gray (3½ Rudge)
O. C. Godfrey (7 Indian sc.)
B. A. Hill (7 Indian sc.)
E. Frassetti (7 Indian sc.)
W. Cooper (3½ Bradbury)
Cecil Roberts (3½ Rover)
F. W. Applebee (2¾ Centaur)
R. Lord (6 Rex)
Frank Smith (5-6 Clyno sc.)

Entries close on Saturday.

Club News.—

Blackburn M.C.C.

This club, formed in July last, has now fifty members. The season is to commence with a club run and hill-climb, particulars of which can be obtained by members at the monthly meeting on the 29th inst.

Grosvenor M.C. (Manchester).

The opening run will take place on the 3rd of March next, to Bell's, Peover; meet headquarters, Unicorn Hotel, Altrincham, at 2.45 p.m. Other runs for the month will be: 13th March, Matlock: 17th March, Chester; 24th March, Southport; 31st March, Tarporley. The secretary, B. Turner, Wood Dene, Brooklands, Cheshire, will be pleased to receive names of any intending members.

Bolton and District M.C.C.

The annual general meeting was held at headquarters on Wednesday, the 14th inst. It was decided again to affiliate to the A.C.U. The subscription for 1912 is to be 7s. 6d. The officers elected for season 1912 are: President, Mr. H. Holmes; chairman, Mr. Curwin; vice-chairman, Mr. A. R. Batten; hon. secretary, Mr. N. Haddock; treasurer, Mr. Leadbetter; captain, Mr. S. Parker; vice-captain, Mr. L. Hordman.

Chorley and District M.C.C.

A meeting was held on Wednesday, the 14th inst., at Court Chambers, Chorley, for the purpose of establishing a motor cycle club. The various officers and committee were elected, and it was decided to adopt the above name. The secretary will be pleased to receive enquiries from any motor cyclists in the district. The temporary headquarters and secretary's address are Court Chambers, 17, St. Thomas's Road, Chorley.

Maidenhead and District M.C.C.

On Monday, February 12th, an enthusiastic meeting was held at the Saracen's Head Hotel, Maidenhead, to discuss the formation of a club for Maidenhead and district. Mr. A. W. Heybourne was appointed chairman *pro tem.*, and rendered great assistance in framing the rules and conducting the meeting After due discussion, a club was formed, about eighteen members being enrolled. It was decided to limit the radius for members to six miles, to hold competitions, and to have weekly runs every Thursday and Saturday alternately. A discussion then took place as to whether quadcars and runabouts should be eligible, and it was finally decided not to admit them. It was decided that the headquarters for the present should be the Saracen's Head Hotel. The officers for the ensuing year were then elected: Captain, Mr. R. C. Owen-Wells; vice-captain, Mr. C. C. Browne; hon. sec. and treasurer, Mr. H. H. Hacker.

Messrs. Neal and Deakin, designers and makers of the Canoelet sidecar, are practical motor cyclists, and are frequently to be seen in the Birmingham district with their 6 h.p. Triumph and Canoelet sidecar.

The A.C., or Auto Carrier, is being largely adopted by commercial houses as a handy and cheap means of distributing the lighter form of goods. The carrier illustrated is one lately pressed into service by a typewriter company.

Motor Cycling Club.

The opening run will this year again be to the Old Ship Hotel, Brighton, meeting at Crawley, on Saturday afternoon, March 23rd, and returning the following day. The Exeter medals will be presented in the evening.

Southampton and District M.C.

The annual general meeting was held on the 14th inst., when the following officers were elected: President, Mr. A. H. Oakley; captain, Mr. S. Docking; vice-captain, Mr. S. W. Duggins; hon. sec. and treasurer, Mr. H. Percy Young. At the conclusion of the meeting Mr. A. H. Burnand read a paper on carburetters.

Cardiff M.C.

The newly formed motor cycle section has now been inaugurated, and it has been decided to affiliate to the R.A.C. and A.C.U. A club room has been arranged for at the Globe Hotel. The opening run will be to the Speech House, with a hill-climb in the vicinity. Two open meetings will be held in conjunction with the South Wales A.C. A mass meeting of motor cyclists will be held at the Globe Hotel, on Saturday, the 24th inst., at 8 p.m. Particulars of competitions may be obtained from Mr. T. Parry 24, Boverton Street.

Surrey M.C.C.

The following competitions have been arranged for the coming season: March 27th (Wednesday), opening run and speed-judging contest; April 24th (Wednesday), members' hill-climb; May 15th (Wednesday), petrol economy competition; June 1st (Saturday), penalty run; June 25th and 26th, reliability trial to Exeter, for the Triumph Challenge Cup, starting on Tuesday night; July 27th (Saturday), twelve-hour reliability trial.

It is hoped to arrange also with the Hants M.C. Union an inter-club hill-climb, to be held on a Saturday about the end of August.

For the chief competitions there will be an attendance qualification for the first prizes. Those members who propose to enter for these competitions should therefore endeavour to qualify in good time by regular attendance at club events.

Scouting Section.—The sub-committee is at present preparing a scheme and programme for the coming season. Those members who are interested in this work are requested to send in their names at once to Mr. G. S. Williams, Sandycombe, Ridgeway, Woking.

LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost and Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and, should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication.

Questions and Replies

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor. "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Low Registration Number.

Please let me know in what county I can get a low registration number for my motor cycle.—R.W.C.

Low registration numbers can be obtained in the following Irish counties: Clare, Carlow, Donegal, and Monaghan.

Harrogate to Cockermouth and Colwyn Bay.

Would you kindly tell me the best route, avoiding all the large towns possible from: (1.) Harrogate to Cockermouth (Cumberland). (2.) Harrogate to Colwyn Bay (North Wales)? Would you kindly also state distance to these places?—C.E.H.M.

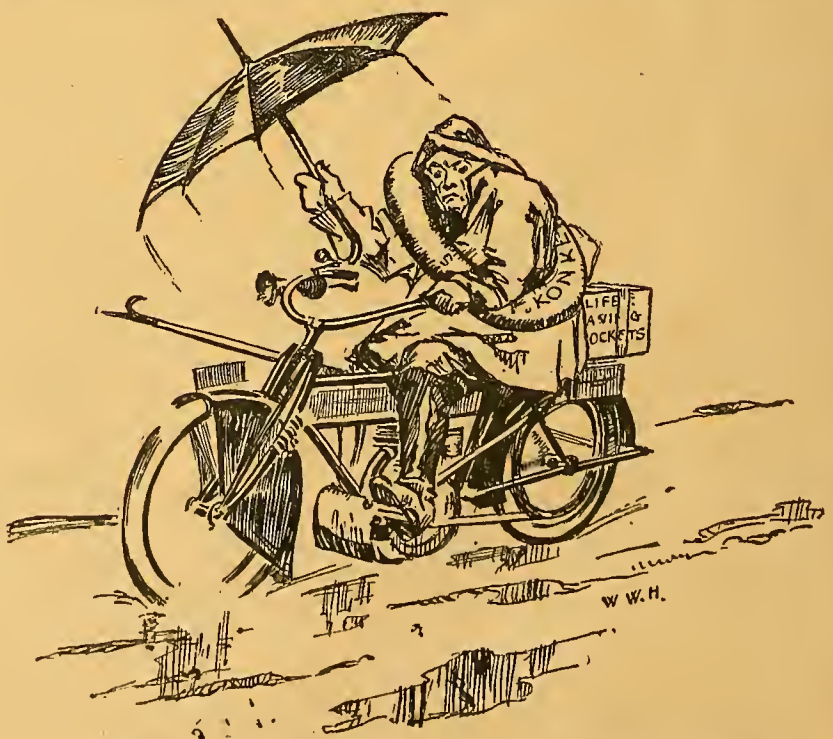
We have pleasure in giving you the following routes: (1.) Harrogate, Ripley, Ripon, straight along the road to Thirsk until you meet Leeming Lane, go straight along Leeming Lane, turning left at Scotch Corner, turn left again, and go through Bowes, Appleby, Keswick, to Cockermouth. The distance is approximately 119 miles. (2.) Harrogate, Blubberhouses, Skipton, Gisburn, Clitheroe, Preston, Rufford, Ormskirk, Liverpool, by ferry to Birkenhead, Eastham, where turn for the road to Hawarden, and go through Holywell to Rhyl, whence there is a direct road to Colwyn Bay. The distance is approximately 150 miles.

The Uses of a Two-speed Gear.

(1.) Do you consider the B.S.A. two-speed free-engine gear quite reliable and foolproof, and suitable for hard wear? (2.) Would a two-speed gear be any great advantage for town and traffic work with sidecar? (3.) Am I right in presuming that when riding solo one could throttle down as slow with a free engine, and keep one's balance, as with a two-speed gear? (4.) Would the two-speed gear eventually pay for itself by saving the belts and tyres?—G.H.C.

(1.) The gear in question should be suitable. (2.) Such a gear would be of an undoubted advantage for traffic riding with a sidecar. When riding solo you would hardly need the low gear at all, but it would be useful in traffic and you would have it always in reserve in the case of an emergency. (3.) With a free engine one can slow down almost as much, provided a good clutch be fitted and the gear ratio itself be not too high. (4.) A two-speed gear would be more valuable in enabling you to get up any hill and to start on any gradient than it would be in the saving of belts and tyres.

Sidecar for Devon.



(1.) Is the 6 h.p. Matchless with two speeds and free engine quite suitable for occasional sidecar use, and sidecar tours, say, in Devonshire? I presume this machine would be quite easily handled as a solo mount in traffic? (2.) Is the Millennium two-speed and free engine quite suitable for above machine? (3.) Is Maude's Portland sidecar, advertised in the columns of *The Motor Cycle* a good investment and quite suitable for use with above machine? Is the weight of this sidecar (78 lbs.) heavy or quite normal? (4.) Jones £3 3s. speedometer—what of this? (5.) Could you tell me approximately the weight of the Matchless single-geared machine?—H.M.B.

(1.) The machine in question would be quite suitable for use with a sidecar, and would be quite easy to handle in traffic. (2.) The gear mentioned is good, but the one used by the makers of the machine is the V.S. (3.) Yes; the sidecar in question is good value for the money asked for it. We should say that the weight is normal. (4.) The speedometer mentioned here is excellent. (5.) We think that the weight would be about 180 lbs.

Maximum Intensity of Spark.

Can you help me in this matter? I have a Bosch magneto, D.A.2, and when I fully advance my magneto I do not get such a brilliant spark at the plug as when the lever is about half-way advanced. I certainly have my make and break a bit wider apart than usual.—B.M.

This is only natural. The maximum position occurs rather in advance of half-way in the quadrant. As you advance the spark further its intensity becomes a little less, but as the intensity increases with the speed you get quite as strong a spark at high speeds as you would do at low or medium speeds when the lever was at maximum position. The extra gap at contacts would cause later firing.

A SUITABLE OUTFIT SUGGESTED BY THE RECENT INCLEMENT WEATHER.

Upkeep of a Big Twin.

I am thinking of changing my 3½ h.p. machine, which I find insufficient to take a sidecar, for an 8 h.p. Matchless. But before doing so, I want to know, roughly: (1.) How many m.p.g. an 8 h.p. engine and sidecar would go, and also whether the average upkeep of a twin would be much more than a single. (2.) Do you recommend the Matchless for rough hill work and for all-round work?—R.F.D.B.

(1.) You must, of course, expect the upkeep to be rather more than that of a single-cylinder. The machine would run between fifty and sixty miles to the gallon of petrol. Also, you would have to pay more for tyres and belts. (2.) We can thoroughly recommend the machine for rough work.

Fitting Hub Clutch without Alteration to Frame.

Some months ago, my brother in India wrote to a certain accessory manufacturing company ordering a free engine clutch hub and wheel, stipulating that they were to be built so as to fit his 1911 Douglas (single-speed model) "without structural alteration" to the frame. The company undertook to carry out the order, but on receiving the hub and wheel my brother found that the width over cones was 5¾in., whereas the width of the Douglas forks is only 4¼in. I have therefore been in correspondence for him with the makers of the hub, who first asserted that no structural alterations were necessary, "as it is quite an easy matter to pull the forks open with one's hands to the width required." On writing to Messrs. Douglas Bros., however, I was informed that the forks cannot be pulled open to the desired width. In their last letter to me the makers of the hub still maintain that no structural alteration is necessary. (1.) Do you consider that forks normally 4¼in. wide can be opened without structural alteration to take a hub which is 5¾in. over cones, or have you ever known of a case where it has been done? (2.) If it cannot be done, have I a legal claim to a refund of the amount paid for the hub and wheel? (3.) If the makers are liable to refund the cost of the hub, can they also be compelled to refund the cost of carriage to India?—K.D.K.

(1.) Messrs. Douglas are right, the forks cannot be forced open to such an extent by hand without damaging the frame. (2 and 3.) There is a good claim against the accessory manufacturers, but it is only your brother in India who can commence proceedings. You cannot issue a summons here on your brother's behalf, but a solicitor can do so in the County Court, provided security to the satisfaction of the Registrar is given for the costs of the other side, in the event of the other side winning the case. The solicitor's own undertaking with regard to this would be sufficient. As the accessory manufacturers evidently knew that the hub and wheel were going to India, we think the carriage both ways could be recovered from them. In our opinion, your brother should return the goods before the action is commenced, and request that his money be refunded. The best plan is for you to see a soliciter before you do anything further.

Adjusting Petrol Level.

Petrol runs over top of jet, even when back wheel is on stand, off ground. On steep hills the engine pulls up, with absolute loss of power with a choked sensation—presumably too rich a mixture. I have adjusted the float until there is hardly any play at all (which ought to reduce level). Float appears to be good, air and petrol tight. For example, under no circumstances whatever can I ever get up Brockley Hill, Edgware. Otherwise the engine is in splendid condition in all respects, and I think the sole trouble is carburation.—J.H.L.L.

You may get over the difficulty by adjusting the collar on the needle valve. First of all, mark the spindle so that you will know exactly where the collar was originally; then heat this, put the needle loosely in a vice and gently hit the head, so that the collar is slightly raised. This should have the required effect. Detailed instructions for adjusting the petrol level are given in "Motor Cycles and How to Manage Them."

Registration and Liability.

I have bought a second-hand motor cycle for the purpose of renovating and selling at a profit. The machine was I believe, registered at Bristol, but no registration fee has been paid for some while, as the machine has not been ready for riding, and the original number is still on it. If I cancel this number now, will the authority drop on me for any arrears, and if I get a licence for it will the same thing happen?—G.E.O.

No, you are not liable, except for the transference of the number to your name. What you had better do is to write to the authorities, tell them the facts of the case, and ask them, if the number has not been cancelled, to transfer it to your name. If the number has been cancelled, then you are liable for the full registration fee of 5s. The registration refers to the machine and not to the owner; and if the registration has not been cancelled, all the authorities can do is to exact a fee of 1s. for transferring the number to you.

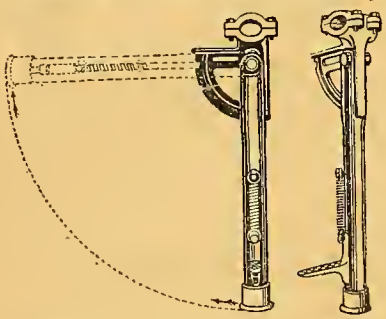
EDITORIAL NOTE.

Owing to the increase in the number of enquiries desiring readers' experiences of motor cycles and accessories, the feature has been transferred to page 189.

PILLION SEATS.

Though the above method of carrying a passenger must always be characterised as risky, it is surprising how many ladies, utterly oblivious of the chances they take, willingly accept an invitation to try the carrier seat. We recently heard of a married couple undertaking a long tour in the manner depicted. The machine is a free engine Singer.

Electric Lighting for Motor Cycles.



Messrs. Nye and Co., 16, Hampstead Road, Tottenham Court Road, N.W., are the London agents for the Polkey-Jarrott electric lighting set described in the last issue.

Motoring in Ireland.

We are in receipt of the latest Burrow's Guide, entitled "Motoring in Ireland," which is published under the auspices of the R.A.C. Touring Department. The whole matter has been carefully gone through by Mr. H. A. T. Moroney, the capable manager of that department, and it is interesting to note that the letterpress has been written by Mr. C. G. Harper, the author of "The Autocar Road Book." A feature is a bird's eye map of the country, showing the principal roads and natural fatures.

New Sidecar Stand.

Messrs Pace and Co., London Colney, Herts., have lately introduced a new Ukantes sidecar stand. This follows the principle of the same firm's motor bicycle

stands, which have been on the market for many years. The sidecar stand is fixed to the axle by means of four bolts, and is securely locked in whatever position the leg may be put. The bolt which locks the leg of the stand is controlled by a pedal, so that the stand may be put in and out of action without stooping to lock and unlock the bolt. When out of use the leg is in alignment with the chain stays of the motor bicycle.

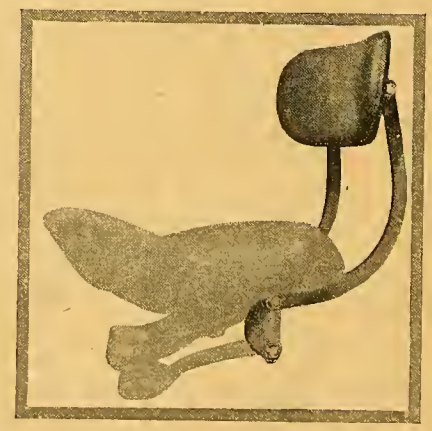
New Northern Depot.

The Northern Depot, Ltd., Leece Street, Liverpool, advise us that they are shortly opening a new showroom in the old Argyll premises in Liverpool, and will show "everything motorish." They are sole agents for a large district for the A.C. Sociables and Kerry-Abingdon motor cycles, and carry a good stock of electrical and rubber goods, XL'All saddles and Jones speedometers. The depot will be under the management of Mr. S. Kenneth Broadfoot, A.M.I.E.E.

Lamps.

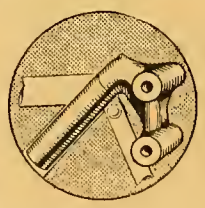
The latest catalogue of Messrs. Miller and Co., Ltd., Miller Street, Birmingham, is aptly entitled "A Catalogue of Lamps that won't go Out," and is an excellently got up and instructive publication. In it the various types of lamps manufactured by this well-known firm are clearly listed and described, and also various component parts of which they are constructed. A novelty which is a speciality of Messrs. Miller and Co., Ltd., is an acetylene tail lamp, which should appeal to users of quadcars and such like vehicles.

Crank Pin Design.

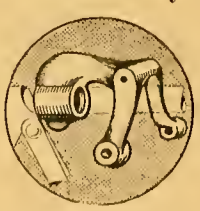


The English patent number of the N.S.U crank pin design published on February 8th, page 152, is 8,192, 1911.

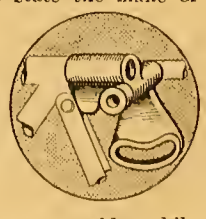
Change Speed Gears.



The Wulfruna Engineering Co., Ltd., Great Brickkiln Street, Wolverhampton, advise us that they are in a position to give prompt delivery of the Thornton two-speed gear, of which they have the sole control.



Low Riding Position.



We illustrate a new XL'All back rest which has been embodied in the design of the anatomical seat. It is designed to

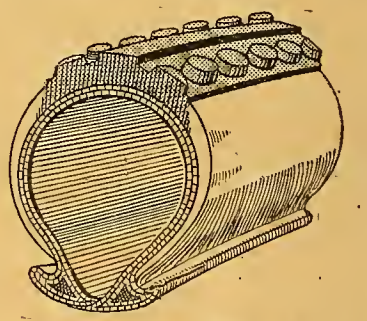
rise and fall with a parallel motion, thus avoiding the rubbing of the rider's back, and it is fixed sufficiently low to be easily cleared when mounting or dismounting. XL'All saddles are now made and supplied with saddle pins to give the lowest possible riding position with any make of motor cycle. This has been rendered possible by a careful study of the design of all makes. A motor cyclist ordering one of these saddles has merely to state the make of

his machine, and the most suitable saddle support is available. We illustrate three examples.

Trade Announcement.

Mr. Harold Williamson, late of the Rex and Singer companies, has been appointed to an important post with the Vacuum Oil Co.

Nortons in London.



Norton motor cycles can now be inspected at Messrs. Robertsons, 157, Great Portland Street, W., who are the London agents. Facilities for acquiring the same machines by deferred payments are being made by Harrod's Stores.

Two New Engines.

Messrs. Job Day and Sons, Leeds, will be shortly placing on the market two new motor cycle engines of 3¾ h.p. and 7½ h.p. These engines have been designed by Mr. H. A. Smith, the designer of the Illston and Smith engines which were recently described in these pages.

A Long Climb.

From Glossop to the Snake with thirty-two stones weight and sidecar has recently been climbed by H. Egginton, of Sheffield, on a 4½ h.p. Excelsior of which he had just taken delivery. Such a feat is not exceptional on summer roads, but there was a good depth of snow on the occasion in question.

The J.P. rubber-studded non-skid cover (sold by John Piggott, Ltd., which is sent out with a guarantee for 3,000 miles. We are about to try one.

Efficiency.

The Otago Motor Cycle Club held its annual hill climb at Saddle Hill, Dunedin, on December 9th, and George Patterson, jun., again did the best performance of the day for efficiency on his 2¾ h.p. three-speed New Hudson.

New Depot.

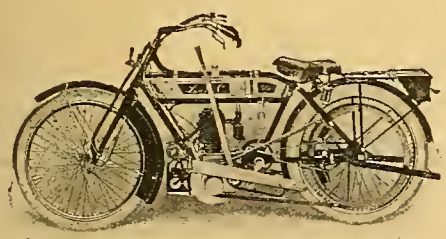
We hear that Wrench's, of 120, Hampstead Road, N.W., have opened new premises in Euston Road, under the management of Mr. W. Hayes, who, in addition to his commercial experience, is a practical rider.

Catalogues Received.

We have received an interesting catalogue from the Roberts Motor Tyre Co., Gripwell Works, St. Mary's Row, Birmingham. This includes a good show of all rubber goods which are of interest to motor cyclists.

The 1912 Brooks book for motor cyclists contains detailed descriptions and illustrations of all Brooks motor cycle specialities from the patent anti-vibratory motor cycle seat to the carbide carrier and sparking plug case. The booklet is artistically printed, and is of interest to all motor cyclists. It can be obtained on application to Messrs. J. B. Brooks and Co., Ltd., Great Charles Street, Birmingham.

Do you realize?



1. *That the* **"Zenith"** *opens a new field of enjoyment?*
2. *That the* **"Gradua"** *gear, by its infinite variation of gear ratio change, reveals pleasures hitherto undreamed of?*
3. *That its reliability, power, and speed are some of its outstanding features?*
4. *That if you have not got a Zenith you are missing a great deal?*

QUADRANT, Lawley Street, BIRMINGHAM.

WRITE FOR LIST.
16 distinct and distinctive models.

NOW, CHAPS!

This week we have a specially good thing for you: we have got a bargain in the way of 1911 new Premiers. These are very similar to the 1912 models, and, of course, you know the quality of their workmanship. The prices are, roughly, £10 less than the price of the machines of the same horse-power 1912 models. We have not yet got the full details of the machines that we have purchased, but by the time you read this advertisement we shall have got them in stock; and if you will drop us a line, we will have great pleasure in giving you full particulars. We are sure it is an opportunity that you will not want to miss. We are prepared to sell them for cash, or exchange with approved machines; but we are sorry we cannot entertain deferred payments on this particular consignment.

In addition to the above, please note that we have the following 1912 models in stock here at Morecambe: P. & M.'s, Scotts, Jap-Eats, Matchless, Clynos, Zeniths, Douglas, Indians, Lincoln Elks, Rudges, Triumphs, Bradburys, Premiers, Humbers, A.C.'s, and we have Morgan Runabouts on order for delivery each month. See last week's advertisement for a portion of our contract, which will be £40,000

In second-hand machines we feel quite sure that we have the largest stock in the world, at prices ranging from £5 to £50.

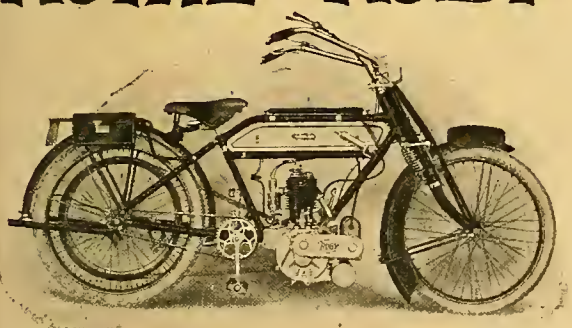
Kindly note that when we advertised machines on the deferred at £3 down, we did not mean that you would be able to get a 1912 Triumph for this sum down, or anything of that kind. A fortnight ago two or three hundred people wrote offering to give £3 down for 1912 models. This, of course, is a ridiculous proposition, and is one that we never intended to convey would be accepted. What we can do is to supply you with any kind of a motor cycle, with one or two exceptions, on the deferred at a slight increase in the price, and the amount of deposit will be governed by the value of the machine. We hope this is now clear to you. We are, of course, still taking on exchanges, and we await your esteemed order for the motor cycle that you are thinking of purchasing. Our terms of business are still the same; what you purchase from us you have on approval, and, if not satisfactory, you return it and have your money back in full. This does not, however apply to new machines. You cannot have any new machine for three days on approval, and then, after trying it, return it, as it will not then be a new machine, but a second-hand one. If you buy it you keep it, as you are supposed to know all about a new machine before you get it. We find it necessary to speak plainly through this column, and it is our only excuse for making the remark.

We are agents for every machine that is worth having, and in all cases we have purchased nothing but two-speed gear models. At the same time the makers will be pleased to alter and supply a single-speed in lieu of the two-speed if our clients so specify.

We are open to purchase from the trade any quantity of Clynos, Zeniths, Douglas, Scotts, P. & M.'s, Morgans, Matchless, and Triumphs, and we await the traders' offers. Our terms are cash with order in all cases. We ask for no credit. We are prepared to purchase from the public a few high-class 1911 machines (two-speed gear preferred), also any quantity of second-hand speedometers, Whittle belting, F.R.S. and Lucas lamps, leather clothing, up-to-date saddles, magnetos, and we will either buy for cash, or exchange, just as the bhoys like. We are in a position to do well for everybody, and we feel sure we can trade with every one of you if you don't want something for nothing—we are not entertaining this kind of thing for the present. If you have never been to Morecambe, make it in your way to blow in, and you will be startled at the size of the stock. We have the new in one department, and the second-hand in the other, and the same applies to accessories. If you don't see what you want in either case, ask for it. In the Accessories Department we are declining, and we want to shift the stuff, so let's have your orders to help us to do it. Send postcard for lists, which are ready waiting to be sent out. They are no use to us here, and were got for the purpose of distribution.

We always prefer the bhoys to come down if possible, as we think it pays them. When they come here they can pick a machine from the stock and try it on the road if they wish to do so, and we can then explain the various levers, etc. On the top of this the railway fare will be less than the cost of carriage on the machine, and the satisfaction is bound to be much better. We are anxious to see you, and have nothing to hide. We have not an elaborate place here, but we have the stock, and that is what you want. We are rough and ready in our system of business, but we get through the trade. We are anxious to make your acquaintance, whether you buy anything or not. We are always very busy, but can spare the time necessary to show you what we have got to sell, and we now look forward to the pleasure of seeing you. Easter will soon be here, and you will want a machine then if you do not want one before. Those who come first will get the pick. Our stock is getting less, as we have had more customers this last week than for the last three months. The weather is improving, and the roads getting better, and we therefore expect the enormous boom to continue.

If you don't know where Morecambe is, then we beg to say that it is four miles from Lancaster, and is on the L. & N.W. and Midland Railway systems, and you can get excursions several times a week from all parts. At the same time, if you come down in the morning, you can ride the machine home, as we do not sell machines that can only be taken home by train.



We are glad to note that our forcible advertisement of a fortnight ago did so much good. We always find it best to speak straight out, and say what we mean. We do not wilfully mislead anyone. If you cannot deal straight with us, you can't do a straight deal with anyone. If you are thin-skinned, and are sooo insulted, our advertisements may insult you. However, while we should be sorry if this is the case, we like to tell you straight out what we will do and what we won't do; so you know what to expect.

As you know, we are the only firm that advertise on these lines, and we find it a most satisfactory way of reaching the public. Misleading advertisements are no use either to the trade or to the public. This is a fault that no one can place on the shoulders of Hitchen's, of Morecambe. We may possibly lose trade through being so outspoken, and we are sorry if this is the case, and take this opportunity of apologising to the Sunny Jims who are likely to be insulted by our bluff letters, but we can only say in closing that "they ask for it." Remember our address:

HITCHENS, MORECAMBE,

For a packet on the 'Phone, our No. is 112; for a Telegram, "Motor, Morecambe."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

SECTION III.

Warchopes

OFF FLEET ST., NEAR LUDGATE.
Telephone: 5777 Holborn.
Wires: Opificer, London.

9, SHOE LANE, LONDON, E.C.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. ooo, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

1911 3½ h.p. **SINGER,** free engine, new..... £49 0
1911 Twin Two-speed **REX DE LUXE** £47 10
5 h.p. Two-speed free engine **ROC** £35 0
1910 7 h.p. Twin **REX,** M.O.V. £37 10
3½ h.p. **FAFNIR,** Bosch, h.b.c., Indian red, Druids £19 10
Magneto **TRIUMPH,** spring forks, very smart .. £25 10
Magneto Twin **REX** £19 19
REX, 1910, 3½ h.p., "hot stuff" £29 10
5½ h.p. Two-speed Twin **REX DE LUXE** £29 10
5 h.p. 1910 Twin **REX,** special machine £29 10
4½ h.p. Four-cylinder **F.N.,** magneto £19 19
5½ h.p. Twin **REX,** very smart £16 10
2¾ h.p. **KERRY,** runs well, spring forks £10 10
1910 3½ h.p. T.T. **REX,** very fast £27 10
3½ h.p. **TRIUMPH,** 1908, very good £28 10
2¾ h.p. **DE DION,** spray carburetter £10 10
3 h.p. **HUMBER,** chain drive £7 10
1909 3½ h.p. **REX DE LUXE,** two speeds £32 10
1908 3½ h.p. Magneto **REX,** spring forks £22 10
1907 3½ h.p. Magneto **REX,** spring forks £19 19
3½ h.p. Tourist **REX,** brand new £29 10
1910 Twin **REX DE LUXE,** two speeds £42 10
New Twin **REX,** Cantilever seat ..... 36 Gns
Twin **REX DE LUXE** and sidecar £27 10
3½ h.p. Magneto **MINERVA** £19 10
MOTO-REVE, magneto, Druids £19 19
MOTOSACOCHE Lightweight £14 10
F.N. Lightweight, magneto, spring forks £19 19
REX, 3½ h.p., spring forks £15 10
1911 3½ h.p. Tourist **REX** £32 10
1911 Single-cylinder Two-speed **REX,** 300 miles .. £42 10
3½ h.p. Two-speed **N.S.U.,** extra good £21 0
3 h.p. **ANTOINE,** h.b. control £12 10
2¾ h.p. **F.N.,** h.b. control, very smart £12 10

A CALL WILL REPAY YOU.

1912 BRADBURY IN STOCK.

Bradbury 3½ H.P

Exchanges Quoted. Distance no objection.

High-class Sidecars, complete with tyre, from £4 15

28 x 2½ CALMON and CLINCHER Covers 14/6
26 x 2¼ Wired MICHELIN Heavy Tricar Covers .. 17/6
Tubes, all sizes, guaranteed 5/11
24 x 2¼ REFLEX Beaded Covers 12/6
Tubes 5/11

MOTOR BICYCLES FOR SALE.

HUMBER, 1910¾, 3½h.p., 2-speed, excellent condition, new back tyre; £32.—O. W. Capewell, Southwell.

1912 3½h.p. Humber, 2 speeds, brand new, in makers' crate; cash offers.—Pollard, Wraghy, Lincolnshire.

3½h.p. Rover, 1911, free engine, capital order, just overhauled; £42/10.—Hollick, 97, Little Park St., Coventry.

TRIUMPH, 1911, F.E., Palmer cords, F.R.S. lamp, Cowey can be had, in grand order.—Tromau, The Elms, Solihull.

1912 Bradbury, Rudge, B.S.A., Alldays, New Hudson, 2¾h.p. and 3½h.p. 3-speeds in stock.—Blackburn, Spalding.

TRIUMPH, 1910, first-class condition, just overhauled tyres in good order; cash £32.—Hulbert, Hunning ham, Leamington.

1912 Triumph and New Hudson, 3-speed, clutch, and standard, in stock.—Mason, Triumph agent, Wellingborough.

TRIUMPH, early 1911, never been ridden, owner went to Canada; sacrifice £37, or best offer over —152, Parade, Leamington.

3½h.p. New Hudson-Jap, single speed, 1911 model splendid machine bargain. £33.—Cady, 177, Grove Rd., Sparkhill, Birmingham.

REX De Luxe, 1908, 6h.p., Roc clutch, Cantilever seat, car tyre, perfect; any trial; £20, or exchange lightweight.—1, Gosta Green, Birmingham.

1911 Twin Rex de Luxe, 5-6h.p., free engine, 2 speeds, brand new, just delivered. — Box No. 9,634, *The Motor Cycle* Offices, Coventry.

4h.p. Clyde, J.A.P. engine, low built, recently re plated and enamelled, winner of reliability and hill trials; £25.—Wait and Co., Ltd., Clyde Motor Works, Leicester.

3½h.p. Bradbury, 1911 model, just tuned up by makers almost as good as new; £40, or near offer.—Wait and Co., Ltd., Leicester.

LINCOLN 1912 Models in stock; Triumph, free engine, B.S.A., Zenith Gradua, Enfield 2-speed A.J.S.; early application necessary.—West's Garage, Lincoln.

TRIUMPH, 1910½, F.E., Palmer tyres, Cowey speed indicator, 2 lamps, Mills-Fulford sidecar, in first class order; owner buying car.—Adkins, miller, Broom Junction.

ROYAL Enfield, 2¼h.p. (Sept., 1910-1911 pattern) nearly new Dunlop and Kempshall tyres, black enamel, spares, splendid order; £24.—Robinson, 4, High St., Nottingham.

1911½ N.S.U., 3½h.p., Model de Luxe, 2 speeds, free engine; cost £53/10; only ridden 30 miles, absolutely as new; bargain, £40, near offer. — 72, Oval Rd., Gravelly Hill.

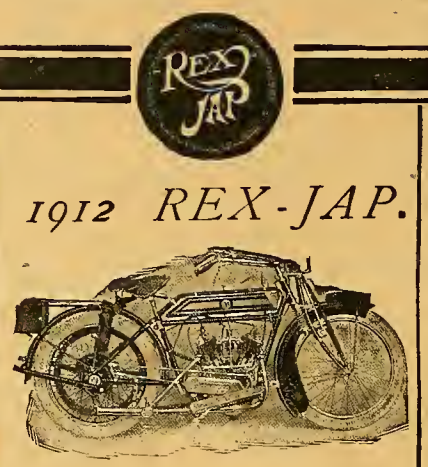
VINDEC Special, 4h.p., late 1909, Bosch magneto B. and B. carburetter, h.b.c., free engine, all in splendid order; bargain, £24.—64, Triton Rd., Small Heath, Birmingham.

3½h.p. Rex, B.B. carburetter, h.b.c., Mabon clutch spring forks, special saddle, footboards, new Palmers, new belt, perfect, reliable; photo; £25.—9,712 *The Motor Cycle* Offices, Coventry.

FOR Sale, 2h.p. Motosacoche, magneto, Whittle, all h.b.c., Clinchers, free engine, 1911 machine, and everything in first-class condition; £24.—Winteringham, Ltd., St. Andrew's St., Northampton.

TRIUMPH, 1911, free engine, in splendid condition, with lamp, horn Jones speedometer, and Brooks extra large toolbag and spares; a bargain, £45.—Captain Eliott, 55, Park Rd., Coventry.

J.A.P., 4h.p., Druid forks, magneto, Kempshall tyres, stand and carrier, B. and B. carburetter, built to order, £33; if with 2-speed hub, £41.—F. Hopley and Co., Upper Highgate St., Birmingham.



TRIUMPH, 3½h.p., late 1909, only done about 6,000 miles, just been overhauled by makers, splendid condition; price £35, including tools and spares; owner requires 5-6h.p. But or Mutchless.—Poynton, 25, Chester St., Coventry.

TRIUMPH, 1909½, standard, carefully used, nice appearance, all accessories, guaranteed, £32½; also late 1910 twin Enfield, 2¼h.p., 40 guinea Khaki model, unused to June, 1911, all accessories, guaranteed, £25; both delivered free.—Holt, Motors, Leamington.

1911 6h.p. T.T. Matchless, overhead valves, not ridden 300 miles, in excellent order, £42; 1911 3½h.p. Humber, new July, 2-speed gear, free engine, splendid condition, £39; 1910 3½h.p. Triumph, very little used, and in good order; £29.—8, Shakespeare St., Nottingham.

REX, 6h.p., M.D.L., 2-speed gear, Lucas lamp and generator, belt case, 2 spare tubes, horn, just overhauled, £35; T.T. Triumph, 1911, new condition, Palmer cord tyres, £37; Indian, 5h.p., new Feb., 1911, £36; Phelon and Moore, 3½h.p., with sidecar, just overhauled by makers, £36.—Guyver's Garage, Stratford-on-Avon.

DOUGLAS, 1910, condition excellent, just overhauled, Autoclipse lamp, horn, watch, 2 Brooks pannier bags, Brooks saddle with collapsable back rest, spring seat pillar, Brooks touring bag, with inside case, tools, Palmer cord tyres, excellent condition; owner going abroad; accept £29; inspection invited.—Apply, Wulters and Co., Ocean Chambers, Birmingham.

1912 REX-JAP.

Specification of 8 h.p. de Luxe Model.

ENGINE—8 b.p. Twin-cylinder J.A.P., 85 x 85 mm.

"The motor that is full of life."

"The motor that is all life."

FRAME—Exceptionally strong, built of double-butted tubes throughout, with brazed-on lugs for Sidecar.

SPRING FORKS—Made under 'Druid' License.

SPRING CANTILEVER SEAT—New pattern, absolutely insulating driver from all vibration.

SADDLE—Brooks, Padded top B104P, fitted with Brooks' Patent Compound Springs.

IGNITION—New 1912 enclosed type Bosch High Tension Magneto, fitted behind engine in a thoroughly sheltered and very accessible position. Handlebar controlled.

CARBURETTER—Brown and Barlow, handlebar controlled.

LUBRICATION—Patent Automatic Sight-feed Lubricator, also auxiliary hand-operated pump.

MUDGUARDS—Strong and wide, with side flap to front mudguard, and shield over belt.

TANK—Fitted with extra large filler caps and straining gauzes for both petrol and oil.

CARRIER—Strong Tubular Carrier, with compartment for tool bag, leaving top of carrier free for luggage.

CLUTCH & TWO SPEED GEAR—Live axle, hand-starting (made under Roc licence), simple, self-contained, and fully enclosed.

TYRES—650 x 65 Grooved Dunlop on back wheel. 26x2½ Rubber Studded Extra Heavy Dunlop on front wheel.

We shall be pleased to post you Catalogue describing the many advantages of this unique machine.

AGENTS—Write for Contract terms.

COLONIAL DEALERS—The Rex-J.A.P. Colonial models will be of interest to **YOU.**

THE PREMIER MOTOR CO., LTD.,

Aston Road,

BIRMINGHAM.

MOTOR BICYCLES FOR SALE.

SECOND-HAND Motor Cycles.—We never hang on to second-hands. A quick turnover is what we want, and that is why we offer second-hand motor cycles at pounds below other houses. We have just received delivery of a large number of new 1912 Douglas machines, and have placed these with customers who have exchanged their 1911 and 1910 mounts. You know the saying, "Once a Douglas rider always a Douglas rider." These second-hands are being thoroughly renovated, and will be cleared at bargain prices. 1910 Douglas, from £22; 1911 Douglas, from £27. £25 spent on a Colmore Douglas will prove a fine investment. Let us send you a list of about 60 really good second-hands in stock.—Colmore Depot, 27, Colmore Row, Birmingham.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

1910 Twin Moto-Reve, in splendid condition; £17/17. 3a. Bridge St., Cambridge.

3½h.p. 1911 Standard Rudge, in topping order; £33. —37, Searle St., Chesterton, Cambridge.

1912 Bradbury, free engine model, in stock; first cheque £54/10 secures.—Willmott Bros., Norwich.

1912 Rover, free engine model, £55/5; also 2¾h.p. twin Centaur, £42; both in stock.—Willmott Bros., Norwich.

F.N., 1¾h.p., new cylinder and piston; £15, or exchange.—62, Upper Cliff Rd., Gorleston, Great Yarmouth.

TRIUMPHS, Bradburys, B.S.A.'s, Humbers, Rudges, Enfields, Premiers, Matchless, from stock.—Lambert, Thetford.

PREMIER, 3½h.p., 1911 model, brand new, in crate, £37/10; similar machine, free engine, £43, not unpacked.—T. H. Nice, Bury St. Edmund's.

PHELON and Moore, 1911, special sidecar machine, 2½in. Kempshalls, all extras; cost £64, accept £49; little used, excellent condition.—37, James St., Cambridge.

B.S.A.! B.S.A.! B.S.A.! — Early deliveries of all models of these celebrated machines; second-hand machines part payment.—A. F. Garnham and Co., sole agents, Ipswich.

3½h.p. N.S.U., magneto, recently overhauled by makers, perfect condition, spares, good tyres, Riches tubes; accept £20, or near offer.—J. Riches, 22, Howbury St., Bedford.

3½h.p. Triumph, 1907, B. and B., h.b.c., Palmer cords, new belt, thoroughly overhauled last June, condition perfect; £22.—Motorist, 9, John St., Rose Lane, Norwich.

CAN Deliver the following 1912 models from stock: Zeniths, 3½h.p. and 6h.p.; Douglas, models K.T.; Enfield, 2-speed, 2¾h.p.; B.S.A., clutch; Singer, clutch; Bradbury, clutch; Matchless, 6h.p. standard.—King and Harper, Cambridge.

BRADBURY, standard, £48; New Hudson, 3-speed, 47 guineas; 1909 Triumph, Cowey, lamp, horn, £34; 1907 Triumph, overhauled, lamp, horn, £23; Chater-Lea sidecar, nearly new, £7/10; exchanges; 1911 2¼h.p. Humber, equal new, £25.—Wilderspin, agent, Chatteris.

1912 L.M.C. Motor Cycles, 3½ and 4h.p., immediate deliveries; all models in stock; catalogue and best terms.—W. E. Sneezum, 14, Fore St., Ipswich, sole agent Ipswich and district, including Felixstowe, Walton, Woodbridge, Melton, Wickham Market, Framlingham, Hadleigh, Needham Market, etc. Trials and interviews by appointment.

SECTION VI.

Worcestershire, Herefordshire, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

DOUGLAS, August, 1911, perfect, and equal to new, many spares; what offers?—Deeley, Bromsgrove.

RUDGE, 1911, T.T., F.E., in excellent running condition; £42.—Passey and Hall, Ltd., Ross, Herefordshire.

1¾h.p. Motosacoche, thoroughly overhauled, condition perfect, Palmers; £16.—2, Penybryn, Gobolfo, Cardiff.

£37.—1911 Rex, 5h.p., perfect condition, new Dunlop, take any hill; approval, deposit.—O'Callaghan, The College, Worcester.

FOR Earliest Deliveries of Triumph, Humber, Enfields, Singer, Premier, apply at once, Griffiths, Cycle Emporium, Llanelly.

BROWN, 3½h.p., in perfect running order, magneto, non-skid tyre, new belt; £15; will ride 50 miles.—Frank, Post Office, Evesham.

TRIUMPH, 1912, F.E. (new), in stock; would take 1911 F.E. Triumph in part exchange.—Passey and Hall, Ltd., Ross, Herefordshire.

NEW Hudson, 2¾h.p., 1912, 3-speed model (new), in stock; would take 1911 F.E. Triumph in part exchange.—Passey and Hall, Ltd., Ross, Herefordshire.

1910½ Triumph, perfect condition, P. and H. lamp, Jones speedometer (trip mileage), exhaust whistle, spares; £38.—Williams, 67, Gwydr Crescent, Swansea.

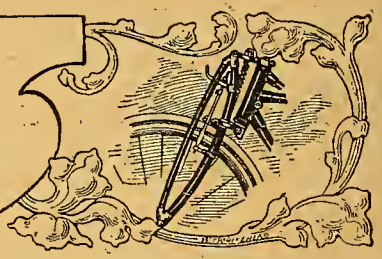
The Trade and the T.T.

THE meeting of the motor cycle section of the Manufacturers' Union referred to in our last issue, where one of the items on the agenda was to consider the Tourist Trophy Race Bond, was duly held, and the decision was that the bond should be sustained. Two or three prominent members brought forward strong arguments in favour of the races being supported as heretofore, but they could not carry the meeting and were finally outvoted. The principal reason offered in favour of the bond being upheld was that the trade recognised at the time they signed the document that it was a binding agreement, and that any arguments against it should have been raised beforehand and not after it had been signed. This latter is a dignified way of looking at the subject, but not in our opinion a final and binding reason for refusing to cancel the bond, provided it was wrong in principle or detrimental to the industry and pastime. However, the bond is sustained, and will, we believe, be adhered to loyally. The A.C.U. will have to do the best it can without the Manufacturers' Union, whose members—at least those who have signed the bond—cannot aid their clients more than to tune up any machines ordered for the race to the best of their ability at their works and hand them to the purchasers. More than that they cannot do without breaking the terms of the bond. The signing of the bond was not, however, unanimous, and already three or four manufacturers have entered for the race.

We still believe that, despite the decision of the manufacturers, practically all the best makes will be represented by private owners who will, we hope, be genuine amateurs in every sense of the word. At the same time, we cannot help thinking with our knowledge of what occurs in connection with the T.T. and other important events that there are very few men who are prepared to buy their racing machines and accessories, pay entrance fees, all their own training and other expenses, and race purely for the honour of winning, even if they are in a position to do so. There are exceptions, of course, but we doubt if they are sufficiently numerous to make a really successful race. The trade should not close their eyes to this.



The A.C.U. will also find it difficult to organise the two races over the long course without financial assistance from the trade in the way of entrance fees, neither can it expect monetary help from the Manufacturers' Union in the same manner as it was assisted by the Stanley Show Committee if it run contrary to the wishes of the Union. It has been suggested to us that if the A.C.U. would even now confine the race to private owners the Manufacturers' Union would make a handsome donation towards the fund. The dispute which took place between the N.C.U. and A.A. regarding the control of pedal cycle racing resulted in the Manufacturers' Union giving the N.C.U. £250 to help the latter to retain its control of the pastime; if it would do this for the N.C.U. it would probably do as much or more for the A.C.U

Whether the race be a mixed one or not the chief point to our mind is to ensure that all who enter as private owners do not obtain assistance in any form. Unless the regulations are most carefully drafted and rigidly adhered to there is a strong possibility that "shamateurs" will creep in, and if stratagem be resorted to it is one of the most difficult problems to detect who is or who is not a genuine private owner.

LUBRICATION.

Can we Improve upon Existing Systems?

THE lubrication of the motor cycle engine is a matter which for a year past has aroused considerable interest. True, the pump of to-day is a vastly improved affair, and in expert hands the system is one which gives excellent results. There is a total absence of complication, and one may apportion the oil supply according to the load or speed of the engine, so that quite a good case may be made out for a policy of letting things be.

However, we are not all experts, and many would welcome some automatic device which would require no attention.

Again, convenient and efficient as the hand pump is it is decidedly not ideal. The ideal lubricating system should give a steady supply of oil, whereas the pump injects large doses at considerable intervals.

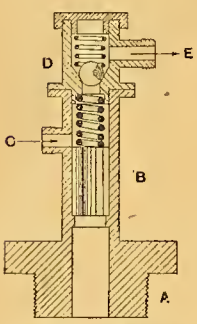


Fig. 1.—An automatic pump to take the place of one of the valve caps.
A. The plug fitting.
B. The plunger.
C. The inlet from tank.
D. Ball valve for outlet.
E. Outlet to crank case.

The Drip-feed, etc.

Motor cycle lubrication has so far gone through very much the same stages as car lubrication did in the early days. The hand pump being abandoned as a nuisance by the motorist, the drip feed came into vogue, and although this in turn has been long supplanted on the car by more scientific systems, it represents the most advanced oiling system in use to any extent on motor cycles at the present time. The drip gives a steady supply of lubricant and lends itself to accurate adjustment, but the oil being thick and the feed only by gravity the pipes have a tendency to choke, and by the time the sight feed is flooded it may be too late to avoid a seized bearing. Also the sight feed is by no means very reliable, for the oil is splashed all over the glass, rendering it a matter of difficulty very often to see if the oil be feeding at all. Moreover, we must retain the hand pump to fill the crank case after emptying. The Rex arrangement of oil spray in the induction port acts well, but is, of course, subsidiary to the main system. Suction operated systems in which oil is drawn into the crank case on the up stroke of the piston are quite practical.

Lubrication and Wear of Bearings.

It is not generally recognised that with a suitable oiling system wear in bearings can be almost eliminated. Had the ball bearing crankshaft not been rendered practical, and so obviated wear on the main bearings, the crude hand-oiling system would, no doubt, have been supplanted before this. As it is, the main bearings being of the ball type are easily suited in the matter of lubrication, leaving the big-end, gudgeon pin, and cylinder to be provided for. Now the existing method of oiling all these parts is by simple splash, whatever may be the means adopted for introducing the oil into the crank chamber.

But is splash lubrication the only method? Could not a more scientific system be evolved giving freedom from smoking, less carbon deposit, less wear of bearings, and greater economy in oil? The writer thinks so, if motor cycle designers would use a pump and do away with splash. It is quite easy to demonstrate the crudeness of oiling by splash. In the first place, there is no regulation except by the level to which the flywheels dip and their peripheral speed, while such a part as the gudgeon has to rely upon drippings of hot and consequently thin oil containing very often particles of carbon, the result of oil charring on the inside of the piston head, to say nothing of the sediment of carbon and worn metal which is being continually splashed to all the bearing surfaces.

Surely a more scientific way would be to supply each bearing surface independently, and do away with the splash, catching the oil, filtering it, and using it again.

With present-day systems the oil consumption is admittedly low, but there is no reason why one should be steadily pumping oil to waste all day.

A Suggestion for Forced Feed.

What the writer suggests, then, is to take a leaf from the car designer's book, and use a pump, not to put oil into the crank chamber, but to distribute the oil directly to the bearings. If we can overcome leakage, there is no reason why we should not force oil under 5 to 10 lbs. pressure to the bearings, and by so doing form a film of oil between bush and journal which will prevent actual metallic contact.

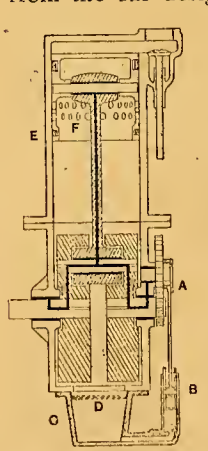

Fig. 2.—Sketch to show the application of forced feed to motor cycle engines. The oil under pressure is shown black.
A. Eccentric driven off half-time gear.
B. Plunger pump.
C. Sump.
D. Wire gauze filter.
E. Scraper ring on piston
F. Holes drilled in piston to allow escape of excess of oil.

This can be done, and has been done, and tests show a steady decrease in the power lost by friction as the oil pressure increases. Also the engine is made more quiet, and the fact that bearings so oiled take longer to run in is proof that the wear is less. Such lubrication also gives an engine which can develop its maximum power for longer periods—a quality which, needless to say, is a most desirable one in a motor cycle engine.

A defect of a pump system is often said to be the difficulty of driving it slowly enough to avoid

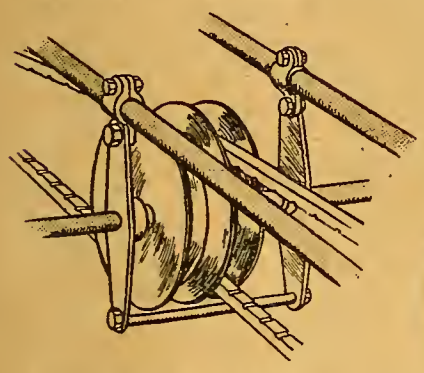
Lubrication—

filling up the crank chamber, and a worm drive is generally considered the only solution.

But if we have a sump in the crank chamber into which all oil drains after exuding from the bearings, and if we use this oil over and over again, only filling up from the main tank about once in a hundred miles to compensate for wastage, the actual amount thrown by the pump does not matter within reasonable limits. We can therefore have a tiny plunger pump eccentric actuated from the timing gear or a little pinion pump. While it is best to "drown" the pump by placing it at the bottom of the sump, so that there would be little likelihood of its pumping air, it might be more convenient to have it directly attached to the timing gear, or even attached to the cylinder. In these cases it would be best to have the lead from the hand pump connected near the feed pump. The simplest pumping device of all would be a simple spring and plunger device screwed into one of the valve caps. It could be adjusted to operate by explosion pressure, the spring providing the return suction stroke, and thus a pump without driving gear would be obtained.

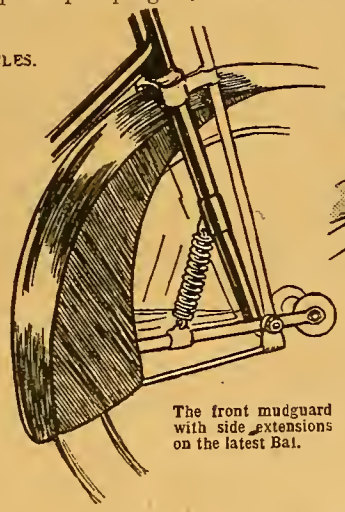
Filtering the Oil.

Given a good oil, well filtered, tests have shown that continued use has little deteriorating effect. It may be discoloured and have a certain amount of water and petrol in suspension, but, if of good body in the first place, retains its quality so long as solid matter is removed. The latter means an efficient filter, and the simplest is merely a fairly fine gauze over the sump. However, this, if fine enough to be really efficient, becomes too easily choked, while it is not altogether easy of cleaning, unless the entire sump, with oil and gauze, can be readily removed. The great difficulty is to arrange for the removal of the pump and filter for inspection or cleaning without wasting oil, and this is best met by surrounding the pump with a triple gauze cylinder, and placing both in a little cylindrical chamber at the side of the sump, so that they can be drawn straight out vertically.



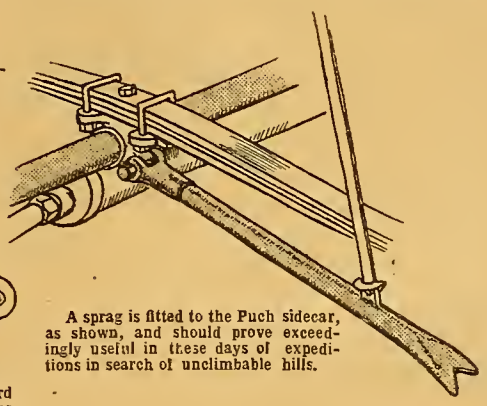
With open ball races there is a little difficulty in introducing the oil into the oil-ways drilled through the crankshaft, but, with a little ingenuity, this could be overcome in several ways. Also, with forced lubrication, the plain bearing would compete quite well with the ball type as regards life, and would give both quieter and smoother running, on account of the substitution of an oil film of considerable surface for the metallic point contact of the balls. From the crank pin a hollow connecting rod would take the oil to the gudgeon, while the oil thrown off the flywheels would more than suffice for the cylinder walls. Over-lubrication of the cylinder is indeed one of the principal troubles with forced feed on cars, but it can be successfully overcome even where the usual baffle plate is omitted. By drilling the skirt of the piston, not only is weight reduced, but excess of oil can escape; while another solution is the provision of a scraper ring at the bottom of the piston. With some means of preventing an excess of oil on the cylinder walls we can flood the other bearings, thus materially decreasing friction and actually helping to cool the surfaces.

With the thicker air-cooled oil and the greater heat one would need larger oil ways than where water cooling is employed, if the danger of blocked feeds is to be avoided.

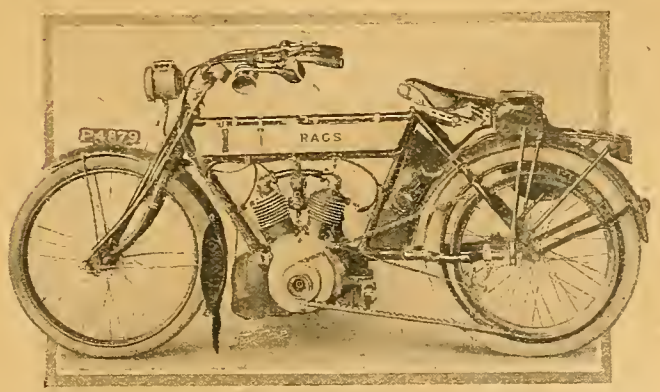


Such, then, is the case for forced feed as applied to the lubrication of motor cycle engines. There are admittedly many difficulties, and, no doubt, opinions will differ as to the practicability of the system, but efficient lubrication being an absolutely vital function of such a mechanism as the light, high speed, air cooled internal combustion engine, one may at least suggest that there is scope for improvement on the crude hand pump.

CYCLOPS.

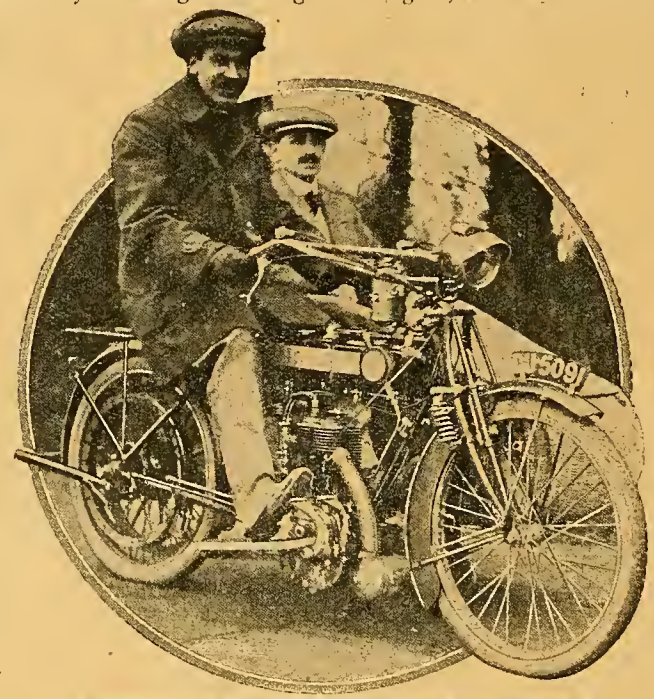


FEATURES OF 1912 PATTERN MOTOR CYCLES.



The rocking pulleys of the Autotrix runabout, giving a variable gear.

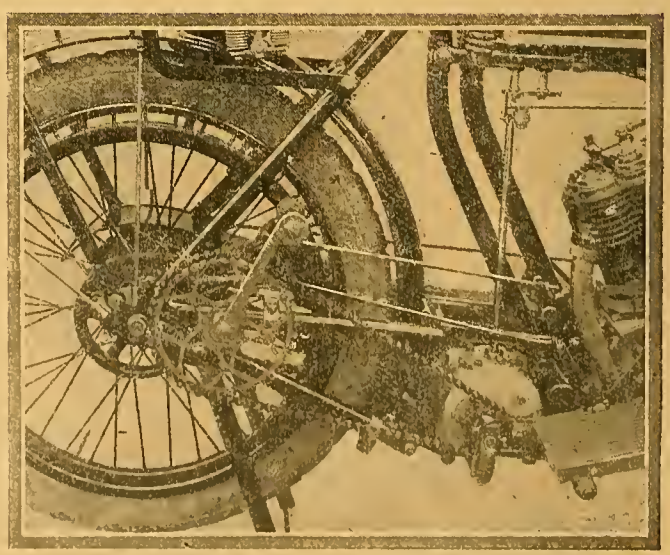
The front mudguard with side extensions on the latest Bat.



A sprag is fitted to the Puch sidecar, as shown, and should prove exceedingly useful in these days of expeditions in search of unclimbable hills.

R.A.G.S., an appropriate title selected by T. W. Tattersall for his Chater Lea-Peugeot. This rider and machine won a gold medal in the London-Exeter run.

Up Edge Hill on a 3½ h.p. Humber Sidecar.



ON the 17th inst. a member of our staff accepted a seat in a Humber sidecar for a trial run to Banbury and an opportunity of seeing something of the Sutton Coldfield Reliability Trials. The machine had only that morning been finished and had had no testing, yet it ran most excellently and with great steadiness in the experienced hands of S. Wright (the holder of the lightweight hour and other records). The engine was the latest model with offset cylinder 84 × 90 mm. bore and stroke, 499 c.c., and was fitted with a half compression device. The magneto was handle-bar controlled. In spite of the heavy roads—and they *were* heavy in places—the machine made light of the gradients, and we sped along merrily to the foot of Edge Hill. Having lowered the gear we started the climb with engine still hot and got within 150 yards of the top, not through overheating, but due to the gear not being low enough. As time was getting on we did not stay for another attempt then, but went on to Banbury, where we lunched with the Sutton Coldfield competitors. In the afternoon we returned to Edge Hill, and after witnessing the ascents, good, bad, and indifferent, another attempt was made, this time with a cool engine, and the machine came up well; also after again returning to the foot a second ascent, with a stop and restart on the hill, was successfully carried out. This must be considered very satisfactory in view of the fact that many 3½ h.p.'s failed when ridden solo (there was only one 3½ h.p. with sidecar in the trials). The Edge Hill test being satisfactorily accomplished we returned to Coventry by way of Stratford-on-Avon, and in spite of the mud the Humber showed a very good turn of speed, touching 35 m.p.h. in suitable places, and having no difficulty in keeping up with a 3½ h.p. solo machine. Although the machine had had no previous test, only one small adjustment was required throughout the day, viz., the tightening of one of the two-speed gear bands, which was done in half a moment. The engine started easily and pulled very well, and the conclusion forced upon us was that the Humber sidecar combination was an eminently serviceable mount, and very stable in grease.

The 1912 two-speed Humber sidecar, some experiences with which are recounted on this page.

NEW BAT FOOT STARTER.

The Bat sidecar is now fitted with a foot starting device, consisting of a large sprocket to which the pedal is attached, carried eccentrically in a bracket brazed to the off-side of the rear fork adjacent to the back axle. The after of the two gearshafts carries a set of dogs, the corresponding set of dogs being carried on a free wheel running on a phosphor bronze spindle attached to a bracket fastened to the gear box. The ratio between the free wheel sprocket and the larger sprocket is 3 to 1 (the total ratio from starting pedal to engine being 6 to 1). The free wheel, which is carried on a phosphor bronze spindle so as to obviate wear, possesses a ball pushed up against the spindle by means of a spring. At the end of the bracket there is a pedal attached to the arm for pressing the free wheel sprocket in engagement with the dogs on the gearshaft. On the starting pedal being depressed and the engine started the free wheel is automatically thrown out of engagement with the gearshaft. The plunger inside the free wheel serves to prevent the latter from being pushed accidentally into engagement with the gearshaft. The starting pedal is provided with a stop against which it normally rests.

A foot starter is the latest addition to the Bat sidecar.

OCCASIONAL COMMENTS

BY "IXION"

Lighting Dynamos on Motor Cycles.

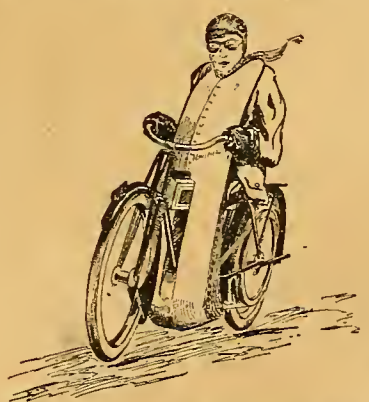
There seems to be a certain tendency to hail the advent of lighting dynamos upon motor cycles, but in my opinion it is a somewhat premature tendency. Acetylene head lamps may be susceptible of improvement, but the man who carries a couple of simple generators and exercises ordinary commonsense in operating them seldom has any real ground for complaint. In putting a miniature lighting dynamo on a motor bicycle at the present moment it appears to my mind that the rider is burdening himself with extra weight, complication, and unreliability, and obtaining less in the way of illumination. A detachable dynamo may well prove to be the light of the future, but at the present moment I cannot compare it with a good acetylene outfit in point of lightness, simplicity, and reliability. In my opinion the next stage should be small tanks of dissolved acetylene.

Magneto Timing.

I can well remember when makers stamped no timing marks on the valve gear pinions, and the unlucky wight who rashly disturbed his pinions frequently spent many hours in the effort to find a setting which did not cause both his valves to open and close simultaneously or achieve some other equally weird eccentricity.

To-day the thoughtful factories save such gentry from themselves by stamping the timing wheels in unmistakable fashion. But the magneto timing is not similarly safeguarded, and quite a crop of cases came under my notice last year in which unskilful amateurs were hung up through inability to time their magnetos.

In some instances the friction-held sprocket on the armature spindle shifted; in others the timing was disturbed in the course of repairs; in others the chain stretched or broke, and so on. We want to make the machines as fool-proof as possible, and words fail to describe the folly of many enthusiastic riders. I am well aware that all makers give instructions in their handbooks, but the hints leave room for wide error. A careless rider fails to judge the top of the compression stroke by two or three millimetres; he further misjudges the exact break of the platina by several more millimetres; he puts his ignition lever in the wrong position during timing operations; and he finally lets the sprocket or pinion slip on the armature spindle while he is tightening the nut, with the result that his home-made timing is often inaccurate.



It would be a very easy matter for the makers to safeguard duffers in this respect, as they are already safeguarded in respect of valve timing. A punch-mark on the inner flange of engine pulley or sprocket would indicate the piston's dead centre to a hair; and a supply of gap-gauges (for use between armature and pole-piece) could be used for setting the armature, and would serve as stops against which to tighten the driving sprocket or pinion; alternatively, the better plan of a rigid lock for the driving member, as utilised by one or two makers, might be universally adopted. Within the last two years I have encountered twenty or thirty cases of inexperienced amateurs in trouble for want of such help, sometimes in big competitions, sometimes in private tours; and in three cases I have found riders baffled by failure on hills ascribable simply to home-timing of the magneto.

My Tyre Plans for 1912.

My tyre luck has been dead out for several years past, but I have learned a great deal, and readers may be interested to know how I hope to dodge the puncture bogey in 1912. My touring mount will be shod with two of the heaviest and most expensive covers money can buy; they will only be 2¼in., because it is quite possible to hav a thick tyre without having a broad tyre. They will be non-skids of the rubber pattern, devoid of steel studs; nothing gives quite as high a security factor as steel on the worst type of grease, but steel studs strain the fabric casing, and can induce side-slips on smooth stone or wooden surfaces.

Inside the covers I shall not have butt-enders, because once last year I got a huge nail through the butt, and had a rare job to mend it. I shall start with endless tubes, in the hope that they will go through the year unpunctured: if I have to cut one of them out some fine day, I can easily have it butted during repairs.

The tubes will be filled with Firmax. I have not found this compound provide any special safeguard in the event of a really big puncture, but on several occasions it has proved a real boon. Once last year I ran over a packet of pins (or so Sherlock Holmes inferred from the state of my tyres), and yet the tube held up fairly hard for six hours at least. Such a mishap in pouring rain, without the help of Firmax, would break the stoutest heart, if no spare tube were available. A front wheel stand, and a quickly detachable back wheel, with the brake outside the periphery of the belt rim, complete my provision. For repairs I shall carry a modern repair outfit, provided with the best tyre repairing solution, and a Dunlop patch-presser—the last is one of the neatest accessories that has gladdened my cynical heart for years.

"Ixion" recently suggested a light shell body as a protection from the elements. An admirer of "Ixion's" notes has put the suggestion on paper, but it cannot be termed elegant.

Cost of Running a Motor Cycle.

Further Selection of Replies to a Reader's Query.

See also pages 1197, 1247, 1318A, 1357, 1380, 1422 (1911), 5, 64, 131 (1912).

Sir,—I have always kept an account of every item that my motor cycling has cost me, I have just turned it up, and find the following results—perhaps they will interest your readers.

Total cost of everything, including insurance (three years only, third party, fire, and theft), A.C.U. fee, oil, petrol, repairs, renewals, tyres, and licences:

				3¼ H.P. REX.				
				Miles run.				
1906	£14	8	7*	1,580	Machine cost..	£14	0	0
1907	2	2	4	735	Sold for ...	12	0	0
				3½ H.P. TRIUMPH.				
1908	£6	10	0	1,882	Machine cost..	£26	10	0
1909	6	13	8	1,711	Sold for ...	20	0	0
1910	4	8	6	1,125				
1911	4	3	6	425	Years 4)	£6	10	0
Tl. for 6 yrs.)	£38	6	7	6)7,458		£1	12	6
Per year	£6	7	9	1,243				

*A great deal had to be spent to put machine in up-to-date order.

The cost of extras, which other contributors seem to make a great point of, will perhaps be a startler, as the only cost I have to record is—

Burberry motor cycle coat	£3	3	0
Hat		3	11
Ditto		3	11
Leggings, one pair overalls, etc ...	1	3	6
Gloves (three pairs)		10	0
Breeches	1	6	2
Goggles, etc., are included in renewals.			
Years 6 ... ...)£6	10	6	
Per year £1	1	9	
Against this I saved in railway fare for the six years ... ... Years 6)£11	6	9	
Average £1	17	9	

W.V.P.

Sir,—I set up a motor cycle last March, and thought perhaps particulars of the first eleven months' running expenses might be of interest to some of your readers. They are as follows:

Licences	£1	5	0
Insurance and A.A. subscription	3	11	0
Two sets of overalls	3	17	0
New inner tubes	1	6	6
New outer covers	4	2	9
Lamps	1	17	0
Sundry repairs	2	6	5
New valve		4	6
Valve extractor		1	9
Lubricating oil		6	3
Punctures and patches		4	4
Goggles		3	6
Carbide		1	0
Petrol	2	7	7
Total £21	14	7	

My first machine was a second-hand 3½ h.p. Triumph, which cost me £45. In June I exchanged it for another make, and again disposed of the latter for a 1911 Triumph model, paying an additional £17, so that the total cost of my machine was £62. Nothing has been allowed for depreciation. (Rev.) J. A. ROSS.

Sir,—I have now been a reader of your valuable paper for several years, and have read with great interest the columns headed "Cost of Running a Motor Cycle" by various people. I have for the past four years kept strict records of the upkeep of my 3½ h.p. machine, and I think you will agree with me, on looking through my figures, that they form a very fair basis from which any individual rider may calculate for himself the approximate cost of running his machine.

	No. of miles.	Cost. £	s.	d.	Pence per mile.
Depreciation (in market value) after riding same machine for four years (when average mileage =5,000 miles per annum)	20,000	30	0	0	.36
One gallon of petrol ...	90		1	3	.16
Back cover (Dunlop studded)	3,500	2	0	0	.13
Interest on outlay of £30 at 5%	5,000	2	10	0	.12
Renewals and upkeep ...	20,000	5	0	0	.07
Belt (Stanley Dermatine)	3,000		16	0	.05
Front cover (Dunlop studded)	8,000	2	0	0	.06
One quart of lubricating oil	300		1	6	.06
Licences (when average mileage=5,000 miles per annum)	5,000	1	5	0	.05
Insurance (third party claims only, value £50)	5,000		10	0	.02
Back tube (Dunlop) ...	6,000		10	0	.02
Front tube (Dunlop) ...	12,000		10	0	.01
Total cost per mile = 1.13d.					

The rate per mile is taken from average length of life of various parts, observed over a period of four years, with a yearly average of 5,000 miles.

R. S. GREENHALGH.

Sir,—I have read the recent letters on running costs, and perhaps my experience with a 5-6 h.p. four-cylinder F.N. may be of interest.

I notice the majority of letters deal with the first 5,000 or 10,000 miles—a season's run—which, in my opinion, gives a wrong impression to the average motor cyclist.

Early in 1910 I purchased a second-hand 1909 4½ h.p. four-cylinder F.N. I had the 4½ h.p. cylinders replaced by the 5-6 h.p. size. The machine had been run about 5,000 miles. During the past two seasons I have covered a distance of over 15,000 miles, making a total of 20,000 miles.

Oil consumption.—I am a pretty heavy hand with the oil pump, seldom getting more than 200 miles per gallon.

Wear and tear.—Although my machine has covered 20,000 miles, the compression is quite as good, the petrol consumption is equal, and the machine certainly climbs better than it did for the first 10,000 miles. I replace all the inlet valve springs every 1,000 miles to get equal tension. This is the one weak point of the F.N. These springs only cost 1d. each, however. I have also replaced one or two parts of the spring forks.

Transmission.—This is the best point of the F.N. Although it has run over 20,000 miles, and been subjected to rough usage, it has not cost me a penny for repairs. I have adjusted it about three times—a five minutes' job.

A replacement I had to make was from a most unusual cause, due in the main to my own carelessness. This was stripping of the timing wheels and breaking the magneto-shaft. This originated with the magneto cover falling down at one end, and as the F.N. magneto is upside down compared with the usual, it allowed the road grit to enter the interior of the magneto.

Tyres.—My average mileage for the back tyre is 3,000.

BILL O' JACKS.

[With the above letters we bring this series to a conclusion. There can now be no doubt existing in the minds of prospective riders as to the low cost of running a motor cycle, and, as the replies prove, cost largely depends upon the personal inclinations of the rider.—ED.]

THE MIDLAND RELIABILITY TRIAL.

BY A COMPETITOR.

THE scene at the Gun Barrels on the Bristol Road at nine o'clock on the morning of the 17th looked to the casual observer a *mêlée* of motor cycles and weirdly clad figures with numbers round their waists.

To the competitors it was different, and arriving a little before nine o'clock I soon had my numbers fixed and the official time on my wrist.

After a little confusion we lined up, and punctually to the tick got away easily. The styles of getting away were many and various, some had handle starters, some kick starters, and these could be subdivided into those that worked and those that didn't; others had to run, some a few feet, some a few yards; others got off easier, as, for instance, the Levis riders, who merely sat on and prodded the ground with their feet, and at once the little two-stroke went off with a roar. Tramlines to the top of Selly Oak were not appreciated, and it was soon evident that riders of insufficiently guarded machines were in for a mud bath. Rose Hill claimed some victims, and there was a little knot of spectators on the steep bit. We created quite a sensation in Bromsgrove, as, indeed, we did all along the route, for the entry was large, and the procession of motor bicycles must have seemed unending to the various spectators.

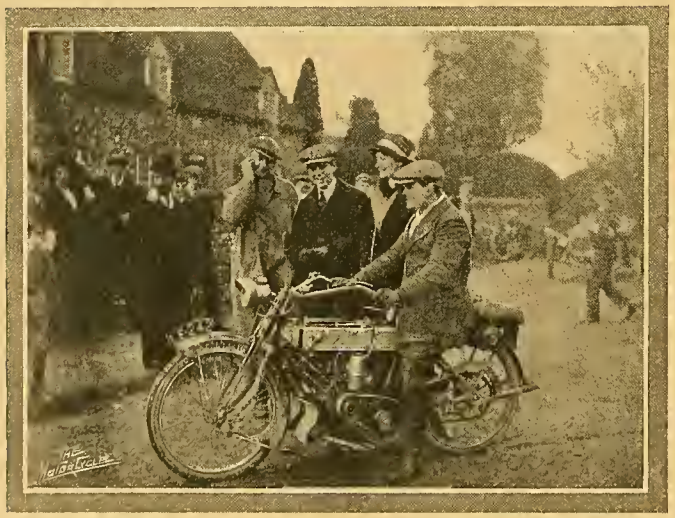
Steadiness in the Grease.

Soon after leaving Bromsgrove one of the Morgans was seen in trouble with tyres, the roads were in a shocking condition after the hard frosts of the previous week, and I was much surprised at the steadiness of the Morgans on the grease. Most of the solos and some of the sidecars were far from comfortable, skating all over the road, the steadiest machines being the twin lightweights. Soon after Stratford one or two unfortunates were passed ruefully examining tyres, due doubtless to the occasional patches of unrolled stones.

Sunrising claimed its usual complement of failures, but the New Hudson and sidecar made a fine climb, although apparently geared low. McNab nearly succeeded in getting his tiny Levis up, but the last few yards made it necessary for him to run, a voice from the crowd urging him to get something more powerful. Warmington Hill proved easier, the surface was slightly better, but it was said that the officials were a mile or more out in their calculations of the distance. Banbury folks should by now be getting used to long streams of motor cyclists, but their interest was still unabated. Some few men retired here, and one or two late arrivals came in for a little chaff. Petrol was taken in, and one of the garage attendants tried hard to persuade me that he had put a gallon and a half into a tank that just held a gallon. He tried in vain.

Homeward Bound.

Starting back, we found the road a bit drier, but Edge Hill was very greasy, and the sidecar drivers had to get their passengers to bear down on the back wheel—a matter for



(1) General view at the foot of Warmington Hill. (2) Competitors approaching Edge Hill, C. R. Collier (Matchless) leading. (3) H. C. Newman (Ivy-Precision) at the hairpin bend on Sunrising. (4) The last knock. A failure on Sunrising. (5) A Triumph rider makes a good ascent of Edge Hill.

The Midland Reliability Trial.—

disqualification if rules were adhered to. The Rex, Douglas, and Triumph machines came up well. Holloway, on a single-geared Premier, also shone conspicuously, but the sidecars did not perform as well as they might have done, the Calthorpe and the A.J.S. suffering from slipping clutches. Slipping belts fetched several out of the saddles, and a slipped gear lever momentarily stopped Miss Hough. Between Sunrising and Stratford it was evident that some making up of lost time was taking place: the riders were thinking of that secret check in the last section. Belt trouble was very small considering the awful state of the roads, but one thing struck me—the chain-driven sidecars were more susceptible to back wheel slip on hills than the belt-driven type. A.G.D.C.

Another Meeting at Arms Hill.

ANOTHER party of London motor cyclists met last week and journeyed down to Henley to attack Arms Hill. The roads were in a terrible condition, almost every rider skidding. On arriving at the hill the writer was surprised to find so many local non-motor cyclists and riders from quite distant parts; the last-mentioned had been there all the morning, and many claimed to have made an ascent. The surface was undoubtedly worse than on the previous week-end, as two men failed on this occasion who managed to get up last week. These were O. K. Meredith (6 h.p. Zenith) and C. W. Meredith (3½ h.p. Bradbury N.S.U. two-speed). The star performance was undoubtedly made by G. Griffiths, who literally tore up on the 8 h.p. Zenith belonging to W. L. T. Rhys. The owner tried first but skidded; he then invited Griffiths to try. Seeing the last-named made such a fine performance Rhys was determined to equal it, which he did in no uncertain manner. It was a sight not to be missed to see these two in turn bring the Zenith roaring up the steep ascent, annihilating the 1 in 3 as if it were a mere nothing. The rear tyre was a rubber and steel-studded Shamrock-Excelsior, and the engine was fed from a Binks carburetter.

Rex G. Mundy astride the 3½ h.p. P. and M., on which he gained third place in the Midland open reliability trial. The photograph was taken at the foot of Arms Hill, near Henley-on-Thames.

On the first attempt Hal Foote, 8 h.p. o.h.v. T.T. Bat, who the previous week had made such a fine show, skidded, but after returning to the hill foot subsequently managed to reach the top at a terrific pace. To get down again is usually a very exciting business, but Foote decided to ride down, and on the 1 in 3 lost control of his machine and absolutely tore down over the grease, all looking on and expecting every moment that he would have a bad smash at the bottom. He, however, managed to regain control of the big Bat and pulled up safely.

A Machine Runs Amok.

The most exciting incident was when a rider came up on a Bradbury, skidded completely round, fell off, his machine running down the hill minus its rider, and continuing without falling for thirty yards or so, when it took the bank, bending the handle-bars and footrests. Vernon Taylor, on a multi-speed Rudge, had ridden from Coventry to try the hill. He was unable to get his rear wheel to grip on the 1 in 3 pitch and skidded badly at each attempt. W. H. Davey would in all probability have reached the top on his T.T. Bradbury had not the magneto chain come off on each occasion. A splendid performance was made by N. D. Slatter on his 2 h.p. record breaking Akyon fitted with a Cap carburetter. He came up at a rattling pace, but rider and machine being so light he was unable to hold up on the grease. He, however, managed to get well above the "Cannons," which was marvellous considering the size of his engine, namely, 62 × 82 mm., only 247 c.c. Slatter is determined to get up. G. N. Higgs, who arrived on his "A.C.," "Peter the Painter," asked a man present to get some sand and ashes to strew on the steep pitch. This made things much easier, but at the same time it was impossible to get up without a non-skid tyre; steel studs for preference.

A Single-geared Machine Succeeds.

Shaw, a T.T. Rudge rider, made a splendid performance. His machine has Dunlop non-skid tyres and a Senspray carburetter. He had made an ascent on a 6¾ to 1 gear when the writer arrived, but he continued to go up after raising his gear ratio. This he did until 6 to 1 was reached, when he still flew up. H. Garner (8 h.p. Zenith sidecar) tried with a passenger up but failed. He then tried solo when his belt broke, winding itself all round the frame. Later he tried again, but his rear wheel, which was rubber-studded, whizzed round on the steep pitch without the machine making headway. Rex Mundy tried on a 3½ h.p. P. and M., but failed solely through the rear wheel refusing to grip. A Kempshall on the back was considerably worn, so much, in fact, that the non-skidding properties of the tread had disappeared. R. Fletcher and C. O. Roberts claimed to have been up mounted on a 3½ h.p. three-speed Premier and a 3½ h.p. three-speed Rover respectively. The greasy state of the hill undoubtedly helped riders in a way, as it enabled them to keep up their engine speed on the really stiff part.

NON-STOP RUNS

are often spoilt by the use of inferior tyres. There can be no better example of the false economy of fitting cheap tyres than that shown by the number of motor cycles that are put out of the running in competitions from this cause.

In the SUTTON COLDFIELD A.C.'s OPEN RELIABILITY TRIAL, Mr. Frank Smith (5-6 h.p. Clyno and sidecar) made quite certain on this point by fitting his machine with

PALMER TYRES

the result being that he WON THE HIGHEST AWARD. the

COLMORE CUP

AND

GOLD MEDAL

AGAINST 102 OTHER COMPETITORS.

"PERFECT IN EVERY PART."

B.S.A. MOTOR BICYCLES

Riders' Testimony.

"Every man's experience is a lesson due to all."

The machine runs fine, and I have nothing but praise for it. The sweetness of running and flexibility is wonderful.

F. PENNINGTON, Bradford.

I have now completed 3,600 miles on my B.S.A. Motor Cycle, 2,200 of which was with sidecar attached, and have not had a minute's trouble or anxiety with regard to it.

Mr. C. H. BAYLISS, Gravelly Hill.

I wish to congratulate you on the excellence of the B.S.A. Motor Bicycle.

B. D., Edgbaston.

I consider your machine a perfect touring machine in every respect, and can safely state there is not a better machine on the road.

P. F. SCOTT, Urmston.

MIDLAND OPEN RELIABILITY TRIAL.

MR. B. W. LEE, riding a 3½ h.p. B.S.A. in the above Trial, in connection with the Sutton Coldfield A.C., over a difficult and hilly course with muddy roads, made a

NON-STOP,

and gained

FULL MARKS.

I think the B.S.A. one of the best mounts anyone can purchase.

Mr. H. TICKELL, Wigton.

Allow me to compliment you on the reliability of your machines.

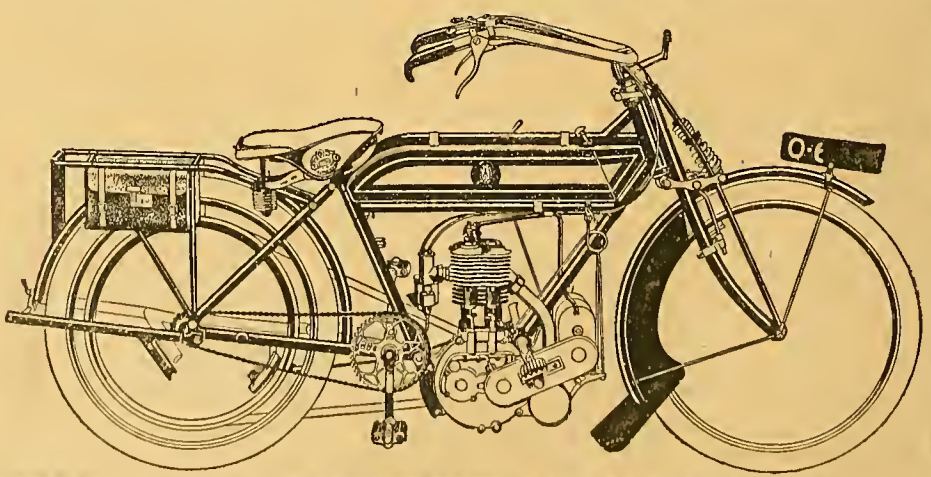
Mr. G. H. WILKINSON, Leicester.

In fact, the B.S.A. is the finest 3½ h.p. Motor Bicycle I have ever ridden.

Mr. A. G. N. CHALMERS, Lyme Regis.

I am more than satisfied with the machine, which is the best I have ever had for speed, hill-climbing, and flexibility.

Mr. F. C. WAKE, Darlington.



I have nothing but praise for the machine, which I consider one of the best mounts on the market.

Mr. W. JACKSON, Ashton-on-Ribble.

Write now for a copy of the new book of the B.S.A. Motor Bicycle.

It fully describes the new models, with illustrations of the exclusive B.S.A. Refinements. The constructional details of the B.S.A. Two-speed Free Engine Hub are also dealt with in simple language.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Silence and Silencers.

Sir,—The Scott Engineering Co., Ltd., claim that the silencer described by Mr. Gallanday, and illustrated in your issue of February 8th, infringes their patent of 1904.

I made (and sold) a silencer of identical construction about 1902. This silencer was copied from the Oldsmobile —an American car much in favour about that time.

L.H.

Silencers in the Big Trials.

Sir,—What a pity it is that correspondents like "Nightbird" should make such positive assertions which are not facts. Whilst criticising the type of silencer consisting of a barrel with holes in it and an auxiliary barrel inside, he says that it is "a device which, at its best, can only be an efficient silencer and cause back pressure, or be free and noisy." Can "Nightbird" explain why one of the best motor cycle engines ever made—the 2¾ h.p. De Dion—when fitted with the De Dion silencer, which was of exactly the type described and one of the quietest silencers ever fitted to a motor cycle, would give more power with silencer fitted than with the exhaust pipe and silencer completely disconnected. This is no fairy tale, and I am sure that there are hundreds of motor cyclists who would bear me out in stating a fact which I have myself proved time and again.

H. J. DENSHAM.

Suggested Routes for the Six Days' Trials.

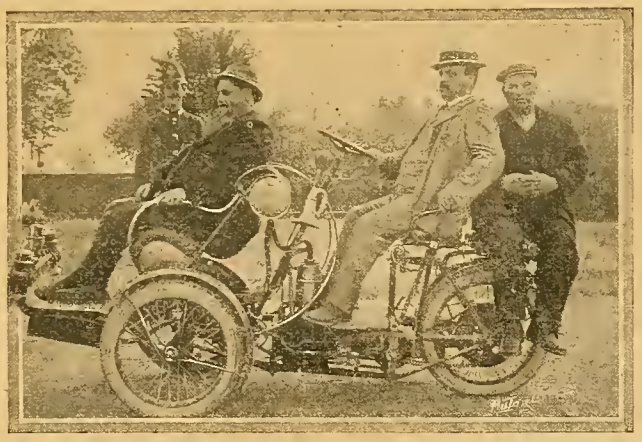
Sir,—I see in your issue of February 15th a route suggested for the Six Days' Trials. Another good route is Tavistock, Horrabridge, Huckworthy Bridge, Walkhampton, up Peak Hill, through Princetown, then to Two Bridges and on to Ashburton by the same route as suggested. The hill down to Huckworthy Bridge would try the brakes very well, and from the bridge to the top of Peak Hill is one continuous climb, the hills being much steeper than those between Tavistock and Two Bridges. The road between Huckworthy and Walkhampton is bad, but the remainder has a very good surface.

T 1189.

Sir,—I was glad to read "H.P.B.'s" letter *re* above in the issue of the 15th inst. The route Ashburton to Tavistock ought to be included. While not being too bad a surface, the hills are all one wants on a main road to make a most sporting and interesting run, and, without leaving the road, there are plenty of hills between Ashburton and Tavistock that would serve as observed or test hills. The spot "H.P.B." marks A (if it is the one I have in mind) should give some trouble. It is not usually approached at speed, as the rider has just rounded a hairpin bend, with a narrow humped bridge in the angle before meeting it. In a very little while after he is confronted with a gate right across the road. When five or six yards from the gate he will notice (mostly when too late) that the road turns back sharply to the right at a very acute angle. I don't suppose one in twelve single-geared machines will round it without a stop, the rise being sudden and commencing at the corner. The last time I rode over this route (last summer) the surface, except Poundgate Hill, was very fair, much of it good. I was riding a 2¾ h.p. chain-driven Enfield, geared 6⅞ to 1, which took all the hills comfortably without pedal assistance. A party of us were holding a hill-climb up the steepest side of Dartmeet Hill, which, however, is descended in the suggested route.

Widdicombe Hill is a very puzzling hill, having some difficult corners and being very narrow; but I am afraid it is rather out of the way. Our club men here think that on no account should the Ashburton to Tavistock route be excluded from one of the runs. Ashburton to Dartmeet is considered by some to be the worst six miles in England for gradients.

A. POWELL,
Hon. Sec. Torbay and District M.C.C.



Driving in Traffic.

Sir,—May I be allowed to correct "Ixion" about his ideas of a car being more easily handled than a motor cycle in traffic? I have tried it, and found it was not the case. I successfully drove my free engine Triumph from Shepherd's Bush to the Metropole Hotel without the slightest difficulty. Although there were several traffic blocks, I started each time as quickly as the car in front of me, and very often was able to accelerate and slip through openings which no car could have gone through. I kept my cut-out closed, and only had to sound my horn once when I was going to start again after a block. By using one's cut-out in traffic a rider makes himself an infernal nuisance, and if it is done it is no wonder the "man in the street" calls motor cycles "beastly noisy affairs." The first thing motor cyclists must do if they want to make the motor cycle popular is to convince the non-motoring public that their machines are not noisy. I think that this regulation about no cut-outs has been brought forward to a great extent through motor drivers using their cut-outs in traffic. Let "Ixion" use a free engine in traffic, and he will find driving a motor cycle as simple as a car. Also, if he has a really quiet machine, he will find that he will draw more attention and approval than by keeping his cut-out open.

FREE ENGINE.

A Heavy Trio.

Sir,—I am sending you a photograph of my 6½ h.p. New Century tricar, Aster engine, chain drive. My passenger on the forecar is my old friend Mr. A. Briggs, manager of the Grand Junction Arms, Lower Place, Harlesden, a well-known

A load of 51 stones 12 lbs. on a tricar.

sculler of 17 stones weight. I am at the wheel—heavyweight champion sculler of the Old Chums Rowing Club on the Grand Junction Canal, weight 16 stones. My son is seated on the carrier; his age is nineteen years, weight 18 stones 12 lbs.—total, 51 stones 12 lbs.

FRED WILES.

Multi-pole Sparking Plugs.

Sir,—In reference to Mr. Arthur E. Bennett's letter, writing for the Bosch Magneto Co., on this subject, the fact that it is necessary to place the points of both plugs very close together for starting does not constitute an admission "that the magneto is not capable of doing the work imposed upon it," as he states, but I do admit that the spark cannot jump two gaps of .5 mm. each when the magneto is running at the minimum speed that will give a spark across one gap of this measurement, so the remedy is to reduce the two gaps to .25 mm. each.

I believe every magneto is provided with a safety gap, and if the current will easily jump the points of a double pole and single pole plugs in preference to this gap, I do not see how the magneto can sustain damage.

The Bosch Co. can now supply a two spark magneto, but those who wish to try two sparks and are not particularly anxious to replace their present single spark instrument by purchasing one of these may do so by the use of a Lodge double pole plug without fear of damage; at least, this is my experience with both Simms and Bosch magnetos, and users' experiences are what Lodge Bros. asked for.

There must be some hundreds of these double pole plugs in use, but I have never yet heard of a single case of bad effect.

I am disinterested, other than as a user in this discussion.

W. J. LANCASTER.

[The above letter has been unavoidably held over.—ED.]

Sir,—With reference to Messrs. Lodge Bros.' letter and diagrams published on the 15th inst., and their statement that the two circuits are practically the same, I should like to point out that there is a great difference in these circuits, and one that bears directly on the argument. In the double-pole plug circuit the two spark gaps are in series, requiring a higher potential difference than in the double-pole magneto circuit. It follows, therefore, that the magneto armature is working at a higher potential supplying two plugs in series, and has more risk of breaking down. It does not necessarily follow that it will do so, this depending on the factor of safety allowed in the design of the magneto.

CLIFFORD PRESSLAND.

Sir,—In the construction of their magnetos, the Bosch Co., knowing what resistances the machines will normally have to overcome, will have designed them for this value, allowing, of course, some factor of safety.

That they are capable of overcoming high resistances, if necessary, shows the caution the makers have exercised, and they are, without doubt, justified in demurring when their machines are habitually run under these higher resistances.

So far as I can see, the Lodge system possesses one advantage over the Bosch, namely, that with two plugs in series the chance of total stoppage through sooting is decreased. In the Bosch, which, I presume, is two plugs in parallel, the chances of stoppage through sooting would be slightly increased.

A. T. STURGESS.

Sir,—I have read with much interest and no little amusement the correspondence on the above subject. There seems to be an idea prevalent among many of your correspondents that using multi-pole ignition increases the load on a magneto. It may interest Mr. Withers, who found that his magneto did not overheat when using Lodge ignition, and also several other correspondents, to know that two, or even a dozen, plugs, sparking in series, do not in any way increase the load on the magneto. The strain set up is not a mechanical one, but is purely an electrical strain on the insulation of the secondary windings. The reason of this strain is fairly obvious; it takes a much greater voltage to spark through several gaps of a given size in series than it does to spark through one of those gaps. This increase in voltage is not directly proportional to the increase in the spark gap, but is nearly so.

A magneto only absorbs power when the contact breaker is closed, *i.e.*, when it is not sparking. This load is due to the fact that when the contact breaker is closed it short circuits the armature windings, allowing a heavy current to circulate round these windings, this load being entirely independent of the number of plugs or the length of spark gap in the secondary windings.

I fully endorse Messrs. Lodge Bros.' remarks. No damage can possibly be done to any magneto by the use of their excellent double-pole plugs, provided the magneto be fitted, as all good magnetos are, with a properly-designed safety gap. The safety gap is, of course, adjusted to flash over before the secondary voltage can rise to a maximum sufficient to break down the insulation of the secondary windings.

ED. C. JENNINGS.

Sir,—We notice that Messrs. Lodge Bros. are again writing on the question of two point ignition, and we do not wish to continue this correspondence any further, having demonstrated to our own as well as many other peoples' satisfaction that a special magneto is necessary.

Under these circumstances, we wish to ask what is the use of Messrs. Lodge Bros. encouraging people to abuse goods of our manufacture. Surely we, as manufacturers of such apparatus, should know what it is capable of, and what treatment is likely to be detrimental to it. . . . . .

The diagrams sent you by Messrs. Lodge Bros. and Co. and published on page 169 are most misleading, as they do not point out that in the case of the ordinary magneto, two gaps are being used under compression, whereas the magneto is only designed to satisfactorily operate one; in the case of the double pole magneto, the construction of this machine is modified to do the additional work.

We hope that you can find room to insert this letter, and sincerely trust that we shall not have to write further on this subject.

THE BOSCH MAGNETO CO., LTD.
ARTHUR E. BENNETT, Technical Manager.

Proposed R.A.C. "Road Guides."

Sir,—Will you be good enough to say whether the scheme of R.A.C. road guides, referred to in the last issue, has been officially adopted? So far as I can see it is rather a bad plagiarism upon the Automobile Association scheme of scouts, and in that case it does not appeal to me as sportsmanlike, to say the least. Surely there is no real need for the R.A.C. to encroach upon the field in which a purely road organisation like the A.A. has operated with such distinguished success for many years. I suggest that this is undesirable rivalry that must lead inevitably to overlapping, friction, and waste of force and money, and that is not for the good of motorists generally.

REIGATE HILL.

[The scheme has not, so far as we are aware, been officially adopted, but is under consideration by the R.A.C.—ED.]

Sir,—I observe in your last issue a letter from the Secretary of the Royal Automobile Club in connection with the proposed scheme, the details of which have been published, for the employment by them of uniformed "Road Guides."

That letter admits that the scheme is a deliberate copy of the road patrol system of the A.A. and M.U. The Secretary of the R.A.C., after referring to the fact that this Association has four years past rendered certain assistance to its members on the road, adds:

> "The members and associates of the R.A.C., amounting to over 25,000, have asked that similar assistance should be rendered to them by their own organisation, and this assistance it is now proposed to give,"

It will therefore be seen that beyond question the duties which the proposed R.A.C. "Road Guides" are to perform will in effect be identical with the duties performed by the patrols of this Association.

I would like to draw the attention of motorists through the medium of your columns to the following salient facts:

The Club has, we believe, about 7,000 direct members, of which number over 4,000 also belong to the A.A. and M.U. In addition thousands of the Club's associates (approximately over fifty per cent.) also subscribe to this Association, and therefore the value of the argument that the scheme is the outcome of a demand on the part of 25,000 members of the R.A.C. is materially reduced, and one is driven to the conclusion that the action of the R.A.C. is devised solely to counteract the phenomenal success of this Association's road scheme. The Secretary of the R.A.C. states that:

> "The Club does not propose in any way to interfere with the A.A. and its members, and sees no reason why the A.A. should interfere between the Club and its members."

I think your readers will agree that a more cynical attempt to justify what may fittingly be described as deliberate

piracy of ideas has never been put forward on behalf of a responsible organisation.

The Automobile Association was founded seven years ago with the chief object of organising a patrol service to render assistance to motorists on the road.

This was the first practical attempt ever made to combat the oppressive and unfair manner in which the speed limit was enforced on the open road. For years we fought single-handed the battle of the reasonable motorist, without assistance from the R.A.C. and other organisations, which stood idly by, and if they did not hamper our efforts at least did not assist us.

The patrol organisation has always been regarded as essentially the leading feature of the Association's work, and its popularity is evidenced by the fact that the membership has grown from less than 100 in August, 1905, to a total at the present time of nearly 40,000 direct subscribers.

Now at the fruition of our efforts, and when the battle of the open road has been fought and won, the R.A.C. proposes to imitate our patrol system.

Our organisation is in evidence on practically the whole of the main roads of this country. Unless, therefore, the R.A.C. intends to confine its efforts to those roads which are not patrolled (which in the circumstances is incredible) its action, even as regards its own members, can only involve overlapping and duplication of that work which for so long has been efficiently carried out by this Association.

My committee still think it inconceivable that the R.A.C., which claims to be the ruling body of motoring in this country, will deliberately adopt a policy which has already been described as one of aggression to a friendly organisation, particularly at a time like the present, when unity is so essential in the interests of the motoring public.

STENSON COOKE.

Sir,—"Uniformed Road Guides" has an ancient and scout-like atmosphere. What the R.A.C. did in the matter of free legal defence it seems to be going to do in the matter of road patrol—both in palpable imitation of the A.A. Apart from the fact that this is not cricket, I suggest that it is not dignified. Certainly the A.A. has no copyright in its ideas, but as between two bodies presumably friendly, and certainly working for a common end, I should have thought that the annexation of one of the planks in the other's programme, without so much as a "by your leave," was almost unthinkable.

I do not suppose the A.A. will take this last act of aggression from the R.A.C. lying down, and if the latter persists with its development (doubtless in the sacred name of unity), I suggest quite seriously that the A.A. challenge the R.A.C.'s right to govern. The A.A. is quite as responsible a body as the R.A.C., and certainly quite as free from trade influences. Its certificates of observed performances would carry as much weight as the R.A.C. certificate. It can organise trials as easily, and perhaps carry them through better, and, by right of enormously superior membership, it can assume the powers of government and demand representation upon the International Council. If I know the International Council as I think I do, the credentials of the A.A. should be accepted readily.

I submit that as one way in which the A.A. might answer this last act of R.A.C. piracy—a way mutually better and infinitely more satisfactory than any likely to lead to an expensive and entirely unnecessary internecine struggle—is for both sides to get together and decide upon a policy that will allow each to develop freely and without conflict with the other's interests. Short of complete unity, this form of federation, quite easily possible, is, I venture to think, best.

PLAY THE GAME.

Hill-climbing.

Sir,—Upon reading the correspondence appearing in your paper respecting the proposed attempt to climb Honister Pass by Mr. Frank Smith on his Clyno and sidecar, I got into communication with the Clyno Engineering Co. and offered my club's assistance in organising the climb.

I have had a reply to the effect that they would be very pleased to leave the arrangements in our hands, and with this object in view they tell me that they have definitely decided to arrive on the ground in time to tackle the hill on March 9th, all other arrangements to be left to this club.

WM. M. MILBURN,
Hon. Sec. Cumberland County M.C.C.

Sir,—If you can spare me the space in your paper. I should like to reply to the letter from "Petrolix" in a recent number *re* the climbing of Honister. Whilst admitting that the surface on the Buttermere side of the pass is very loose, I should consider that the hill is climbable by any powerful two-speed motor cycle, and that without in any way damaging either the machine or tyres, as a few members of the Westmorland Motor Cycle Club have spent some considerable time on this part of the earth, and the last time we were there two Rudges and one Triumph single-cylinder machines almost did the trick. In the opinion of these three riders, given a favourable day and conditions, a 3½ h.p. single will manage it comfortably, as there is only one stretch of sixty yards that has not been conquered. With all the trials we have had on the hill, so far, there has been no damage to tyres, machines, or riders, so can only conclude that there is no special danger in trying the pass, and we are quite of opinion that if Mr. Smith will attempt the climb he will be successful, and quite a number of the Westmorland members hope to be there at the same time to give the Clyno a lead.

B.G.W.

The Nominal Horse-power of Motor Cycles.

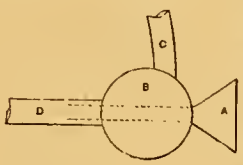
Sir,—Regarding horse-power rating, I found a very simple formula which I have used for ten years in motor construction practice. I found this method always reliable. What do you think about it?

A well-designed motor cycle engine gives one horse-power per 120 cubic centimetres capacity. Now, by dividing the c.c. by 120 you will find the exact horse-power of the motor. Examples:

Peugeot lightweight 55 × 70 twin = $\frac{332 \text{ c.c.}}{120}$ = 2.76 h.p.

Triumph 85 × 88 = $\frac{499 \text{ c.c.}}{120}$ = 4.15 h.p.

F.N. four-cylinder = $\frac{494 \text{ c.c.}}{120}$ = 4.11 h.p.



Matchless 76 × 85 twin = $\frac{776 \text{ c.c.}}{120}$ = 6.46 h.p.

Doubs, France. A. SAUBERLI.

[If our correspondent's method gave accurate results ten years ago, it is obvious that nowadays it will be more correct to divide by 100, as already suggested.—ED.]

Cooling the Exhaust Gases.

Sir,—I herewith enclose a description and drawing of a silencer scavenging device which I am fitting to my T.T. Quadrant.

It consists of an air scoop or funnel, reaching through the silencer into a long exhaust pipe leading to the back stays. The rush of air through the scoop into the long exhaust pipe should effectually induce the gases to leave the silencer more readily, thus reducing back pressure to a minimum. The sketch should make the device quite clear.

H.A.F.

Two-stroke Engines.

Sir,—I was very interested in the article by "W.G.A." on two-stroke engines. I have given this type a lot of consideration, and hope you can allow space for a little criticism.

Your contributor, in comparing two and four-stroke engines, mentions four disadvantages and three advantages. With regard to this, taking the advantages first, No. 1 needs no comment, being fairly obvious. No. 2 says the two-stroke is the more silent owing to there being no noisy valves and valve gear. He evidently forgets that in most motor cycle engines the noise of the exhaust completely drowns the valve noises, and as the two-stroke engine, to work with satisfaction, must have a free exhaust, we can expect, in most cases, a more noisy engine. No. 3 says ease of and cheapness of manufacture. This advantage depends upon from whose point of view the advantage is looked at. If it be the point of view of the motor cyclist it is non-existent, so that we must say this advantage goes to the manufacturer. But the motor cyclist does get the advantage from fewer and larger moving parts, with less liability of breakdown.

Taking the disadvantages. No. 1: Decrease of efficiency owing to shortness of mixture in the cylinder. This is only a matter of design, and in a properly designed engine it is possible to get a better and bigger charge of new gases into the cylinder than with even a four-stroke engine.

No. 2: Inflexibility. This is said to be owing to bad suction on the carburetter with crank case compression. Whilst this has its effect, it is by far a lesser evil. It is well-known and proved that two-stroke engines, with the usual type of piston with a deflector cast on the piston head, allow a lot of the incoming charge to escape through the exhaust ports. This varies from 7% at high to 33% at low speed. The top of the cylinder is left full of burnt gas, and the incoming charge must be rich enough to make an explosive mixture when combined with the burnt gases. This accounts for the inflexibility and excessive petrol consumption. This evil can be entirely overcome in a properly designed engine.

No. 3: Difficulty of keeping the piston gas-tight. As your contributor compared the two-stroke piston with the four-stroke piston, he must refer to leakage past the piston rings. In his case both types are in the same position, and the result is the same—lowered compression and loss of power. The remedy is the same for both types, namely, new rings, and possibly the cylinder reground, etc. But the leakage is greater with the two-stroke under similar conditions, owing to the vacuum in the crank case, and the result is disastrous as far as the suction on the carburetter goes.

No. 4: Burning of the sparking plug points. This is owing to the reason explained under the second disadvantage—the exhaust gases are never completely cleared out, so that the plug points never cool. This can be overcome by suitable design.

Your contributor goes on to say that to give good results as a valve the piston should be tight in the cylinder, under which conditions it would soon fail as a piston. Surely a piston with three rings above the ports will hold the same compression as in a four-cycle engine. If they will not hold the compression, how can they be expected to hold the explosion pressures? This brings out another advantage of the two-stroke. When the rings have passed the ports there are no leaking valves; all leakage must pass the rings, which are cooled and oiled. And a piston with one ring at the bottom will surely hold the crank case compression, which does not, as a rule, go above 20 lbs. per square inch absolute.

With regard to water cooling, I do not consider this necessary when the exhaust gases are got away quickly and completely. F. UMPLEBY.

Inclined Engines.

Sir,—I have read with much interest the reasons given by Mr. Wells in his letter of the 15th inst. for inclining a single-cylinder engine backwards. Mr. Wells states that "all the piston thrust comes on the back of the cylinder," but I fail to see why this should be the case. It is true that the maximum thrust during the working stroke is on the back of the cylinder, but, on the other hand, during the exhaust and compression strokes the thrust is on the front of the cylinder, and this is not so small that it need not be taken into accounnt.

I do not see why the backward inclined cylinder should get more oil on the back than on the front of the cylinder, since the oil is thrown off the flywheels to that side of the cylinder opposite to the direction in which the oil is flung.

To incline the cylinder backwards must surely have the effect of increasing the unevenness of thrust, for in this case most of the weight of the piston itself is resting on the back of the cylinder. This is not the case with a vertical engine.

There is little doubt, I think, that the modern vertical engine receives all the oil it requires at moderate speeds, while at high speeds it is a generally accepted fact that the oil fills the crank case in the form of a mist, so that it would pass through an opening in the top of the crank case, just as readily as through an opening in the side.

If the engine must be inclined for the sake of the valves or the length of the stroke, why not incline it forwards, as in the P. and M. and Motosacoche, and so minimise the inequality of the thrust by allowing the weight of the piston to act on the side of the cylinder which receives the least piston thrust?

I should be obliged if Mr. Wells would explain to me why a backwardly inclined engine should prevent "piston clatter." I am the possessor of a bicycle with a single cylinder vertical engine which has no ring at the bottom of the piston, and should be very much surprised if the engine which Mr. Wells upholds has less "piston clatter" than my own, this noise being absolutely unknown to me.

As regards evenness of piston thrust, wear of cylinder and piston, and cooling, the vertical engine must certainly score over the backward inclined engine. VERTICAL.

Cycle-car Design.

Sir,—Might I give a word of advice to designers and prospective constructors of runabouts? There seems to be an impression about that to build a successful car all you want to do is to design something that looks neat.

Now, I can assure these gentlemen that it is one thing to sketch a runabout and quite another matter to see the same in a materialised form and, at the same time, a success. Of course, I admit it takes very little to please some folks.

Whilst appreciating Mr. Taylor's reference to my name, I do not think it was necessary to couple the same with his design. My friends would not have made that error.

Is the Brooklands race for runabouts a handicap? If so, how are they going to draw the line, as it is ever so much more creditable to attain 40 m.p.h. with a 3½ h.p. engine than 50 m.p.h. with an 8 h.p. HAROLD E. DEW.

Necessity the Mother of Invention.

Sir,—Under the above heading in your issue of 22nd inst., a correspondent relates his method of thawing generators. Would it not have been a more satisfactory plan to start up the engine on the stand, and warm the frozen part at the silencer? J. B. DALL.

Sir,—I was particularly struck by the remarkably cute wrinkle adopted by Dr. Selby Clare, but after reading his letter twice to make sure I quite followed the course of operations, I thought I would like to enquire what simple method Dr. Clare adopts on a hard, nipping, clear, moonlight, frosty night, and when the date of the last snowfall was some time during the previous winter. Personally, I prefer the petrol fire to waiting for a snowstorm.

A. B. BENNETT.

The Evolution of Transmission.

Sir,—I notice in his letter, published on the 18th ult., Dr. Patterson states that after trying gear drive for six months he lost heart in motor cycling. Does it not occur to this gentleman that to get such poor results something must have been radically wrong with his transmission? Probably it was loose, and I admit that a loose gear drive is most unpleasant. I fail to see that a seized engine is dangerous in a rigidly driven machine when fitted with a clutch. I have had an engine jam suddenly while riding a chain-driven machine, but the clutch slipped and brought the machine safely to rest.

I was disappointed not to see more weather-proof transmissions at the Show. The chain-drive people make great claims for their system, but in the weather we have been having lately I found that even my pedalling chain became coated with mud and unreliable. I have not yet seen a machine with adequate protection for its chains.

I have tried three methods of gear drive—(1) Singer, engine in wheel, very violent; (2) F.N., very good; (3) T.A.C., worm drive, the smoothest running machine I have ever been across.

H. E. RENDALL.

SUMMARY OF CORRESPONDENCE.

"Continental Tourist," who is contemplating a long motor cycle trip in Holland, Germany, Switzerland, and Italy, or across France, and by water to the North coast of Africa, wants companions. He writes as follows: "A party introduced through *The Motor Cycle* might meet at Whitsuntide and ride four or five hundred miles in England to gain knowledge of each other's idiosyncrasies, etc. Then, if the party were mutually agreeable, arrangements could be made to start some time in July. Expenses, 10s. per diem; time occupied, about three to four weeks." Letters addressed to "Continental Tourist," c/o the Editor, will be forwarded to the right quarter.

The carrier tricar illustrated on page 207 last week is an Omnium, marketed by the Omnium Motor Co., Ltd., 193, Great Portland Street, W.

An Ingenious Pressure-fed Engine.

WE have seen, owing to the kindness of its designer, Mr. Archibald R. Low (the inventor of the Cup plug), details of a new type of internal combustion engine.

Briefly described, it is practically one of the Diesel type. Imagine a water-cooled engine, the jackets of which are filled with petrol instead of water; then as the engine gets warm, the petrol will boil and produce a large amount of vapour, which will develop considerable

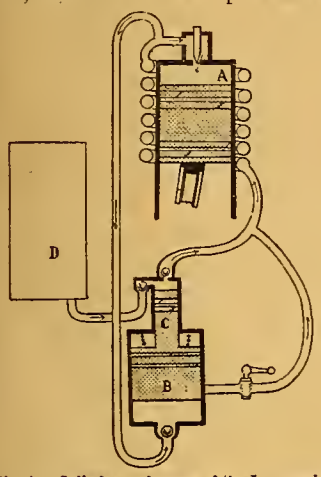


Fig. 1.—Cylinder and pump of the Low engine.

pressure. Now let the engine be fitted with a small valve in the cylinder head, so arranged as to open when the piston is at the top of its compression stroke and allow a certain amount of vapour to enter the cylinder under pressure. The carburetter jet may now be cut out of action, as the engine will work on a cycle of operations, which is as follows: On the suction stroke the piston will draw in through the inlet valve a volume of cold air, which will be duly compressed. At the top of the compression stroke, immediately previous to ignition, a quantity of petrol vapour is injected into the cylinder, mixes with the air already there, and forms an explosive mixture which is fired and exhausted.

Three Important Advantages.

1. The waste heat of the engine is largely regained, as it is utilised to volatilise the petrol before it is injected into the cylinder in the form of vapour.

2. Owing to the fact that only pure air is compressed and the petrol vapour admitted only when the compression is complete, an extremely high compression ratio can be used. Beyond a certain limit, about 150 lbs. to the square inch, a mixture of petrol gas and air cannot be compressed, for the reason that the temperature produced by compression is sufficient to ignite the mixture. When the petrol gas, however, is not mixed with the air until this stroke is complete, the compression may be carried to almost any desired figure, and accordingly results in a very considerable increase of efficiency.

3. The mixture at the moment of firing is, relatively, far from uniform, and consists of a zone of very rich mixture surrounded by a number of zones of mixture, each of which is progressively weaker as it is more distant from the part through which petrol vapour is admitted. The explosion, therefore, as in the case of the Diesel engine, is not a very sudden one, producing an almost instantaneous impact upon the piston, but gives rise to a relatively slow combustion, with the result that the pressure on the piston, instead of falling off rapidly, is maintained longer.

A 416 c.c. Engine giving 18 h.p.

We understand one of these engines has given satisfactory and promising results, a twin-cylinder model of 2in. bore and 4in. stroke having developed about 18 h.p. Unfortunately, we cannot give working drawings, and therefore indicate the arrangement diagrammatically.

A (fig. 1) is the cylinder, provided with an inlet and exhaust valve (not shown); the former is automatic, being inverted and placed over the mechanically-operated exhaust. Wound round the cylinder is a coil of steel tubes, which serves the purpose of a petrol jacket.

Until the engine has developed sufficient heat to vaporise the petrol in this coil, it is run off the carburetter like any other engine, after which the petrol jet is cut out of action and pure air only drawn in through the inlet valve. The vapour, under high pressure from the heating coil, is conducted to a small dome in the cylinder head, in which is contained an inlet valve, which is operated mechanically by a very simple and ingenious means so as to open on the top of the compression stroke and allow a volume of pure petrol vapour to pass into the cylinder head. Furthermore, this valve is arranged to close comparatively slowly, so that the vapour continues to be forced into the cylinder even after ignition has taken place, but it, of course, closes before the explosion pressure has risen very considerably.

The ignition is by coil and battery, the coil being arranged to give a stream of sparks throughout practically the whole of the explosion stroke.

Petrol is supplied from tank D to the vaporising coil by a species of V "Worthington" pump, which works practically automatically and utilises for its working the pressure inside the coil itself.

The pump (not to scale) is shown in fig. 1, and consists of a double trunk piston B C. A connection between that part of the pump cylinder below B and the petrol jacket is provided by means of a non-return ball valve. Between the upper

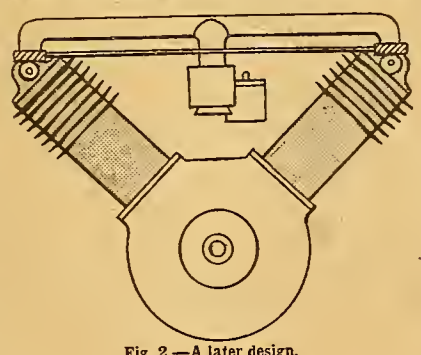

Fig. 2.—A later design.

end of the piston B and the pump cylinder head is a spring, shown in section, against which the gas acts when forcing the piston B and its smaller extension C up in their respective cylinders. An equalising pipe, fitted with a tap, is taken, as shown, from the large cylinder of the pump to the vaporising coil, and when the piston B is at the top of the stroke, forms a continuation, as it were, of the coil circuit. In actual working the piston of the pump, by reason of the

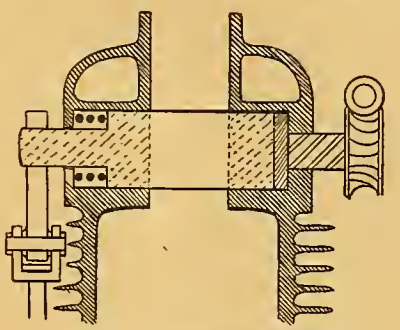

Fig. 3.—Variable cut-off or throttle

spring above it being purposely made a little stronger than would otherwise be necessary, vibrates very rapidly, and finds a position in which it practically floats, all the time feeding petrol to the vaporising coil. It will be seen that if the stop cock at the side of the pump be open no petrol is admitted into the jacket, as the circuit of the coil is closed and the pump remains at the top of its stroke. When, however, this cock is closed, the pump goes on working until the pressure in the coil more than counterbalances the strength of the spring upon the piston B. In intermediate positions of the tap a constant supply of greater or less volume is supplied.

In a newer type of engine which is about to be built, the arrangement shown in fig. 2 is being adopted. Instead of having the vaporising coil wound round the cylinder a steel petrol jacket head is being used which will contain an oscillating cylindrical type of inlet valve operated from a camshaft by rockers, and furnished with a means whereby the cut off of this valve can be varied in unison with the tap on the Worthington pump before mentioned, so that the amount of mixture admitted to the power cylinder can be changed in volume without being affected in quality.

The means for obtaining this variable cut off are shown in fig. 3. The valve, which is rocked to and fro, is traversed by an oblong slot and is closed by being rocked out of register with the inlet port above and below it. In order to throttle the air as it passes to the cylinder through this valve the whole valve can be moved sideways by means of a quick thread drum operated by a worm gear, the horizontal shaft of which actuates the valves of the two cylinders simultaneously.

Whilst it is impossible, with the limited particulars of practical working results which we have had placed before us, to prophesy what the engine will do, its public performances will be looked forward to with exceptional interest.

Belgian Motor Cycle Show.

The Belgian League Vélocipedique have decided to organise an exhibition of motor cycles and accessories in Brussels on December 21st to 29th.

Auto Cycle Union Notes.

ONE-DAY TRIAL JUDGES.—Captain H. E. Davidson, R.E., Captain D. F. Nicholl, R.A., and Mr. C. J. Feeney have been invited to act as judges in the one day trial next Saturday.

PERMITS.—Permits to hold open trials have been granted (subject to the rules being in order) to the following bodies:

Liverpool A.C.C., reliability trial, April 12th.

Oxford M.C.C., hill-climb, April 13th.

Bristol C. and M.C., hill-climb, April 27th.

Coventry and Warwickshire M.C., reliability trial, May 4th.

Birmingham M.C.C., cyclecar reliability trial, May 18th.

Liverpool A.C.C., hill-climb, June 1st.

Liverpool A.C.C., speed trials, July 20th.

Coventry and Warwickshire M.C., hill-climb, August 31st.

Liverpool A.C.C., reliability trial, September 7th.

A cyclecar class will be a feature of the Essex M.C. hill-climb on March 16th.

THE CYCLECAR, FORMERLY KNOWN AS THE QUADCAR, MONOCAR, DUOCAR, OR, IF IT HAD THREE WHEELS, THE TRICAR OR RUNABOUT.—The result of two conferences by the A.C.U. Competitions Committee and the R.A.C. Competitions Committee has been to define what is now to be known as the cyclecar, which was formerly called by all the above titles. The cyclecar, therefore, which is to be under the jurisdiction of the Auto Cycle Union, must be fitted with an engine the cubical capacity of the cylinders of which does not exceed 1,100 c.c., and the chassis weight of which with tyres does not exceed 6 cwts. Where the body and chassis are identical, as is the case with certain of these vehicles, the whole is counted as the chassis, but for purposes of weight the cushions, etc., would not, we take it, be counted. The hybrid, therefore, as a result of this meeting comes out with an official distinctive name and a definition—two things it never had before. It must be noted that no imposition of any kind has been placed on its development, and improvements may be made in the cooling, change-speed gear, transmission, mudguarding, or comfort to any extent, provided the weight or c.c. limits are not exceeded. In competitions for cyclecars, or in which there are classes for these vehicles, the weight complete, but with tanks empty, must not exceed 7 cwts.

Midland Boy Scout Movement.

One of the Coventry and Warwickshire Motor Club's events, to be held at the end of May, is a Boy Scout Manœuvre in which upwards of 250 scouts will be engaged. This event is to replace the Military Reconnaissance which was an interesting and instructive item of the past years' programmes.

Sidecars or Small Cars in the States.

Commenting on the quadcar movement in this country, a leading American motor cycle journal says: "For a couple of seasons, at least, low-built, three-wheeled creatures, not quite in the big motor car class have been trying to butt into the camp of the two-wheeler—to tempt motor cyclists, says one writer, with a cheap imitation of a car. . . In this country it looks like (1) motor cycle, (2) motor cycle with tandem seat, (3) motor cycle occasionally attached to sidecar, for some time to come; for anything bigger, the small regular car."

Motor Cyclists Obtain Damages.

At the Ludlow County Court last week, George Hone, of Shrewsbury, sued Cecil C. Brinton, of Kidderminster, for £75, for personal injury and for damages to a motor cycle caused by a collision between his motor cycle and defendant's motor car on Corve Bridge, Ludlow, on Sunday, June 25th, 1911. After a long hearing the jury found for the plaintiff for £35 14s. 6d., with costs.

Harry Juckes, of Blackburn, sued Constance de Jong, Hoylake, at the Shropshire Assizes, for personal damages and for damages to a motor cycle, caused by the negligence of the defendant or her servants in driving a motor car. Defendant denied negligence, but, on the contrary, said plaintiff was guilty of negligence or contributory negligence, and she counter-claimed for damages to her motor car. After a short consultation, the jury found a verdict in favour of the plaintiff, and judgment was accordingly given for £160 (the agreed amount) on the claim, and verdict and judgment also for Juckes on the counter-claim.

HILL-CLIMB AT MONTANGLAUST, FRANCE.
H. Newey (2½ h.p. two-stroke Lovis) gaining first place in Class 1.

Cyclecar.

The new name adopted by the Auto Cycle Union for light three or four-wheeled runabouts on motor cycle lines.

T.T. Entries.

Undermentioned are further entries received for the T.T. Races, making a total of thirty-eight to date:

SENIOR RACE.—P. Butler, H. R. Fowler (3½ h.p. Norton), V. Wilberforce, N. O. Soresby, and V. Taylor (3½ h.p. Rudge).

JUNIOR RACE.—J. P. Pattison, V. Wilberforce, S. A. M. Witham, and S. Taylor (2¾ h.p. Levis.)

American Records.

According to a cable from Los Angeles, some remarkably fast times were accomplished on the track on Saturday last (February 24th) by W. E. Hasha, of Dollox, Texas, who is the great rival of Jake de Rosier, of Indianapolis. Hasha rode an 8 valve twin-cylinder Indian, and is credited with the following new records: One mile in 39⅘s., two miles in 1m. 19⅘s., three miles in 2m. 1⅗s., and four miles in 2m. 40⅗s.

The M.C.P.A.

Elsewhere in these pages a report appears of the Motor Cyclists' Progressive Association's first meeting. It is a body which has a very laudable object, but from the names it has suggested to represent the private members of the A.C.U. we must say it falls rather short of the mark at which it is to be presumed it is aiming. These names are those of highly estimable men, but it is most unfortunate that seven out of the twelve are actively engaged in the trade, and three more are indirectly interested. We do not for a moment object to trade members serving on committees—in fact, they are welcomed, as one or two can guide the committee and give expert information—but here it is distinctly overdone, and we hope that when the final elections take place on March 7th a committee will be elected in which the private owner element is more strongly emphasised.

Dangerous Road Obstruction.

At 11 p.m. a few nights ago a Norfolk policeman found a horse on the road side which was tethered by a chain to a peg on the other side of the highway. Imagine the fate of any motor cyclist should he have ridden into this chain!

Anotner Road Danger.

A Bristol correspondent, Mr. T. E. Dougal, calls attention to a dangerous cable made of twisted undergrowth which was stretched across the road about on a level with his face whilst in the saddle. This obstruction was met at 6.15 p.m. about 100 yards from the foot of the hill leading to the village of Norton Marleward on the road *viâ* the lanes from Chew Magna (Somerset) to Bristol. The local police are investigating the matter.

A Limousine Body Suggested.

An inventor who has evidently read our articles on streamline bodies, and "Ixion's" suggestions for a similar body as a weather protection, has gone one further. In a letter to Rudge-Whitworth, Ltd., he suggests *with all seriousness* a sort of limousine body for motor cycles made of metal, with side, front, and rear glazed windows. In a sketch the superstructure is shown supported from a framework of rods, and at the base on each side are two small supporting wheels raised about an inch from the ground. In front is a dog catcher. The firm have no intention of adopting the idea.

Birmingham Novices' Trial.

A novices' trial, held by the South Birmingham M.C.C. on the 25th inst., resulted in a win for W. E. Baylis (3½ h.p. Allday), three tying for second place, viz., S. H. Fletcher (3½ h.p Premier), G. F. Norton (3½ h.p. Humber), and E. H. Allday (3½ h.p. Allday). Only seven competitors out of twenty succeeded in climbing Sunrising Hill.

Dissatisfied with English Machines.

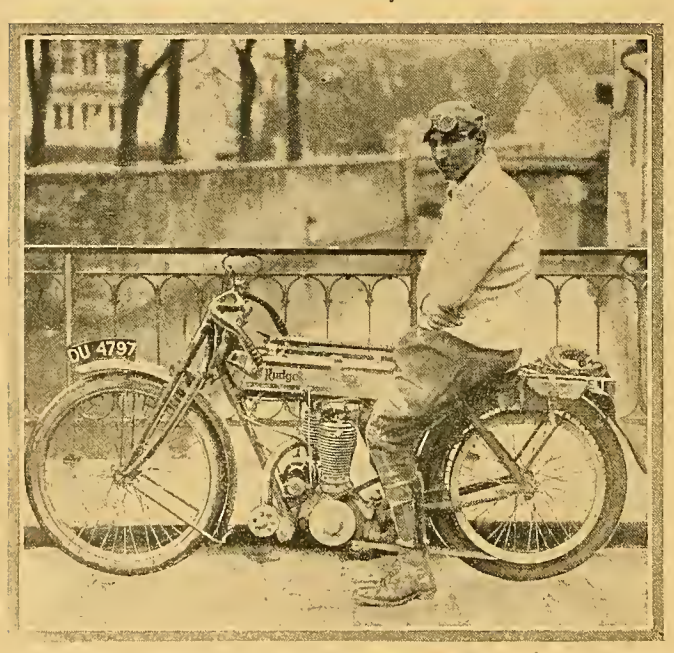
We notice a testimonial published in an American contemporary, and addressed to the makers of the four-cylinder Pierce motor cycle, which reads: "I am now sure I shall stick by your machine instead of investing in a car, as I had intended doing, *failing to find a satisfactory motor cycle in England*, although I tried practically every make.—DONALD B. LARKE, Stoke Holy Cross, Norfolk, England." The italics are ours. Mr. Larke appears to be a difficult man to please.

Lady Rider's Fatal Accident.

We very much regret to report the fatal termination to an accident which occurred on the 11th inst. to Mrs. O'Donovan, the wife of Mr. D. R. O'Donovan, of Bedford. Mrs. O'Donovan was riding her motor bicycle at Cardington Cross, on the outskirts of Bedford, when the machine side-slipped and she fell. Her injuries, which were not thought to be serious at the time, resulted in the unfortunate lady's death on the 21st inst. This is the first fatal accident which has occurred to a lady motor cyclist.

Clean Counties.

At a recent meeting of the Flintshire Police Committee the Chief Constable reported that he had received and tested a number of samples of stop watches which it was suggested should be supplied to the police for timing motorists. In twenty-four hours the watches had all varied though started together.



FRENCH OPEN HILL-CLIMB.

A N.S.U. rider clear of the ground. A goodly crowd collected to see the "jumping" here. Vernon Taylor (T.T. Rudge), winner of two classes. He is clear of the ground at the ridge near the hill summit.

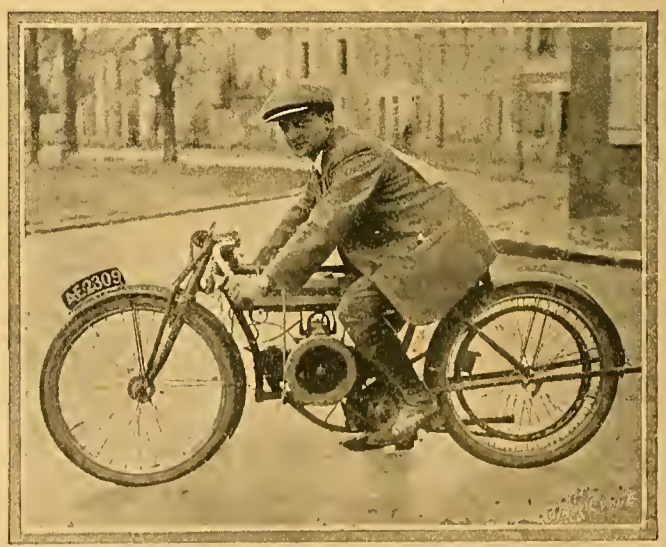
FRENCH OPEN HILL-CLIMB.

LAST Saturday morning an English party of motor cyclists left Charing Cross Station at ten o'clock, their destination being Coulommiers, near Paris. The riders were W. W. Douglas, O. C. Godfrey, E. H. Lees, Vernon Taylor, H. Newey, Harry Reed, Jack Woodhouse, W. F. Newsome, W. G. McMinnies, and R. G. Mundy. A. P. Maurice

Vernon Taylor and his winning Rudge.

(3½ h.p. Premier) failed to put in an appearance; we, however, found him at Coulommiers on arrival there. The journey over was uneventful, excepting a little incident at Longueau in the afternoon, where an axle of the train caught fire, the railway officials being obliged to change a lot of luggage into another truck. At Paris we were met by the officials of the Auto Cycle Club de France and conducted to the other station *en route* for Coulommiers, a little village some thirty-six miles from Paris where the hill-climb was to be held on the morrow. Hal Hill and A. J. Moorhouse, both of whom were included in the party, stayed the night in Paris and came over to see the hill-climb in the morning. After dinner the Englishmen were entertained by the President of the French Club, champagne being very much in evidence. As practising on the hill would be stopped at 9 a.m., most of the competitors retired to bed early so as to be up in good time for some practice spins.

Bad State of the Surface.



The surface of the hill was in a shocking condition, being extremely bumpy and very greasy, especially after gaining the summit of the hill where a straight down hill course was taken. The latter part, where terrific speeds would have been accomplished, was in a very greasy condition, and later it was decided to cut this part out and finish about 130 yards from the summit of the hill. Some of the riders had fitted plain racing covers to their machines. How they wished for non-skids! The competitors were given about 130 yards flying start before being timed. At the top of the hill was a hump, and here, it was estimated, the men jumped ten to twenty feet. Many of the machines had some extraordinary fitments. Canale's little Alcyon was fitted with four overhead valves, one at each "corner" of the cylinder, and sparking plug right in the centre. There were five classes for all types of motor cycles.

The first man despatched was Canale (Alcyon), who got up a good speed but came off at the hump. He later descended to the foot of the hill with his hands bandaged up. However, he rode in the next class, but naturally was much slower.

The N.S.U. riders had an extraordinary way of continually starting up their engines on the stand and running them "all out" for a minute or more on end just before their turn came. Brunet, on a 1¾ h.p. Griffon, had an extremely small pulley with the belt very low in the groove. Nevertheless he found it necessary to pedal up the 1 in 10 gradient. Newey on his two stroke Levis was the first Englishman up, making an excellent ascent and winning his class. Next came W. W. Douglas, who put up a splendid show on his 2¾ h.p. twin, beating Rex G. Mundy, who was placed second on his 2½ h.p. Singer. Although two New Hudsons were entered, only one went up, and it was not fast.

Godfrey's "Star" Turn.

After the two N.S.U.'s, ridden by Gomertz and Robert, came O. C. Godfrey on his 3½ h.p. Indian, who travelled like a rocket. His performance was undoubtedly the star turn of the day. Hitting the hump at quite 40 m.p.h., he shot into the air, and it was estimated that he did not touch the road for twenty feet. When he did so he missed his left foot-rest, his foot touching the ground, causing the spectators to think that he had put his foot out to correct a skid as his machine slid across the road at this minute. He, however, recovered himself in a marvellous way, and succeeded in making fastest time of the day. He was disqualified later on account of his auxiliary ex-

W. W. Douglas (2¾ h.p. Douglas), winner of his class in remarkably fast time.

French Open Hill-climb.—

haust ports. Maurice (Premier) and Harry Reed (Dot) put up fair performances, but Gabriel (clutch Triumph) was poor. Vernon Taylor made an excellent ascent and jumped a long way at the ridge, landing very neatly. E. H. Lees made a fair performance. McMinnies was slow. J. Woodhouse stopped on account of water on his high tension wire. A similar trouble befel Newsome, who found water on his plug terminal. The officials at first agreed to their having another start, but later refused to allow this—very hard luck it was thought after travelling all that distance!

Amateur Events Decided on Formula.

All the preceding classes were decided on time alone, the next class for amateurs being decided on formula. Vernon Taylor again made a fine ascent on his T.T. Rudge, gaining first place. In this class McMinnies failed on account of mud getting into the carburetter

A Bedelia competing in the hill-climb at Montanglaust.

needle guide, thus causing the needle to stick. This trouble accounted for his poor ascent in the previous class. He, like many others, rode minus a back mudguard. There was some discussion as to whether it would be compulsory to have rear guards the evening before. It was decided, however, to allow them to be removed. Godfrey was the only Englishman to ride without a front guard, and he arrived at the top of the hill with his face and clothes plastered with mud.

The road was kept clear by the police, a fair crowd being present. Had the weather been better, we were assured that a great number of motor cyclists would have journeyed over from Paris to witness the event. After all the classes had been run off the machines had to be taken to the official garage, where seals, which had been affixed to cylinders earlier in the day, were examined and the cylinders of the first three in each class were measured.

It will be seen from the results below that the Englishmen won all the classes, a striking demonstration of British superiority.

The Results.

CLASS I.—Engines not exceeding 255 c.c., minimum weight 110 lbs., tyre section 40 mm.

1. H. Newey (2¼ Levis) ... ... 1m. 5⅖s.
2. Brunet (1¾ Griffon) ... ... 2m. 21s.

Canale (Alcyon) fell.

CLASS II.—300 c.c. singles, 350 c.c. twins, minimum weight 110 lbs., tyre section 50 mm.

1. W. W. Douglas (2¾ Douglas) ... ... 0m. 56⅕s.
2. Rex G. Mundy (2½ Singer) ... ... 1m. 4⅖s.
3. Robert (N.S.U.) ... ... 1m. 12⅘s.
4. ——— (2¾ New Hudson) ... ... 1m. 19⅕s.
5. Dacier (2 Alcyon) ... ... 1m. 19⅗s.
6. Canale (2 Alcyon) ... ... 1m. 20⅘s.
7. Stoffel (2 Alcyon) ... ... 1m. 33s.
   Gomertz (N.S.U.) ... ... 1m. 33s.

CLASS III.—500 c.c. singles, 650 c.c. twins, minimum weight 132 lbs., tyre section 60 mm.

1. V. Taylor (3½ Rudge) 0m. 47⅕s
2. H. Reed (5 Dot) ... ... 0m. 52⅘s.
   A. P. Maurice (3½ Premier) ... ... 0m. 52⅘s.
3. E. H. Lees (5 Indian) ... ... 0m. 54⅖s.
4. W. G. McMinnies (3½ Triumph) ... 0m. 59s.
5. Gabriel (3½ Triumph) 0m. 59⅘s
6. Naas (Griffon) ... ... 1m. 10s.
7. Yves Fort (N.S.U.) 1m. 14⅕s
8. Olivier Fort (N.S.U.) ... ... 1m. 41⅗s.

O. C. Godfrey (3½ Indian), 44⅘s., disqualified.

AMATEUR CLASS.—On formula $\frac{2PV + V^3}{C}$.

1. V. Taylor (3½ Rudge) ... ... 0m. 46⅕s.
2. A. P. Maurice (3½ Premier) ... ... 0m. 53⅕s.
3. L. de Trévals (——) ... ...
4. E. H. Lees (5 Indian) ... ... 0m. 51⅗s.
5. Maurice Purson (———) ... ... 1m. 17⅕s.

VOITURETTES.—750 c.c. singles, 1,000 c.c. twins, 1,250 c.c four-cylinders.

CLASS I.

1. Ducasse (Sinpar) ... ... 3m. 3⅘s.
2. Pellier (Cohendet) ... ... 3m. 7⅘s.
3. Guerry (Bourguignon) ... ... 3m. 14⅕s.

CLASS II.—Belt-driven.

1. Bouville (Bedelia) ... ... 2m. 50⅗s.

The voiturettes covered 2 kilometres.

Items of Interest.

Altogether the party consisted of twenty, including competitors and their friends. Four went over to see the Levis win its class.

F. A. Applebee took a Scott and sidecar solely to demonstrate to those on the other side of the Channel. This necessitated a lot of work for himself and W. H. Wells, as they were obliged to detach the sidecar when putting the combination in the trains or on the boat.

The petrol level in Dacier's Claudel-Hobson carburetter was so high that he was obliged to turn his petrol off when standing still. It was suggested that he used no float.

It appears to be unnecessary to have identification number plates on these occasions, as many of the machines were minus these essential English fitments.

We saw an interesting machine in Coulommiers during the afternoon. It was a three-speed 3½ h.p. water-cooled overhead-valved sidecar combination with chain drive. It is known as the Viratelle. The one under notice, we understand, is the first of its kind.

Some of the English party stayed in Paris overnight, arriving in London at midday on Monday.

A.C.U. One-day Spring Trial Entries.

FOLLOWING are the entries for the A.C.U. Spring One-day Trial to be held on Saturday next, starting from the Swan and Sugarloaf Hotel, Croydon, at 8.30 a.m. The course is a secret one, but will extend over 160 miles. The luncheon interval is at Tunbridge Wells:

	c.c.	Gear.
*W. Cooper (3½ Bradbury) ...	517	N.S.U.
B. Haddock (2½ A.J.S.) ...	315	A.J.S.

More observers are wanted. Offers should be addressed to the A.C.U. secretary, R.A.C., Pall Mall, S.W.

Sutton Coldfield and Mid-Warwickshire A.C.

The A.G.M. took place on Friday, the 23rd inst., when the balance sheet for the past year was presented.

A very satisfactory state of affairs was shown, and there remained a good balance in hand at the bankers. Amongst the club's property there should be mentioned a complete set of first-class field telephones and timing apparatus bought during the past season, and no less than five silver challenge cups of an estimated value of £65.

It was decided, owing to the large increase of membership and consequent general work of the club, to engage the services of a professional secretary who would relieve both the trials and general hon. secs. of a large portion of their work. Another important matter decided upon was the alteration of the club to the Sutton Coldfield and Mid-Warwickshire Automobile Club. This was found necessary owing to the widening of the club's sphere of influence. In respect to the car members it was decided to become associated direct with the R.A.C., and only affiliate the motor cycle members to the A.C.U. Separate committees were arranged for each section.

The annual dinner and prize distribution of the club took place on Saturday, February 24th, when a goodly company of between sixty and seventy assembled. Prizes to the value of between £130 and £140 were distributed.

Mr. Thos. Clayton was chairman, whilst Mrs. Blyth Clayton attended and graciously presented the prizes to the various winners

A large number of lantern slides of motor and motor cycle events (some loaned by *The Motor Cycle*) were exhibited by Mr. T. Blyth Clayton and much enjoyed.

A SILENCER TEST AT LAST.

The Motor Cycling Club has decided to hold a motor cycle silencer trial on Saturday, April 27th, at a venue as near London as possible. No restrictions are being made with regard to standard silencers being fitted, and any means may be adopted to silence the machines. The motor cycles will be tested in such a way that it will be useless for a competitor to fit any device to his machine which affects the efficiency of the engine. Cut-outs in any form will not be permitted, and a jury of independent judges will be invited to arbitrate. This will be the first silencer trial which has been held by any private club, and every effort is being made to ensure a satisfactory test. The name and address of the hon. secretary of the Motor Cycling Club are Mr. Southcomb May, 34, Gower Place, London, W.C., to whom communications regarding the test should be addressed.

The first silencer trial in England was organised by the Auto Cycle Union in 1906, and that body has already announced its intention to hold a further trial this year.

CAMBRIDGE UNIVERSITY M.C.C. HILL-CLIMB.

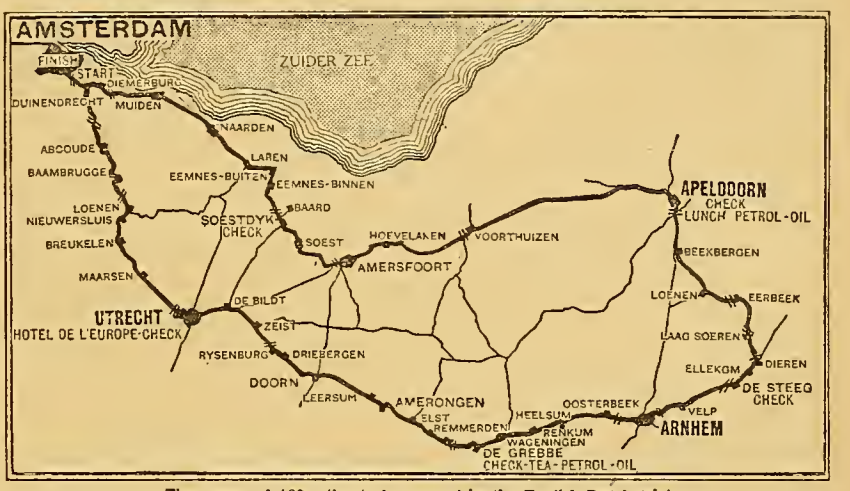
A very successful hill-climb was held on Saturday, February 17th, at Orwell Hill, near Cambridge. The results were as follows:

Class 1 (standard touring singles, on formula): 1, T. P. Ellis (2½ New Hudson), figure of merit 45.13.

Class 2 (multi-cylinders up to 750 c.c., on formula): 1, E. H. Lees (5 Indian), figure of merit 61.14.

Class 3 (T.T. singles, on time): 1, J. W. Cox (3½ Triumph), time 31⅖s.

Class 4 (all comers, on time): 1, E. H. Lees (5 Indian), J. W. Cox (3½ Triumph), and R. C. Maxwell (8 Matchless). All tied for first place in this class, time 32⅕s.



Class 5 (T.T. roadster singles, on formula): 1, O. E. Stout (3½ Rudge), figure of merit 43.33.

Fastest time of the day: J. W. Cox (3½ Triumph), 31⅖s.

ENGLISH-DUTCH TRIAL.

Map of the Course for the International Reliability Trial in August.

ON this page we reproduce two maps, one showing the whole of the route to be covered in the above International trial to be held on Bank Holiday Monday, August 5th, the smaller one being a map of Holland with the route shown on it to make clear the district covered. The distance of the trial is approximately 160 miles, and the only hill of note on the route is de Grebbe, which, however, should worry none of the English competitors. Mr. Citroen tells us that his 6 h.p. Matchless-Jap ascends the hill at a speed of fifty miles per hour, *i.e.*, with a flying start, but on the occasion of the trial the competitors will be stopped at the foot of the hill and despatched singly from a standing start. The trial will start at 8 a.m. from Amsterdam, whence competitors will journey to Naarden and Soestdyk (check), continuing *via* Hovelaken and Voorthuizen to Appeldoorn, where the second check is encountered and lunch will be taken. Replenishments will be allowed here. The first check in the afternoon is De Steeg, after which competitors proceed *via* Arnhem to the foot of de Grebbe. Here tea will be arranged, and it will be permissible for competitors again to replenish tanks. The only ascent on the route worthy of mention follows. Doorn is the next place of note, and at Utrecht competitors will be checked for the last time before finishing at Amsterdam, which is reached by way of Breukelen and Baambrugge. The speed to be averaged throughout is nineteen miles per hour, and competitors will be started in pairs, viz., one Dutch and one English rider. The system of marking will be on accepted British lines, an involuntary stop will not disqualify, but will involve loss of marks.

The course of 160 miles to be covered in the English-Dutch trial.

Teams Increased in Numbers.

At the council meeting of the Dutch Motor Cycle Club last week, in consideration of the already large entry, our suggestion to increase the teams to eighteen aside, *i.e.*, nine private owners and nine trade riders representing each country, was adopted, which means that fewer entrants who are anxious to compete will be refused. There will now be three riders in each class. The trip will extend over four days, and for the benefit of new readers we outline the daily itinerary.

Map of Holland, showing position of the International course.

Sunday, August 4th. The English party starting from Harwich on Saturday, August 3rd, at 10 p.m., arrive at the Hook of Holland at six o'clock on Sunday morning. A deputation from the Dutch Motor Cycle Club will be in waiting to conduct the English party to the Hague for breakfast. 10-11 a.m., a visit to Scheveningen, the celebrated bathing place. Lunch will be taken here. The remainder of the day will be spent sight-seeing at the Hague and Haarlem. At 3.30 a move will be made for Amsterdam, where the night will be spent, the Dutch M.C.C. having kindly offered to make all arrangements. The Dutch and English competitors will dine together at the official hotel.

Monday, August 5th, is the day of the trial.

Tuesday, August 6th, boat trip to the well-known fishing town of Volendam, and other places of interest. The return boat leaves the Hook the same night at ten o'clock, but it will be necessary for competitors to be at the Hook by 7.30 to 8 p.m., as it takes some time to embark the motor cycles.

Small Entrance Fee for Amateurs.

With regard to entry fees, it was agreed at a recent council meeting of the Dutch Motor Cycle Club, which is organising the trial, to charge an entry fee of 5s. to the British amateur entrants—this with the idea of eliminating those competitors who may be inclined to send in their names, but who are not seriously intent upon going to the country of windmills and upholding the reputation of their country. We shall therefore be glad if those amateur entrants whose names appear in this article who are still desirous of forming one of the British team will send the amount to the Editor, *The Motor Cycle*, without delay.

A National Trophy.

It is probable that a cup will be offered to the country winning the reliability trial, to be held for one year, the successful team having to defend the cup on its own ground.

In this connection it must not be taken as a foregone conclusion that England will win, for the Dutch motor cyclists are most enthusiastic and will leave nothing to chance.

Within the next week or two some definite scheme for choosing representative British teams will be com-

English-Dutch Trial.—

menced. A number of suggestions have reached us from readers which are having our consideration, but pending the scheme suggested by the Secretary of the Auto Cycle Union being put on paper, the matter of choosing the teams is in abeyance. It will be noticed that in Class A only two different makes have been entered by private owners. If the cubic capacity were increased to 350 c.c.—as we have suggested to the Dutch M.C.C.—it would admit the standard pattern of other well-known lightweights, and the Dutch M.C.C. are desirous that the entries should include as many makes as possible. So far the following riders have entered:

PRIVATE OWNERS.

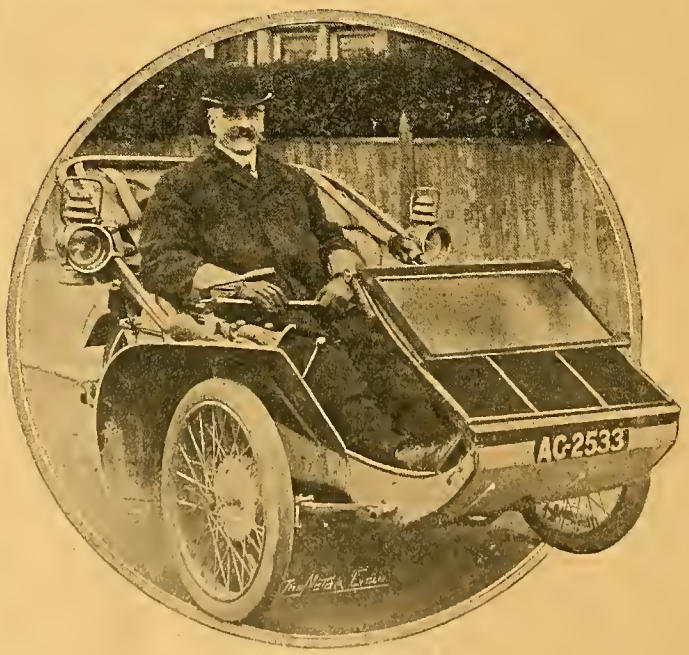
Class A. Machines up to 340 c.c.	Class B. Machines from 340 c.c. to 500 c.c.	Class C. Machines from 500 to 1,000 c.c.
J. C. Bennett Mitchell (2¾ Douglas)	Geoffrey Smith	W. Cooper (3½ Bradbury)
H. M. Carter (2¾ Douglas)	Vernon Taylor (3½ Rudge)	L. A. Baddeley (7 Indian)
F. C. Wasley (2¾ Douglas)	Seymour Smith (3½ Norton)	W. O. Oldman (Bat)
D. J. Danth (2½ Grandex-Precision)	Fred Dover (3½ Premier)	C. W. Wilson (Morgan runabout)
	A. E. Uffleman (3½ Humber)	Gordon B. McKechnie (8 Dot-Jap)
	C. C. Cooke (3½ Triumph)	André Manheim (T.A.C. sidecar)
	Horatio Wallis (1912 Triumph)	E. B. Ware (Chater-Lea sc.)
	Richard Cussons (3½ New Hudson)	

F. A. Hardy, machine not stated.

TRADE TEAM.

Class A. Machines up to 340 c.c.	Class B. Machines from 340 c.c. to 500 c.c.	Class C. Machines from 500 to 1,000 c.c.
W. W. Douglas (2¾ Douglas)	W. Pratt (3½ P. and M.)	F. W. Barnes (6 Zenith)
R. Holloway (2½ Premier)	J. Woodhouse (3½ Precision)	Hugh Gibson (3½ Bradbury)
Sam Wright (2¾ Humber)	W. F. Newsome (3½ Triumph)	W. H. Wells (7 Indian)
H. V. Colver (2¾ Enfield)	Roy W. Walker (3½ New Hudson)	Frank Smith (5-6 Clyno)
R. G. Mundy (2½ Singer)	F. C. North (3½ Ariel)	R. Lord (6 Rex sidette)
H. Graham Dixon (2¾ New Hudson)	Geo. Brough (3½ Brough)	F. A. Applebee (3½ Scott)
J. S. Holroyd (Motosacoche)		

LADIES' SECTION.



Mrs. A. Wade (3¾ Scott) | Mrs. C. C. Cooke (3½ Triumph)

A Sociable of Special Construction.

WHILST riding his Douglas, Mr. J. Parker, instructor of physical culture, etc., at the Abbey School, Beckenham, and other well-known schools, had the misfortune to be run down by a large car driven by a chauffeur at a local road junction. After smashing the machine and rider, the car continued on for another forty yards before coming to a stop against a wall.

In an action-at-law the motor cyclist obtained £240 from the car owner, but unfortunately his injuries left him with a permanently stiff knee, the bone refusing to unite.

Recently a public testimonial was opened on his behalf, the subscribers including not only many friends and present pupils at the Abbey School, etc., but many former pupils residing in various parts of the country.

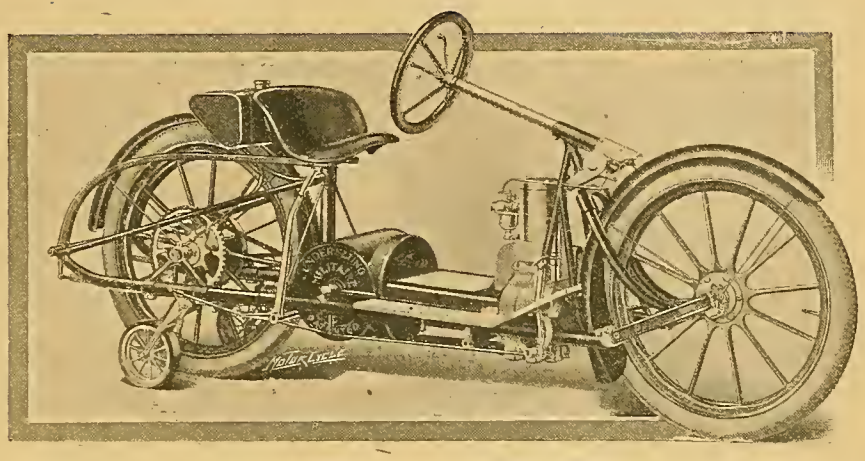
J. Parker and his A.C. sociable.

With part of the proceeds—on Mr. Parker's suggestion—an A.C. Sociable has been purchased, and the machine he has already found of great assistance for travelling in connection with his profession.

Owing to his injury a straight leg position was necessary, and as the A.C. is low he can mount or dismount easier than would be the case with a four-wheeled car, and, after his experience with motor bicycles, he found the management and control an easy matter after one short ride.

Extra Fitments.

The machine is smartly painted in grey, and has one or two fitments of interest; for instance, an extra hand-applied brake at the right side, though this is seldom required. Duplicate ignition is also provided, and adjacent to the starting handle is a sliding lever operating the carburetter; this is very handy for starting up the machine. A screen is also fitted, the whole making a very business-like machine.



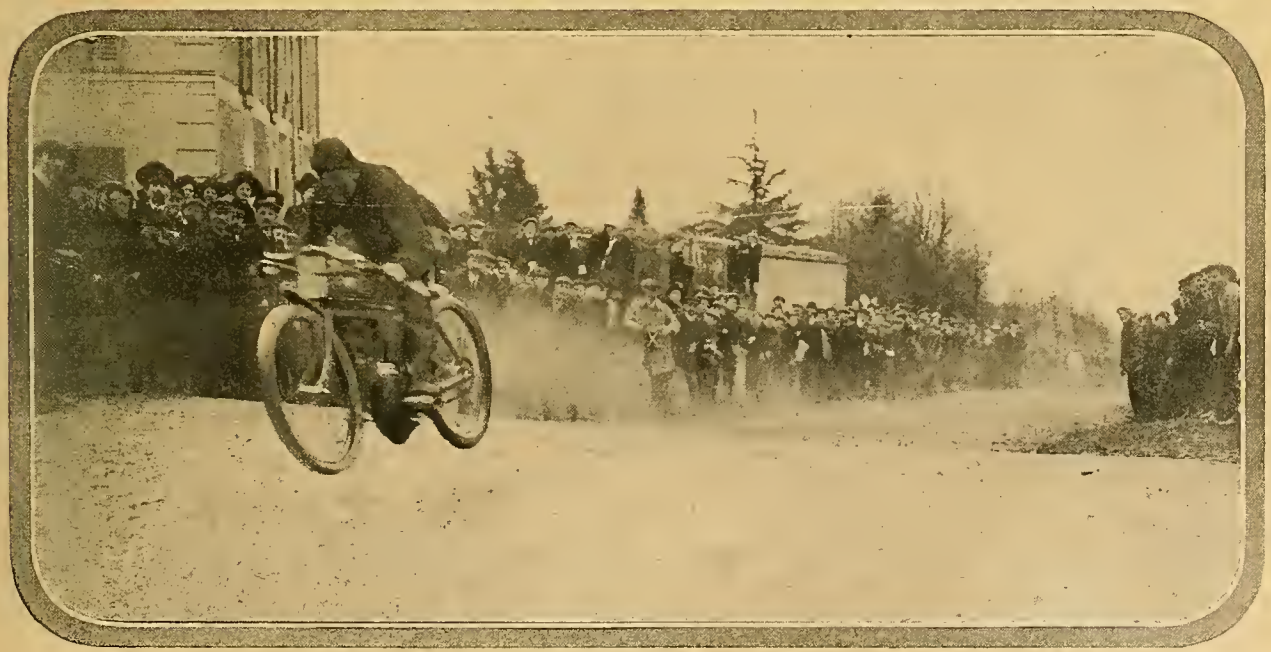
One can understand that Mr. Parker finds the A.C. invaluable. Its upkeep is comparatively inexpensive, and it is handier and certainly faster than the small single-cylinder car.

"Of course," he states, "it is not such a sporting machine as a motor bicycle." His Douglas—which he still retains—was the identical machine that made a non-stop in a winter A.C.U. Quarterly Trial, when ridden by his friend, Mr. H. A. Cooper.

A NOVEL DESIGN OF MOTOR CYCLE.

THE latest American production is the underslung Militaire, a motor cycle with an open frame incorporating some radical departures. The makers assure us that it is the outcome of two years' experimental work, and they are firmly convinced that "it is five years ahead of the motor cycle world, from every point of view." It has artillery wheels and "idler" wheels attached to each side of the frame, controlled by the side lever seen in the illustration. The centre of gravity is unusually low.

The engine is a vertical single-cylinder, air-cooled, enclosed by a polished casing, open at the top. The air is drawn down by a highly developed sirocco blower in the flywheel, and discharged downward and away from the rider. This cooling system is said to be equally efficient with the machine travelling or standing.

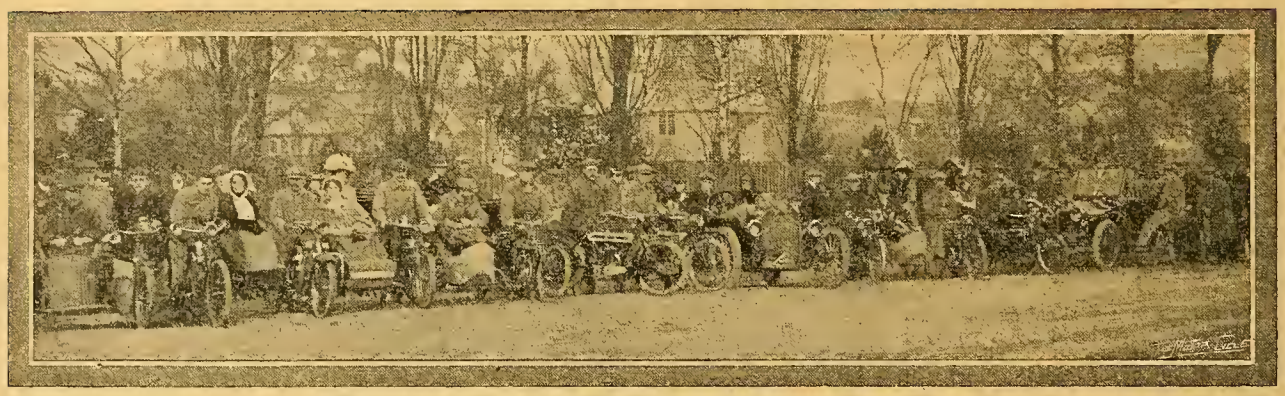


An American novelty. The Underslung Militaire.

A unique feature of the design is the friction drive, which gives any variation of speed desired, from 30 to 1 on low to 3 to 1 on high, with 10 to 1 on reverse. The steering wheel is identical with standard car practice, the control levers working from the centre of the column.

THE MOTOR CYCLISTS' PROGRESSIVE ASSOCIATION.

A meeting was held at the Holborn Restaurant, at 7.30 p.m., on Thursday, the 22nd inst. The chairman, Mr. Otto Thomas, stated that he would allow no personalities during the course of the discussion, and stated emphatically that if the M.C.P.A did nothing else it would take steps to suppress bad manners at public gatherings. The Chairman then announced that the membership numbered forty-five. The main business of the meeting was to select suitable men for election on the new committee. A ballot to elect representatives for the committee at the private members' meeting on March 7th resulted in the election of: Messrs. A. Sharp, Otto Thomas, W. Cooper, H. F. S. Morgan, T. H. Tessier, W. Pratt, T. Carter, W. H. Wells, A. H. Priestley, T. Rhys Pyle, G. N. Higgs, and G. L. Fletcher. Eighteen members were then suggested to represent the affiliated clubs on the A.C.U. committee. These are: Messrs. A. J. Moorhouse, T. Oliver, W. H. Browne, F. A. Hardy, W. G. McMinnies, B. Marians, C. J. Feeney, T. W. Loughborough, Hal Hill, E. J. Bass, D. Slatter, G. Rowden, R. Mundy, R. Fletcher, E. B. Ware, J. Foote, P. Mills, and E. Garrett.



It was decided to send round the list of suggested club representatives to all the affiliated clubs asking them to add further names. When this has been done the M.C.P.A. committee will select from the extended list a final one which will be submitted at the annual general meeting of the council on March 30th. Mr. A. G. Reynolds suggested that the secretary of the R.A.C. be asked to receive a deputation who would explain the programme of the Motor Cyclists' Progressive Association.

LA COURSE DE CÔTE DE MONTANGLAUST.

A decided hump was encountered during the ascent, which lifted machine and rider clear of the ground. O. C. Godfrey (Indian) is seen with both wheels of his machine several inches off the ground. He made fastest time in his class, but was disqualified for using auxiliary exhaust ports.

CLUB NEWS.

Group at the start of the Leicester M.C.C. opening run to Lutterworth last week-end.

Glasgow M.C.C.

The annual general meeting will be held this evening at eight o'clock, at the Religious Institute Rooms, 200-204, Buchanan Street, Glasgow.

Reading and District M.C.C.

At a meeting held at Reading recently, the reconstruction of the above club was decided upon. New officers were elected, new rules drawn up, and a programme formulated. The new hon. secretary is Mr. S. A. Serpell, "Bromsberrow," 69, Alexandra Road, Reading.

Maidenhead and District M.C.C.

A breakdown competition was held at the Saracen's Head (headquarters) on the 20th inst., but no one proved successful. Many new members were enrolled. Local motor cyclists should apply to Mr. H. H. Hacker, hon. secretary, 25, High Street, Maidenhead.

Essex M.C.

Included in this club's open hill-climb on March 16th is the first competition ever held for the new type of vehicles officially designated "cyclecars." The A.C.U. has granted a permit for this class, and the club has fixed the limit at 1,100 c.c., with a maximum weight of 7 cwts., to include proper touring bodies and complete outfit as sold to the public.

Western District M.C. (London).

The recent lantern lecture on Switzerland by the hon. secretary was much appreciated. There is a committee meeting at headquarters, at 8 p.m., March 1st. The provisional fixtures for March are: March 3rd, opening run to Wisley Hut, Surrey. March 9th, Rickmansworth. March 10th, Redbourne. March 17th, Stokenchurch. March 23rd, Staines. March 24th, Reigate. March 31st, reliability trial for N.S.U. gold medal.

Taunton and District M.C.C.

The club will hold its open hill-climb on Thursday, May 16th. The hill selected is Cothelstone Hill, about seven miles from Taunton, and one of the suggested test hills for the six days' trials in August. It is about one mile in length, with two bad corners, and has a gradient of about 1 in 6 at its steepest part. All events will be won on fastest time. There are five open classes and two club classes. Full particulars, rules, and entry forms are ready, and can be obtained of the hon. secretary, Mr. W. G. Potter, 41, Belvedere Road, Taunton.

North Birmingham A.C.

At a meeting of Erdington and district motorists, held at the Acorn Hotel, Erdington, on Tuesday, the 20th inst., presided over by Mr. W. B. Goodwin, the proposal to form a club under the title of the North Birmingham Automobile Club was met with great enthusiasm, and over thirty members were enrolled, and almost as many promises from others who were unable to attend the meeting. Mr. W. C. Sutherland, of "Daylesford," Moor End Lane, Erdington, was elected hon. sec., Mr. R. Ernest Yates hon. treasurer, and Mr. W. B. Goodwin trials hon. sec. It was decided to affiliate with the R.A.C., also the A.C.U.

Redditch and District M.C.C.

The second annual general meeting of the club will be held at headquarters, the Unicorn Hotel, Redditch, on Wednesday, March 6th, at 8.30 p.m.

South-east London M.C.C. and Woolwich, Plumstead, and District M.C.

The inter-club competition between these clubs will take place on March 16th, starting from the Fox, Keston. The course decided upon is a severe one in Kent, including two stiff hills which will be observed. Gold medals will be presented to the winning team.

Brookdale Club, Catford (Motor Section).

At a meeting held at headquarters on Friday last, Mr. W. J. Cakebread in the chair, the following officers were elected: Messrs. H. A. Cooper (captain), G. H. Shrimpton (vice-captain), and B. T. Soppit (hon. sec.), to whom all communications should be addressed. The opening run was fixed for March 31st, leaving headquarters at 10.30 a.m. The club is to be affiliated to the A.C.U.

Rotherham and District M.C.C.

On Friday, the 23rd inst., a large and enthusiastic meeting was held at Horsfall's Café, High Street, when it was unanimously decided to form a motor cycling club. The club commences with a membership of forty-eight. The following officials were elected: President, Mr. J. H. Pickford; secretary, Mr. R. H. Gilling, College Street; treasurer, Mr. H. Page; captain, Mr. E. Cross. The secretary announced that Mr. Pickford had signified his intention to give a trophy for competition by members of the club.

Bristol B. and M.C.

The inter-team event last week was a great success. Seven aside started over a treacherous course from Westbury-on-Trym, and the sub-captain's team defeated the captain's team on points.

On the 20th inst. an interesting paper on "Modern Lightweights" was read at headquarters, Mr. R. E. Moore demonstrating a Junior T.T. Humber.

Competitors in the recent Bristol B. & M.C. inter-team trial.

Club News.—

Oxford University M.C.C.

The hill-climb, announced last week to take place at Horsepath on March 9th, is open to past and present members of the University.

Purley and District M.C.C.

Mr. A. E. Bennett lectured on "Magnetos" on Monday evening, the 19th inst. to a good audience, who showed their interest by numerous questions The membership advances by leaps and bounds. The competition season opens on March 9th with a night trial over a course of some 140 miles.

Wansbeck M.C.

The annual meeting will be held at the Portland Hotel, Ashington, March 20th, at 7.30 p.m. After the usual business has been transacted, Dr. V. Burrow will read a paper on "Wayside Repairs and Makeshifts."

Bristol B. and M.C.

A highly successful team trial (captain v. sub-captain) was held on Saturday, the 17th inst., with Westbury-on-Trym as a centre. Sixteen members turned out over a course that was tricky and treacherous. In the end the sub-captain's team won. The whole of the competitors were amateurs.

CLIMBING WAFMINGTON HILL IN

THE MIDLAND RELIABILITY TRIAL.

R. E. Guest (6 h.p. Matchless sidecar) winner of the gold medal for best performance by an amateur.

NEW RECORD MADE IN NATAL.

Of the several motor cycle events in the motor gymkhana held by the Natal M.C.C., the most interesting was the race won by J. M. Read (Buchet racer) in the record time of 12m. 38⅖s. for ten miles. His opponents were F. G. Raynor (Ariel) and C. Morris (N.S.U.), but as their machines were standard touring mounts, it is not surprising that Read won, though at the beginning Raynor went ahead.

HILL-CLIMB IN AUSTRALIA.

The West Australian Motor Cycle Club held a hill-climb at Mount Street in December. The day was very unsuitable, the wind coming in violent gusts down the hill. This was the first official climb, and an amusing incident on the day previous was the arrival of several police officers with orders to arrest those practising for exceeding the limit. Several competitors' names were taken, and only after a deputation to the chief of police was the matter dropped.

Lightweight Class up to 300 c.c.—1, J. C. Cockrane (2-sp. F.N., 1 cyl.); 2, Wallis Nelson (2-sp. F.N., 1 cyl.); 3. Cliff Lloyd (N.S.U., 2 cyl.). Fastest time, Cliff Lloyd.

Standard Touring 3½ h.p. 500 c.c.—1, R. Wigmore (3½ Triumph, 1 cyl.); 2, H. Norton (3½ Kerry-Abingdon, 1 cyl.); 3, B. Thornley (3½ Triumph, 1 cyl.). Fastest time, R. Wigmore, 29⅖ sec.

Open event.—1, J. Naylor (4-cyl. F.N.); 2, W. Nelson (2-sp. F.N., 1 cyl.); 3, H. Norton (1 cyl. Kerry-Abingdon). Fastest time, J. Naylor.

SOUTH AFRICAN CHAMPIONSHIPS.

The motor cycle championships, held on the West Rand on January 21st, provided some very interesting racing, and some excellent performances were made. P. Flook and J. Hodgson are especially to be congratulated, as is also G. T. Taylor, who won the open event. J. Hodgson (Bradbury) made the fastest time of the day, the time in the open event being rather slower in consequence, possibly, of the wind which had sprung up. P. Flook (Humber twin) won the lightweight class in excellent time (faster than many of the larger machines). Results:

LIGHTWEIGHTS.

		M.	S.
1.	P. Flook (Humber twin)	4	25
2.	T. F. Stange (Singer)	4	36⅕
3.	G. Preston (Humber twin)	4	50

STANDARD SINGLES.

1.	C. Bright (Triumph)	4	1⅘
2.	A. Siems (B.S.A.)	4	4⅗
3.	A. L. Fox (Bradbury)	4	5

RACING SINGLES.

1.	J. Hodgson (Bradbury)	3	39⅗
2.	P. Flook (Triumph)	3	43⅘
3.	J. Steele (Triumph)	3	49⅕

ANY MACHINE.

1.	G. T. Taylor (Bat twin)	3	44
2.	P. Flook (Triumph)	3	45⅖
3.	J. Hodgson (Bradbury)	3	47⅖

Questions and Replies

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Chain or Belt.

I am placing an order for a lightweight, but am undecided between two makes, similar in all respects except the drive—one being chain and one belt. Should prefer chain if satisfactory, but do not want to order one if unsatisfactory.—J.D.

You may quite safely invest in either belt or chain drive. Chain transmission, if looked after, really gives less trouble than belt, but the drive is hardly so sweet. There is, however, very little difference in this respect.

Foot Starter. Pillion Seats.

(1.) Is there a kick or other start-operator that I can have fixed to a Zenith Gradua gear motor cycle, 6 h.p., with sidecar, to prevent the run and jump start; and at what price? (2.) Do you think a pillion seat would interfere with the Gradua gear? (3.) Do you advise a side or straddle seat?—V.C.

(1.) No, there is no starting device which can be conveniently fitted to this machine. (2.) There is no reason why you should not have a pillion seat on the carrier if you desire it. (3.) This depends upon whether you desire to carry a lady or a gentleman.

Large Single-cylinder Engines.

Would you kindly inform me what is the largest air-cooled single-cylinder engine now being built for motor cycles? For seven years I used a special De Dion 90×100 engine, which, driven in a particular way of my own, gave the greatest possible satisfaction and absolutely smooth running although geared 4 to 1. I wish to procure another such engine at least as powerful, and with a heavy flywheel. The latter feature is, of course, essential to the best running. Why I particularly wish for the single-cylinder is that I like trying experiments, which are thereby considerably facilitated.—F.H.

Below we give some of the largest single-cylinder engines on the market:

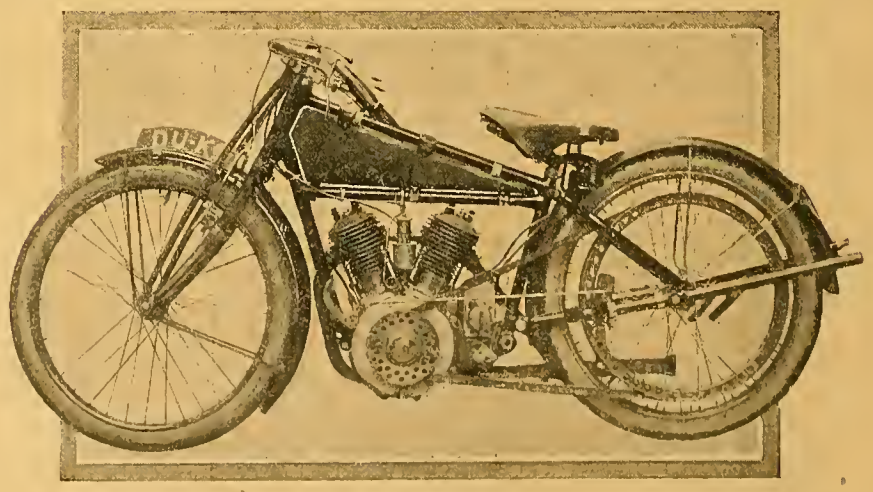
	MM.	C.C.
4½ h.p. Excelsior	86 × 112	650
4½ h.p. Norton...	82 × 120	636
New Imperial ...	90 × 96	611
J.A.P.	90 × 93	592
Precision ...	89 × 95	597
Buck	90 × 95	604
Calthorpe ...	90 × 96	611

Single-cylinder and Sidecar.

(1.) I am wanting a motor cycle and sidecar for light work (*e.g.*, 18 stones and not long journeys—twenty to fifty miles—nor 20 m.p.h.). Will a 3½ h.p. fitted with two speeds do what I want? I suppose some hills will have to be climbed with passenger walking, but, I hope, not pushing. (2.) Will it be worth my while to go to the extra expense of a radial castor sidecar? (3.) If I wanted to take a big bag, say 40 lbs., in a rigid sidecar—no passenger—would it be safe (not the bag, but for myself)? (4.) Is an Armstrong three-speed gear likely to last as long as a two-speed and which would you recommend for above work.—T.L.C.

(1.) You must not expect very extraordinary results from a 3½ h.p. single-cylinder machine with sidecar. It would, however, do ordinary work in a country which is not very hilly. (2.) We should say the ordinary rigid wheel sidecar would be good enough. (3.) We consider that 40 lbs. would be hardly enough ballast to carry. The ballast should be somewhere approximate to the weight of a passenger. It is, however, quite possible to ride with the sidecar empty. (4.) We should say the three-speed gear would outlast the machine, and three speeds are always better than two.

Spark Advance and Economy.



To settle an argument we have decided to leave it to your decision. One says a motor cycle, say on 100 miles run, will use more petrol with the spark retarded than on the same journey with spark advanced. Is this so?—S.W.

Yes. There is no doubt that to drive as economically as possible the ignition should be fully advanced, the gas should be cut down and as much air should be admitted as the carburetter will take.

Trembler Coils on Hills.

A short time ago I bought a book on motor cycling ("Hints and Tips for Motor Cyclists"), and in paragraph 197 I find the following: That a trembler coil in conjunction with a make and break contact gives the best firing on a hill when the engine slows down a little. Why is this so?—R.W.

The advantage of the trembler coil on a hill when running slowly is that the speed has no effect upon the intensity of the spark, as the make and break occurs electrically. With a plain coil or magneto you get a feebler spark at low speeds, as, to get a good spark, the points of the contact breaker should separate quickly, and the quickness in this case depends on speed of rotation.

A SPORTING MOUNT.

The above is the latest design produced by the Rex Motor Manufacturing Co., Ltd., and is likely to be seen in forthcoming open events in the hands of R. Lord. As will be noticed the frame permits of the lowest possible riding position. The engine is the standard 6 h.p. twin m.o.i.v. Rex. 77.5 × 95 mm.

Running on Acetylene Gas.

In the event of running short of petrol miles from the nearest town, is it possible to run a standard one-cylinder motor bicycle, B. and B. carburetter, etc., on acetylene gas by connecting the generator tube to the carburetter by taking the jet out, pushing the tube up, and plugging the bottom air hole with rags, and running with extra air and throttle as before? If not, what adjustments should be necessary? I understand this is possible, as I believe Prince Borgia ran his Itala several hundred miles thus in the Pekin-Paris race some years ago. Is the makeshift advisable?—EK 160.

It is quite possible to reach home on acetylene gas as supplied by your lamp generator. Acetylene, however, is somewhat uncertain in its action, and occasionally rather more violent in its explosions than one would like, consequently there is always some risk in its use. It might be that a broken connecting rod would result. It is quite possible to run on paraffin, which can generally be obtained, but it is difficult to start the engine if it has had time to cool.

Dry Cells and Coils.

I should be glad if you would help me with a second-hand motor cycle I have bought. It is of 2¾ h.p., a.o.i.v., accumulator ignition by trembler coil. (1.) I am told that the trembler coil will quickly run down a dry cell (which I prefer to an accumulator), and that it must be run on an accumulator. Is this so? (2.) The crank case compression release valve is in front of the cylinder, and consequently a lot of oil is thrown out. Would a pipe fitted in and ended at the bottom of the crank case be advisable? (3.) What are the best means of keeping an a.o.i. valve in order? The machine is fitted with a new h.b.c. B. and B. carburetter.—J.S.E.

(1.) Many trembler coils are certainly extravagant and so quickly run down a dry cell. Under the circumstances you had better purchase a special economical plain coil supplied by vendors of dry cells. (2.) Certainly a pipe fitted as you suggest would be an advantage. (3.) These valves need no special attention except examining the springs and renewing them from time to time; also keeping an eye upon the lift, which often varies through wear on the cotter.

A Common Query.

(1.) Please let me have your readers' experiences with regard to the 3½ h.p. Lincoln-Elk motor cycle. (2.) I should also want to convert the above machine into a two-speed free engine. Can you recommend a good inexpensive make?—H.J.

(1.) The reports concerning this machine we have received of late have been quite satisfactory. If you wish for readers' experiences, kindly write us a separate letter to this effect, enclosing a stamped and addressed envelope in which the replies may be sent to you. (2.) We should recommend you to communicate with the makers regarding a two-speed gear for this machine.

Cams and Tappets.

I would be greatly obliged if you would kindly state briefly your opinion of the merits and demerits of an engine the tappet rods of which are operated direct from the cams, as compared with one where rockers are interposed between the cams and the tappet rods.—R.W.

When rockers are interposed between the cams and tappet rods there is far less friction, and the tappet rod has a direct vertical lift, and there is no binding action on the guide. This, we think, speaks sufficiently well for this particular system. Engines in which no rockers are interposed between the cam and tappet rod cannot therefore be so efficient, and the wear on the tappet guides is likely to be excessive.

READER'S REPLY.

Petrol Leakage on to Exhaust Pipe.

I observe in your issue of February 15th, page 162, in reply to "Novice's" queries, you state that if the petrol were to leak on to a red hot exhaust pipe it would cause an explosion. On February 16th I conducted a small experiment in the following form: I placed a small quantity of petrol in a tin and plunged a red-hot soldering iron into it. The result was that fumes came from the petrol, but no flame. Therefore, I imagine that if the petrol were to leak on to a red-hot exhaust pipe the result in this case would be the same as in my experiment.—JUVENILE.

[The above experiment is a dangerous one, and the fact that the petrol did not catch fire is no proof that it would not do so under slightly different conditions. It reminds us of a case of a veteran motorist who was experimenting with a spark gap, some nine years ago. He thought he had conclusively proved that a naked external spark gap on a plug could not set fire to petrol vapour. To do this he soaked petrol in cotton wool and placed it adjacent to the gap. Having agitated the trembler forty-nine times he came to the conclusion that his theory was proved, but he finally decided to try once more for luck when he found, to his surprise, that the cotton wool instantly blazed up.—ED.]

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"South Carolinian" (Shrewsbury) would like the advice of readers who have successfully converted a 9 h.p. Riley tricar to the sociable type.

"T.O.L.H." (Hebburn).—5 h.p. A.J.S., with and without sidecar.

"A.C.F." (Aylesbury).—3½ h.p. Rudge, with multi-speed gear.

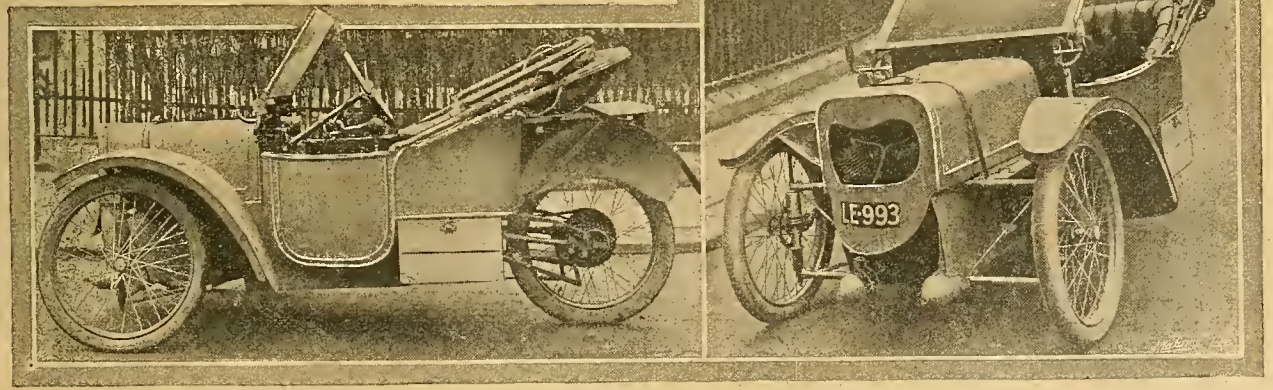
"F.W.C." (Ledbury).—3¾ h.p. 1911 Scott sidecar.

"F.J." (Swansea). — Bedelia and Sabella quadcars. Durability, etc.

"A.T.B." (Lowestoft).—1911 3½ h.p. Tourist-Rex sidecar.

"K." (Greenock).—Steel-studded and rubber-studded tyres with 5 h.p. twin sidecar.

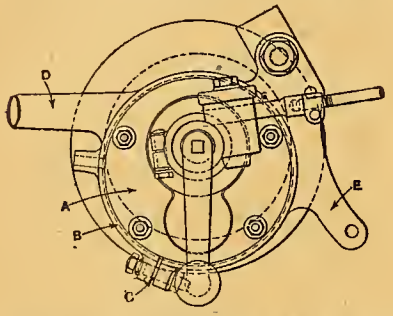
"W.B.H." (Tunbridge Wells).—L.M.C. Auto-Varia pulley and free engine on 5 h.p. twin-cylinder.



"J.K." (Huddersfield). — Sturmey-Archer three-speed gear with sidecar.

"C.W.S." (Kettering).—8 h.p. Bat two-speeds and sidecar. Also Binks carburetter.

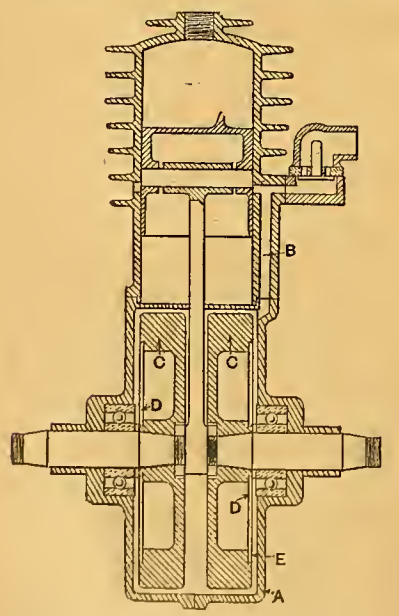
"C.J.F." (Manchester).—2½ h.p. Premier, Armstrong three-speeds.



"W." (Cardiff).—A.L. generator. Reliability, etc.

An 8 h.p. Morgan Runabout fitted with a London made two-seated body. It may be seen at Messrs. Harrod's, Ltd.

Speed Gear Transmission Adjustment.

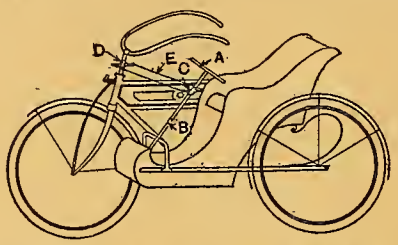


The two-speed bottom-bracket type gear which is being experimented with by the Triumph Company is provided with simple means for adjustment of the chain by which it is driven from the engine. The gearshafts are mounted in a circular casing A, the periphery of which is eccentric to the axes of the shafts. This casing is carried in a housing B which is split, and provided with a clamping bolt at C. It is obvious that by slacking off the bolt C, and rotating the casing A in

the housing B the distance between the engine and the gearshafts can be adjusted. The housing C is formed integral with the frame lugs D and engine clamping plates E.—Triumph Cycle Co., Ltd., and C. W. Hathaway, No. 7,957, 1911.

Two-stroke Engine Flywheel Construction.

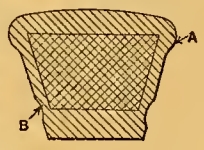
This invention relates to the type of two-stroke engine in which the charge is first drawn into the crank case A and then forced into the combustion chamber *viâ* transfer ports B by the downward movement of the piston. The object is



to reduce the air capacity of the crank case by enclosing the space left by the overhanging rims C of the flywheels. This is effected by the insertion of plates D, which are held in place by spinning over the flywheel faces as shown at E.—Stuart-Turner, Ltd., and A. F. Flint, No. 2,213, 1911.

PATENTS by Eric W. Walford A.C.I.P.A.

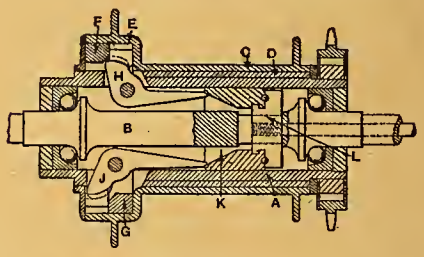
Sidecar Control.



In order to enable a sidecar combination to be driven from the sidecar seat a steering wheel A is provided mounted upon a

pillar B, having arms C, connected by rods E to corresponding arms D on the cycle handle-bar. The engine control may be effected by suitable hand or foot levers arranged conveniently for the occupant of the sidecar.—H. Dawson, No. 6,730, 1911.

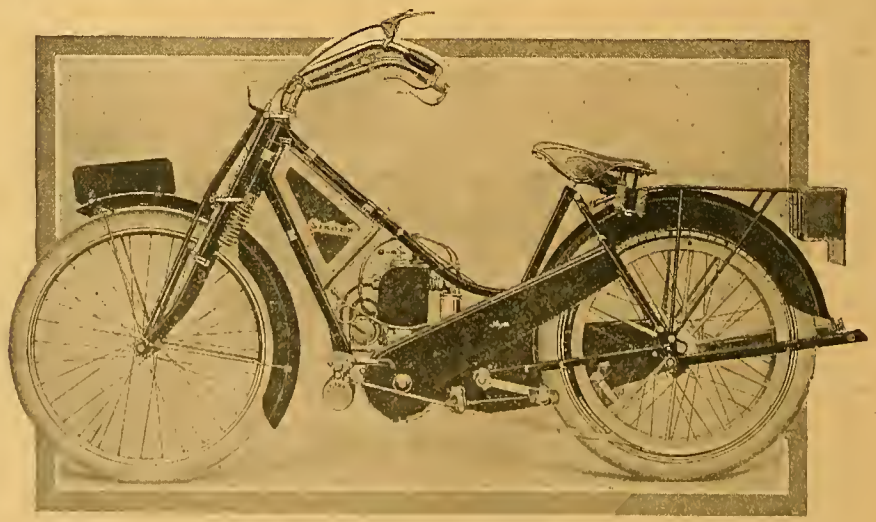
A Dunlop Belt Improvement.



In this specification it is pointed out that when a belt having flat inclined sides passes round a pulley of small diameter, the total area of the sides does not engage the pulley flange. This effect is produced by the distortion of the belt causing its upper and wider part to decrease in width, whilst at the same time the compression of the lower part, due to the curve of the belt, causes an increase of width, the intermediate portion of the sides remaining practically normal.

The result is that the upper and intermediate portions of the belt do not materially assist in the drive. To overcome this, the belt is moulded as illustrated in section. The sides, at the widest part of the belt, are formed with ribs A of rubber, and at the narrower parts have grooves B. By this means, distortion of the upper part "draws in" the rib A, and compression of the narrower part fills up the groove, the two sides of the belt thus becoming practically flat and affording the maximum frictional surface.—Dunlop Rubber Co., Ltd., and J. V. Worthington, No. 3,009, 1910.

The D.H.K. Hub Clutch.



In this simple and ingenious free engine hub the belt pulley and pedalling sprocket are carried by a sleeve A mounted upon ball bearings on the spindle B. Around the sleeve A is arranged the hub shell C, a bush D of phosphor bronze being interposed and secured to either the shell or the sleeve. The shell C is enlarged at E to accommodate a pair of brake bands F G, which are adapted to be expanded by

levers H J pivoted on the sleeve A. These levers are operated by an internally recessed sliding collar K, which in turn is moved by a sliding rod and block L, thrust bearings being interposed as shown.—J. Doherty, No. 19,560, 1911.

EDITORIAL NOTE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

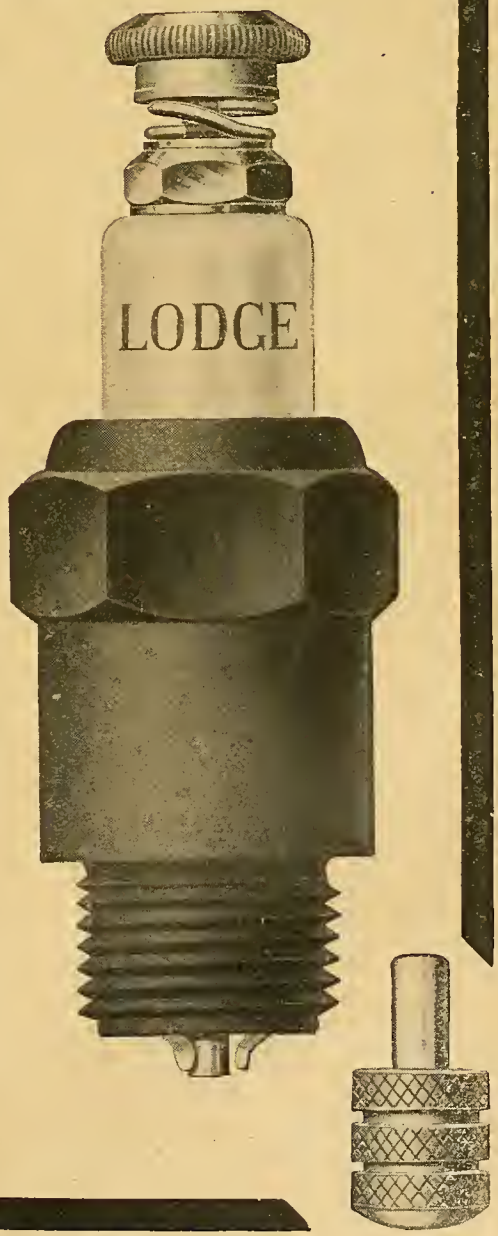
The finished lady's model 2¼ h.p. Singer, the dress guarding of which is worthy of special notice. The machine illustrated is a clutch model; it can also be obtained with a two-speed countershaft gear if desired.

THE EASTER HOLIDAYS

begin on April 5th.
Get your machine ready in the pink of condition before then.
An essential item in your outfit should be

A LODGE SPARKING PLUG

DESIGNED FOR MAXIMUM POWER.



IMPORTANT ANNOUNCEMENT

Lodge Bros. & Co. have pleasure in advising all motor cyclists that on and after March 1st the Lodge T.T. Steatite Motor Cycle Type Plug (as illustrated) will be sold everywhere at **4/-** each.

Owing to the great success of this T.T. Steatite Plug, the price of which has always been **5/-**, hitherto, we have decided to supply it as our regular motor cycle plug for the future. Although the ordinary porcelain insulated type will still be procurable when required.

This special T.T. Plug is more expensive to make than our ordinary pattern, but we hope and expect that all motor cyclists will so appreciate the reduction in price that we shall be able to make up for the reduced profit on each plug by the greatly increased quantity which will be sold.

When buying the plugs it is only necessary to say Lodge Motor Cycle Plug; and it is packed in a striped red box. Each box contains the plug and sparking point gauge as illustrated, push-on terminal, copper-asbestos washer, and instructions.

PRICE 4/- NETT.

A REVOLUTION IN CARBURETTERS

RACERS, 59/-

ROADSTERS, 45/-

Complete with Lever Wire Variable Choke Tubes and 6 Spare Jets.

If you doubt what I say you can readily believe the following unsolicited TESTIMONY:—

H.M.S. "Cynthia,"
Sheerness.
Jan. 29/12.

Dear Sirs,

I am writing to thank you for your advice *re* fitting a two-jet carburetter to my 5/6 Bat-Jap two-speed gear and sidecar. I have had it fitted and tried under a good variety of conditions of weather, etc., and find that every one of your claims have been fulfilled. The results were excellent, and far exceeded my hopes. I have done away with the troublesome and dangerous practice of injecting petrol in the cylinders (I have three times had a carburetter on fire through this) and can now start a walking pace without any preliminary fiddling about.

I find the single lever control very easy, and the engine is now quite amenable to the slightest alteration of throttle and very sensitive to small alterations of the spark lever, enabling the engine to be kept just ticking when free, as you claim. I have never been able to do this with a high powered engine before, although I think I am gifted with the average amount of common sense. On top gear the machine will climb hills with a passenger that it wouldn't look at before except on low, and the pace on long moderate hills has increased in a most gratifying way. In short, your carburetter has transformed a really good machine into a far better one, and I cannot myself understand why makers send out expensive machines not fitted with a carburetter that will give these results, when for a few shillings extra such a one could be fitted. Surely the machines are worth it? Please send me three spare springs for keeping the choke barrels in place, and let me know the cost. I might mention that I heard of your carburetter quite by chance,

Yours faithfully,

The original of this letter will be shown at the works.

If you will call on me I will show you scores of similar letters, which I greatly prize.

GENTLEMEN, this is what you MUST HAVE to get EASY START, a SLOW PULL in TRAFFIC, PERFECT FLEXIBILITY, UTMOST POWER, and A TICK ROUND when STANDING or DECLUTCHING

(Remittance must accompany all post orders).

HOW TO DO IT!!!

This is a question we are very often asked by intending purchasers! If you have a motor cycle, and you want to get rid of this in exchange for another, the proper way to do is to write to Hitchen's, of Morecambe, for an estimate of the value of the machine, at the same time mentioning what you think it is worth yourself. They will then tell you, to one or two pounds, what they will allow in exchange for another machine; and they will also tell you when they can deliver it, if it is a new one. If a second-hand one, they will send you full specifications in a list which they publish each week. In the case of first-class machines, they will arrange that, if the deal does not go through for any particular reason, they will return your machine carriage paid. This simply means that they will share with you the expense to which you have been put. They will also arrange that, if you are a little short of the money to complete the deal, you can pay the balance by instalments, on terms arranged. Hoping to sell motor cycles for cash to-day is rather a vain hope. We ourselves find it an impossibility on account of the enormous number of second-hand machines there are on the market. Still, there is no reason why you should not be able to exchange them, even if there is a glut. The "exchanging" of motor cycles is our business, and we are ALWAYS pleased to do it. At the same time, we cannot indulge in the luxury of taking in a 1911 motor cycle on the exchange system for another one of the same make—this year's model—for £5 to boot. Please get this notion out of your mind at once. For some peculiar reason we have been deluged this last week with letters from people who thought that if they paid three to five pounds down, and their last year's model, they could have the same model new this year. You will clearly understand that this is nonsense. Neither Hitchen's, of Morecambe, nor anyone else can do such a thing. We are prepared to give you a very reasonable allowance, but shall not tell you that £5 will do the trick, persuade you to send along your machine, and then tell you that "we are awfully sorry, but we shall require £15 to boot." This rot is not the class of business which appeals to us by any means. We are also not in a position to deliver a new 1912 model for £3 down, and the balance in instalments. This is another fallacy which people have in their heads, and which we wish to drive out. What we can do is to supply any machine, barring one or two exceptions, and allow you to pay from one-quarter to one-third down, and the remainder in twelve monthly instalments. Of course, we charge a small commission on this kind of business. It might pay you better to pay more than one-third down, and pay the balance off within six months, thereby getting better terms. When you write for particulars, kindly say how you are prepared to pay. This saves a lengthy correspondence, gets straight to the point, and is more satisfactory for everyone concerned.

If you are looking out for a motor cycle, do not write and ask us what we can do for you without stating whether you want to pay seven pounds or seventy, as this, of course, necessitates a letter from us asking you what you wish to spend. You are not likely to get the same class of machine for £7 as you will for £70, so that an idea of the price in your first letter is essential. Also, if you have any particular fancy, just mention it. This also saves correspondence.

We have a lengthy list, but this does not comprise the whole of our stock by any means. Do not write to ask our **cash** terms for a machine, and then tell us that you have two old crocks you wish us to take in part payment, and that you would have to pay the balance in instalments. We do not consider this to be **cash** business. Neither do we consider it to be cash when part of money is paid down, and the remainder by instalments. Don't ask us for anything like 10% off motor cycle list to be paid for by instalments, as this is another class of business that we cannot entertain. We have answered considerably over one thousand letters per week for the last month explaining to people that there is only one thing we consider to be **cash**, and that is the coin of the realm. However, we are always pleased to have your kind enquiries, no matter whatever kind they are; we can fix you up better than any others.

During the last month we have been enabled to increase our contracts, and think we shall now have quite £50,000 worth of machines coming in. This will come in at the rate of a few thousand pounds' worth per week, and we want your assistance to help us to shift it as it comes in.

At all times we are always pleased to oblige other agents where the makers make no restrictions, and we are always pleased to buy from other agents such machines as Scotts, Phelon & Moore, Morgans, chain-driven Bat-Japs, chain-driven Bradburys, Clynos, Douglases, Matchless, and Zeniths. If you are in the trade and have a client wanting a machine, we shall be pleased to have your enquiries. We are out on the jump ourselves, and hope you are the same, as we feel quite sure that the motor cycle boom for new machines is with us, and we intend to take advantage of it.

We are giving up the accessory trade, and wish to clear our stock; so if you are wanting anything, drop us a line. Of course, we shall still continue the agencies for such things as F.R.S., Lucas Lamps, Cowey and Jones speedometers, etc., etc. These we shall be pleased to supply on cash or exchange terms.

Our terms are **all on approval.** If not as specification **money back** within three days or exchanged any time. No other firm will treat you on the same terms, so you cannot do better than get on the move with Hitchen's, of Morecambe, as they are prepared and anxious to treat you well, and thereby secure your recommendation. Our stock of second-hand machines is enormous—much larger than that of any other firm; and we shall be pleased to have the pleasure of supplying you with a list of same.

If you should hear someone say that we have no new stuff to sell, don't you believe it. We have seldom less than one thousand pounds' worth of new stuff, and often the stock of new models is worth £2,000. They are all here awaiting your acceptance. Next week we have six Phelon & Moores coming through. We have also Scotts, Bat-Japs (chain drive, also with the P. & M. two-speed gear), Zeniths, Rudges F.E., Humbers, Premiers 1911 and 1912 models (both new), Clynos, Bradburys, A.C.'s, Douglas, and several more things due for this week. We are not contracting very much ahead, finding it more satisfactory to have the machines here for the shops to see. This saves a lot of complications, and saves you from having to write to the editor complaining about the unsatisfactory system of business, etc. If you will get on the telephone, or wire, we can give you an answer at once in stock or not.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

WAUCHOPE'S,
9, SHOE LANE,
FLEET ST., LONDON, E.C.

'Phone: 4777 Holborn. Wires: "Opificer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

BEDFORD.—Singer, 1911, free engine, exceptionally fast machine, touch 60, splendid condition; bargain, £40.

BEDFORD.—Triumph, 1911, free engine, good as new, not done 3,000 miles; £46.

BEDFORD.—Bradbury, 1911, standard, perfect condition, had very little use; bargain, £38.

BEDFORD.—Mills-Fulford rigid sidecar, new December, 1911, Dreadnought cane body; wife riding; cost £13/10, accept £10, bargain.

BEDFORD.—Triumph, 1909, standard engine, in perfect condition; £32.

BEDFORD.—Douglas, late 1911, 2¾h.p., good as new; owner buying sidecar machine; £33.

BEDFORD.—Triumph, 1909, engine just been overhauled, good condition; £30.

BEDFORD.—Bradbury, 3h.p., h.b.c., accumulator ignition; accept £10.

BEDFORD.—N.S.U., 2-speed gear, h.b.c., magneto ignition, new tyres; £15.—Apply, J. Crawley St. Mary's Motor Cycle Depot.

2½h.p. Minerva, accumulator, long handle-bars, low, in real good running order; £13.—Horn, High St., Heacham.

DOUGLAS, 1910, engine just returned Douglas, tyres excellent condition; £27.—Robinson's, Green St., Cambridge.

1911 Triumph, standard, 3½h.p., engine excellent, £39; standard Triumph, 1909 pattern, £29.—Robinson's, Green St., Cambridge.

CLYNOS, Clynos, 1912, 2-speed (the sidecar special); delivery March; £68/5. — Robinson's, Green St., Cambridge.

DOUGLAS, kick start, 1912, model K, in stock; £50; no waiting.—Robinson's, Green St., Cambridge.

1909 Triumph, standard model, tyres and engine first-class; £29.—Robinson's, Green St., Cambridge.

1911 Premier, free engine, Dunlops, quite new; to clear £46.—Robinson's, Green St., Cambridge.

TRIUMPH, free engine, late 1910, lamp, horn, speedometer, little used; £40.—Robinson's, Green St., Cambridge.

MINERVA, 3½h.p., Chater-Lea frame, good running order, tyres good; first cheque £10 secures.—Dunn, Abbeygate St., Bury St. Edmunds.

1912 L.M.C. Motor Cycles; immediate delivery; trial runs and interviews by appointment.—W. E. Sneezum, 14, Fore St., Ipswich. Sole agent Ipswich and district.

1911½ 3½h.p. Matchless, in good order, lamp, all accessories, new back tyre, Mabon clutch; £38, or offer.—Jackson, 20, Portugal Place, Cambridge.

2h.p. Minerva, new tank, pump, and Hellesen, requires tank levers and silencer; sacrifice, £3/10, must sell.—Richardson, 875, Woodbridge Rd., Ipswich.

REX, 5h.p., 1909-10, splendid condition, 1911 B. and B. carburetter, Bosch, all spares and accessories; bargain, £25.—17, Cardiff Rd., Luton, Beds.

PREMIER, 3½h.p., 1911 model, brand new, in crate, £37/10; similar machine, free engine, £43, not unpacked.—T. H. Nice, Ipswich and Bury St. Edmund's.

NEW Hudson; see latest models.—Agents for Suffolk, T. H. Nice, Ipswich and Bury St. Edmund's.

MOTOR Cyclists purchasing 1912 Premiers, Humbers, B.S.A., or New Hudson machines, will be allowed exceptional prices for second-hand magneto machines if ordered without delay from T. H. Nice, Bury St. Edmund's, Ipswich, or Depots.

DELIVERY from Stock. — 6h.p. Zenith, 3½h.p. Zenith, Bat 2-speed 3½h.p., 2¾h.p. Motosacoche, 4½h.p. Excelsior. — Sole agents: Knaster and Cox, Cambridge.

MORGANS, Morgans,—4 left; best offers.—Knaster and Cox, Cambridge.

1911 8h.p. Bat, new in August, £45; 1911 F.E. Triumph, £40; 1909 3½h.p. Excelsior, £22; 3½ h.p. W. and P., magneto, £13: 1¾h.p. Motosacoche, £18, magneto; 3 tricars, 2-speeds, Rover and Humber; must clear; best offer.—Knaster and Cox, Cambridge.

3½h.p. N.S.U., magneto, recently overhauled by makers, perfect condition, spares, good tyres, Riches tubes; accept £20, or near offer.—J. Riches, 22, Howbury St., Bedford.

2¾h.p. Grandex-Precision, new August, 1911, in splendid condition, not done 500 miles, Palmers, also spare studded Warwick, new; £25.—W. E. Hart, Bury St., Stowmarket, Suffolk.

LATE 1911 3½h.p. Rover, free engine model, brand new December 15th last, been used few times only, not scratched, everything like brand new, classy machine, horn, lamp, tools; £46/10.—Wallis, grocer, Hills Rd., Cambridge.

1912 L.M.C. Motor Cycles, 3½ and 4h.p., immediate deliveries; all models in stock; catalogue and best terms.—W. E. Sneezum, 14, Fore St., Ipswich, sole agent Ipswich and district, including Felixstowe, Walton, Woodbridge, Melton, Wickham Market, Framlingham, Hadleigh, Needham Market, etc. Trials and interviews by appointment.

MOTOR BICYCLES FOR SALE.

SECTION VI.

Worcestershire, Herefordshire, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

3h.p. Roc, low, h.b.c., in good order; £15.—193, Cowbridge Rd., Cardiff.

BRADBURY, 1911, as new, Autoclipse lamp, horn, watch, tools; £35.—Edmund Williams, Bromyard.

RUDGE, 1911, T.T., F.E., in excellent running condition; £42.—Passey and Hall, Ltd., Ross, Herefordshire.

6h.p. Zenith-Gradua, Sept., 1911, done under 700 miles, perfect as new; £49/15.—Clarke's Garage, Port Talbot.

1910 Phelon and Moore, 2-speed, re-enamelled and overhauled, new Kempshall back tyre; £38.—Below.

4-CYL. F.N., just overhauled and re-enamelled, nearly new, Palmer cord tyres; £18/10.—Below.

MOTO-REVE Twin, 1911, as new; cost £45/3, £28/10.—Below.

DOUGLAS Twin, 1910, reliable; £23/10; and many others.—Clarke's Garage, Port Talbot.

DELIVERY from stock, Zenith, standard Triumph, T.T. Triumph, F.E. Triumph, T.T. Rudge, 3½h.p. Singer, and B.S.A.—Clarke's Garage, Port Talbot.

FOR Earliest Deliveries of Triumph, Humber, Enfields, Singer, Premier, apply at once, Griffiths, Cycle Emporium, Llanelly.

DOUGLAS, 1910, tyres as new, B201 saddle, lamp, generator, horn, tools; bargain, £22.—Passey and Hall, Ltd., Ross, Herefordshire.

2h.p. Minerva, good running order, B. and B. carburetter, h.b.c., spring forks, lamp, horn; £9/10.—Planet Motor Works, Newport, Mon.

ZENITH and Scott Motor Cycles.—Sole agents for Glamorgan and Monmouthshire (excepting Port Talbot): Burrelli, Ltd., 2, Albany Rd., Cardiff.

1912 6h.p. Zenith, actually in stock, immediate delivery.

SCOTT, 3½h.p., late 1910, guaranteed in good condition; £58.

3½h.p. Lincoln Elk, 1912, latest variable jet, B. and B. carburetter, waterproof Bosch magneto, etc.; £34.

WRITE for list of further machines for sale to Burrelli, Ltd., 2, Albany Rd., Cardiff.

1910½ Triumph, perfect condition, P. and H. lamp, Jones speedometer (trip mileage), exhaust whistle, spares; £38.—Williams, 67, Gwydr Crescent, Swansea.

TRIUMPH, 1909, for sale, in splendid condition, almost new, steel studded back tyre, new belt; price £26/10.—Jones, Victoria Garage, Milford Haven.

RUDGES, 1912, free engine, £55; Humber, 3½h.p., 2-speed, new August, 1911, £38; F.N., good condition, £12; Vindec Special twin, £25.—Bladder, Worcester.

T.T. Humber, 2¾h.p. twin, 3 speeds and clutch, late 1911, condition as new, spare roadster handle-bar, horn, etc.; cost £54, accept £37.—Whorton and Hartill, Motor Depot, Dudley.

TRIUMPH, 1909 (September), new rubber belt, Clinchers, numerous spares, Lucas Acetaphote, complete, perfect; £30, or nearest; approval willingly.—Tregaskis, Taffs Well.

CLYDE, 3½h.p., magneto, h.b.c., B. and B. carburetter, Dunlops, enamelled grey, 2 spare tubes, lamp and generator; bargain, £12/10.—Blundell, Burcot Grange, near Bromsgrove, Worcestershire.

TRIUMPH, clutch model, August, 1911, as new, £45; 1909 Triumph, £29; 1910, £34; Arno, £20; Lincoln Elk, with Mabon, £24; twin Enfield, £20; twin Moto-Reve, £16; clutch Kerry-Abingdon, quite new, £44; B.S.A., clutch, nearly new, £45; offers invited.—Crannore, Redditch.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks Wilts, and Hants, and Channel Islands.

1912 2¾h.p. New Hudson, 3-speed, just delivered; cash offers.—Bennett, West St., Fareham.

TRIUMPH, 3½h.p., 1908, magneto, all accessories, excellent condition; £29.—7, Fleet St., Swindon.

1911 New Bradburys, standard and 2-speed models; bargain prices, cash offers. — Ginger, Motors, Banbury.

TRIUMPH, 3½h.p., splendid condition; £25; spares.—Smith, 3, Albion Terrace, Park Rd., Farnboro', Hants.

TRIUMPH, 1910, standard, excellent condition, new Palmer back wheel; honest value, £30.—Layton's, Bicester.

TRIUMPH, 1911, standard, done 2,000 miles only, and not been used last 5 months; £38.—Layton's, Bicester.

TRIUMPH, 1911, T.T. roadster, not done more than 1,000 miles, as new; lucky if you get it; £40, or near offer.—Layton's, Bicester.

Contributions to Club Prize Funds.

SECRETARIES of motor cycle clubs will be more than usually interested in the latest decision of the Manufacturers' Union regarding the method that this body proposes to adopt for dealing with trade contributions to club prize funds. Applications to makers from club secretaries for contributions to their prize fund will be referred to the Secretary of the Union, who will point out that the members of that organisation have pledged themselves to support only those events which are restricted to *bona-fide* private owners, members of the organising club or neighbouring clubs.

Contributions to ten of the most important events of the year will be made without the restriction regarding private owners, but no contribution will be made to any open event which is not authorised by the Auto Cycle Union, and such contributions will only be awarded to whole day events, and will not apply to hill-climbs and other competitions which take place in the afternoon.

The above arrangement will secure uniformity in the distribution of prize funds, but it will prevent many clubs from holding open competitions unless they are willing to find all their own prizes without depending on the trade for assistance.

Many clubs run their yearly competitions, and particularly their closed events, without applying to the trade for donations, but in the case of big open events it is customary to look for such help.

The trade view is that open competitions are being overdone, and that no good purpose is served by the same trade riders competing against each other practically every week. This is a view which we have urged on many occasions, not because we wish to disparage the trade riders in the slightest degree—in the majority of cases they are excellent fellows and thorough sportsmen—but on account of the gradually growing discontent among ordinary club members that they have no chance against expert trade riders when they are competing on level terms.

In course of time club life must suffer if the same coterie of riders win all the best prizes. If the manufacturers' proposals stimulate competition among club members it will be a good thing.

At the same time there is another view of the question which should not be overlooked, *i.e.*, whilst the Manufacturers' Union confines its attention to conditions which are purposely directed towards encouraging the ordinary member to take more interest in his club events it will render good service, but if its efforts go further and tend to curtail the number of competitions, the reverse will be the case. However, we are assured that its present most laudable desire is to encourage club life and competitions amongst club members only.

The above scheme, as regards makers of complete machines, is already in operation, and the Manufacturers' Union, through its secretary, is now in communication with all the motor cycle tyre and accessory manufacturers, who have been informed of the decision arrived at by the machine makers' section, and asked for their views on the question with an idea of similar conditions being arranged in their case when applications are made to them for contributions to club prize funds.

Of course there are a few clubs in the country which will not be affected in the slightest by the scheme outlined above, as they never solicit in any direction for contributions to their prize funds.

OUTSIDE FLYWHEELS.

AT the last Olympia Motor Cycle Show there were two or three new-comers exhibited with outside flywheels, and it is to discuss the pros and cons of this design that the following article is penned.

The points usually raised against the outside flywheel are mud-throwing, the difficulty of fitting an adjustable pulley, wear on bearings, and, occasionally, the effect of gyroscopic action on the steering. This last may be dismissed without going into details, as, after riding various outside flywheeled machines for the last seven years, the writer has never once noticed this trouble on any of the several makes which he has had under observation.

It is true that the flywheel is apt to throw mud, but not to the extent that might be imagined, for the rim speed is so high that it cannot pick up much mud; besides this, the wheel can be neatly protected from mud by a light underscreen.

The Adjustable Pulley Difficulty.

The difficulty of fitting an adjustable pulley has been a stumbling block for some time, but this trouble is not insuperable; in fact, during the past year an experimental machine has been on the road fitted with an outside flywheel and an adjustable pulley, which is considerably simpler to adjust than the average pulley as at present fitted. At the time of writing details are not obtainable for publication, as the patents are not yet completed. Wear of crankshaft bearings is a point very freely raised, but experience of well-made machines tends to prove that, if properly designed, the crankshaft bearings on an outside flywheeled engine last at least as long as those with inside flywheels. Quite recently I saw an outside flywheeled engine stripped after more than four years' hard work, and the crankshaft bearings were apparently as good as the day they were put in.

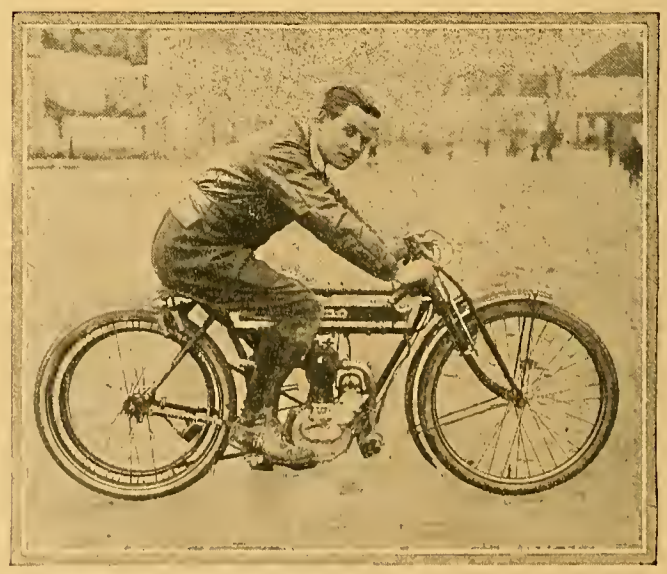
Now, the advantages of the outside flywheel are many. Firstly, a flywheel with a larger diameter can be employed and the weight placed well in the rim. This allows the total weight to be considerably reduced, though the flywheel effect is the same. Secondly, there are no internal wheels to churn up the oil, and consequently throw it away from the big end bearing. Thirdly, with this design split big ends and one piece crankshafts are usual, both of which have decided advantages, for the split big end can be easily taken up when wear occurs, while a one piece crankshaft cannot be erected out of line if it is turned out correctly in the first instance.

A Few Instances, Ancient and Modern.

From very early days we have had successful outside flywheeled machines, and the old brigade will remember the Clément-Garrard and 2¼ h.p. Buchet, both of which were very good machines in their day. In more recent times, the twin Premier made two or three of the fastest laps in the Tourist Trophy of 1910. The little Douglas has earned for itself a great and well-deserved reputation. The sweet running F.N. has had an outside flywheel for years. And among promising newcomers we have the Veloce and Levis, also the Wooler, of which we hope to hear more later.

Extremely good running at low speeds is a feature of all well-designed outside flywheeled engines, but it must be remembered that the size and weight of the wheel can be considerably overdone, and when this is the case the machine will not accelerate quickly.

I cannot refrain from mentioning a short conversation overheard at the 1910 motor cycle show. A pseudo-technical customer was complaining of the skin friction caused by an outside flywheel revolving at high speed in the air. This struck the poor tired salesman (who is by no means an unknown figure in the motor cycle world) as going rather a long way to find trouble, and he remarked, "Yes, sir, but we can easily fit a lubricator for you."



Apparently there is a popular prejudice against the outside flywheel, as many of the arguments brought against it have little more in them than the above.

This article is not intended to be a wholesale condemnation of the usual type of engine, but merely to try and convince readers that, because a machine is fitted with an outside flywheel, it is not necessarily a freak, but may have many good points. Surely car manufacturers have reasons for placing the flywheel on the end of the crankshaft and *outside* the chamber.

Oil Throwing.

While I write I am reminded of another alleged trouble, *i.e.*, the throwing of oil from the main bearings. After constant use of both types of engine, I can truthfully say that I have never found one type worse than the other in this respect, and I cannot see why the outside flywheel should be accused of this vice. In almost every instance the pulley covers the end of the crankshaft bearings, entirely protecting the flywheel from oil ejected therefrom. On the other hand, outside flywheeled engines are usually fitted with a long plain bearing, which is obviously a better oil-retainer than a ball race, especially if fitted with felt caps and other devices usually employed to make a reasonable oil joint where ball races are used.

UBIQUE.

Rox G. Mundy (2¼ h.p. Singer), second in the lightweight class of the hill-climb at Montanglaust, Franco, last week. Mundy had collecting pipes fitted to both inlets of the carburetter, but very little if any improvement in speed resulted thereby.

The Future of Engine Design.

By A.M.I.C.E.

SPEAKING to a friend recently, I asked his opinion of the future of the motor bicycle. Jestingly, but at the same time expressing his serious opinion, he replied, "There isn't to be a future," and argument failed to move his conviction that the motor cycle would be improved out of existence.
